ume of *Indian Thought* also appeared. Though more technical and difficult than the first volume, its breadth and clarity, and its detailed comparisons of Indian and European systems (a procedure which most writers on Indian philosophy avoid) make it an invaluable source of information concerning systems of thought with regard to which most Westerners are completely ignorant. The section devoted to *The Vedanta* is particularly instructive and quite comprehensible to lay readers.

The ninth volume of the *Jahrbuch für Philosophie und Phänomenologische Forschung* published during the year contains three essays. The more important ones are: Ludwig Landgrebe's exposition of Dilthey's *Sciences of the Mind*, (*Geisteswissenschaften*) and Husserl's lectures on the *Phenomenology of the Inner Consciousness of Time*. Dilthey, who has a great reputation in Germany, is here presented as one of the founders of the *Geisteswissenschaften*. His doctrine that all knowledge is nothing but a sort of self-consciousness and his related theory that all systems of thought are merely a function of the culture in which they develop are competently expounded. Husserl's lectures on the consciousness of time combine the insights of Bergson and Whitehead with the rigor and thoroughness of the strict phenomenological method. They constitute an indispensable completion of the famous treatment of intentionality (*Intentionalität*) in the last two *Logische Untersuchungen*.

Martin Heidegger, who is indebted to both Husserl and Dilthey, published his long essay *Sein und Zeit* in the previous *Jahrbuch*. An interesting novelty in Heidegger's system is the concept of *care* (*Sorge*) which he introduces in place of Husserl's *intentionality*. It is through care or anxiety that we know the past and the future, and it is anxiety which, in an almost pathological way, builds up our whole system of knowledge. The preference for a concrete concept like *care* is characteristic of Heidegger as contrasted with Husserl.

The publication of Martin Farber's book, *Phenomenology as a Method and as a Philosophical Discipline*, should serve to make Husserl better known to English readers. It is a brief but competent book and contains a number of useful comparisons of phenomenology with other systems of philosophy.

One very important event of the year in the philosophical world was a translation of Edward Spranger's *Lebensformen* (*Types of Men*). This book, occupied with the general field of synthetic psychology and ethics of personality, is noteworthy in itself and representative of a whole school of German philosophy. For the first time English readers are afforded an insight into *Geisteswissenschaft* and the phenomenological analysis of historical essences. The science of the soul, in the sense of *geisteswissenschaftliche* psychology, had its beginning in Hegel's *Phenomenology of Mind*, one of the most famous and influential books of the century. The same phenomenological studies have been carried on by Dilthey, Scheler, Spranger, and a host of others. *Geisteswissenschaft* is very closely related to Husserl's phenomenology. The difference between Husserl's phenomenology and theirs is that he is concerned with logical essences and with those essences of language, meaning, perception, etc., which admit of the same rigorous treat-

ment, while *they* are occupied with historical-psychological forms and structures, which require a somewhat different method. For while their essences are concrete and temporal, Husserl's, though sometimes relating to time, are really static and timeless. But however these two phenomenologies may differ in other matters, they are agreed in this: that systems are to be built up, not through induction or deduction, but by pure description of the essences embedded in experience and discovery of the necessary connections between them.

Spranger's work, which is based on Dilthey and ultimately on Hegel, shows also some neo-Kantian influence. Like Dilthey, he sought to lay the foundations of the *Geisteswissenschaften*. His particular contribution is the introduction of "types of men," striking and characteristic men who epitomize in themselves a whole movement or epoch. Knowledge of these historical "types" or essences is to be obtained by an act of historic æsthetic empathy (*Einfühlung*). If we are to understand the deeper, more fateful parts of history we must feel ourselves into not only the life and modalities of our hero but that of his whole cultural environment. Nor should one attempt to interpret a "type" in terms of one value exclusively. The American may be primarily economic, but to treat him as an economic animal, pure and simple, would be to neglect his theoretic, social, æsthetic, and religious motives and his will to power. There are six types of men in which either theoretic, economic, etc., motives predominate, but the types are not pure.

Most history narrates the life of individuals with all its accident and irrelevance. Such history can have no laws since the relation between a particular individual and objective institutions is fortuitous and impermanent; but if history occupies itself with essences, types of men, then laws are possible. The man of power, of which Napoleon is an example, may have objective and necessary relations to Art, Science, or Religion. With the developments of Hegel, Dilthey, and Spranger, history becomes a science with generality and laws like any other; but the science can only be advanced according to Spranger by the elimination of the oneness of previous systems. "Progress may be hoped for," he says, "only through a union of the historical sense with clarified *geisteswissenschaftliche* psychology."

Another important contribution of the year is the English translation of the second volume of (*Der Untergang des Abendlandes*), Spengler's *Decline of the West*. The basic concepts of Spengler: Culture (Apollonian, Magian, and Faustian), Civilization, and the biological metaphor of the growth and decay of Cultures are already well known to English readers through the first volume. It is interesting that Spengler agrees with Spranger in regarding all historical processes as relative to the observer, but disagrees with him in the matter of human freedom. Spengler carries his relativism to great lengths. "Every living being," he says, "livingly experiences every other being and its destiny only in *relation to itself*." This relativism would seem to apply to every one but Spengler himself. He alone transcends time and space and judges of things with an impartial eye, deducing the course of history and predicting the decay of cultures. Individual cultures, he maintains, have a necessary development. Only the relation between these cultures is accidental and indeterminable. A brilliant ex-

ample of this is the interruption in the development of Mexican Culture by a handful of barbarians. Since the life of the individual in his culture is preestablished, there can be no human freedom. Spranger holds in opposition to this that human freedom renders prediction in history impossible. As to the future of human groups, the question is not what *must*, but what *ought* to be.

The preoccupation with Phenomenology and *Geisteswissenschaft* in Germany was paralleled by an increasing interest in logic in England and America.

Paul Weiss contributed an interesting article in *Mind* in which he attempts to solve some of the paradoxes involved in the theory of types (Whitehead and Russell). According to Russell's theory of types it is impossible to make significant assertions about *all* propositions, and yet Russell himself is obliged to make such assertions in order to establish the hierarchy of propositions. Weiss concludes that the theory should be modified and therefore sets himself to solve a number of the "type" paradoxes, with a view to justifying a certain range of unrestricted propositions. He concerns himself principally with the "heterological-autological paradox." Autological words express properties they possess and heterological words properties they do not possess. But the word "heterological," if it possesses the property of autologicality, belongs to the class of heterological words; if it possesses the property of heterologicality, it belongs to the class of autological words. This paradox is solved by the consideration that one word may belong to two apparently mutually exclusive classes, if the classes are determined in a different way. "Heterological" belongs to the first class by virtue of a certain relation, to the second by virtue of *property* it possesses. Weiss would attempt a similar solution to other and more serious paradoxes. The paper throws some light on the very puzzling, much disputed problem of "types."

F. S. C. Northrop, in an article for *Monist* makes a plea for symbolic logic which is quite characteristic of the changing interest. He maintains that the old Aristotelian logic with its calculus of classes, though pedagogically valuable and important in itself as a special case of logic, should not be identified with the whole of logic, relations, functions, and propositions being every bit as fundamental as classes. Aristotelian logic shows its weakness, he holds, even in the matter of immediate inference. Thus, "All just acts are expedient acts," though consistent with, "All unjust acts are expedient acts," can be proved inconsistent with it on the older principles of immediate inference. The paper contains interesting graphs, borrowed from Professor Sheffer, showing the contrast of Aristotelian and Boolean logic.

The logical foundations of mathematics have been recently brought to attention by the criticism of L. E. J. Brouwer. The intuitionism of Brouwer is opposed by the formalism of Hilbert. In this discussion of the foundations of their subjects, mathematicians have become philosophers in spite of themselves. Frege, Peano, Whitehead, and Russell have insisted on the priority of logic. Brouwer not only denies the logical basis of mathematics but questions the laws of logic themselves. Arnold Dresden and James Pierpont in the *Bulletin of the American Mathe-*

matical Society give an interesting account of Brouwer's rejection of the Law of Excluded Middle. Extensive false theories, he says, have been erected on this principle and it has been given an undue extension to sets which are not finite. The rejection of the Law of Excluded Middle has great consequences in mathematics. For one thing the system of real numbers is not "ordered" and many proofs become invalid. The question of the unlimited applicability of this principle is very much involved in Zermelo's theorem and the existence of selections from all classes of classes. Professor C. I. Lewis discusses "Queer Systems" in which some of the laws of logic are omitted. Other philosophers have become very much interested in the possibility that there are "twilight zones" in which reality is only partly determined and dichotomies are out of the question. Professor Whitehead believes that the Law of Excluded Middle precludes a satisfactory theory of change and Professor Dewey thinks the principle often impracticable.

The validity of this principle is also involved in McTaggart's theory of "Determining Correspondence" (*The Nature of Existence*), by means of which he "disproves" the existence of Time and all substances which are not Spiritual. Substances to exist must be capable of division into parts of parts to infinity and these parts must have sufficient descriptions. The question now is whether each of these parts is either *a* or *not a* and can be determined by a sufficient description as a certain part of a broken line of a primary part of the substance. McTaggart denies that sufficient descriptions can be found for other than spiritual substance and thus disproves their existence. John Wisdom, in a brilliant article in *Mind*, disproves McTaggart's subtle and very consequential theory of Determining Correspondence, but in a manner that is too technical to be repeated here.

Another article in the same issue of *Mind* by R. M. Blake attacks McTaggart's theory, or rather dismissal, of propositions. McTaggart had held in *The Nature of Existence* that judgments when they are true correspond to facts and that there is thus no need to assume propositions as well. Professor Blake points out that judgments are temporal events and that therefore on McTaggart's theory, truths are only true when asserted and the same truth (such as $2 + 2 = 4$) cannot be asserted twice over. Hence, truths are not eternal and cannot be shared by different minds. Professor Blake's attitude here is representative of a widespread revival of Platonism, a movement largely inspired by G. E. Moore and the early Russell.

The general interest in Spinoza, so much in evidence the last few years, was doubtless to be increased by a new and very comprehensive treatment of this philosopher by Richard McKeon. *The Philosophy of Spinoza* is a thorough-going, scholarly work containing a detailed account of Spinoza's relation to experimental science, and experimentalists such as Boyle, and a competent chapter on "God and the Universe" in which the relation of Substance, Attribute, and Mode are explained with great subtlety and interest.

The recent popularity of Spinoza is another indication of the spread of Rationalism. In Germany, Rationalism turns to Kant and Hegel, in France, to Descartes. In America, Spinoza has become a leader who is making headway in many places, against the prevailing Pragmatism.

. BIBLIOGRAPHY. During 1928 the following notable contributions to philosophy and philosophical discussion appeared: L. Adams Beck; *The Story of Oriental Philosophy*; E. A. Burtt; *Principles and Problems of Right Thinking*; J. Chevalier, Henry Bergson, Martin Farber, *Phenomenology as a Method and as a Philosophical Discipline* (University of Buffalo Studies); S. Z. Hasan, *Realism*; Edmund Husserl, "Phänomenologie des Inneren Zeitbewusstseins," in *Jahrbuch für Philosophie und Phänomenologische Forschung*; H. A. Larrabee; *What Philosophy Is*; Richard McKeon, *The Philosophy of Spinoza*; S. Radhakrishnan, *Indian Thought*, vol. ii; Joseph Ratner, *The Philosophy of John Dewey*; Bertrand Russell, *Skeptical Essays*; Oswald Spengler, *The Decline of the West* (second volume); Edward Spranger, *Types of Men*; H. O. Taylor; *Human Values and Verities*; Frederick Ueberweg, *Grundriss der Geschichte der Philosophie*, fifth part; A. N. Whitehead, *Symbolism: Its Meaning and Effect*. In addition there were notable papers published in *Mind*, *The Monist*, *The Journal of Philosophy*, and in other philosophical periodicals.

PHONETICS. See PHILOLOGY, MODERN.

PHONOGRAPH. See MUSIC.

PHOSPHATE ROCK. The phosphate industry throughout the world was on practically the same basis in 1928 as in the previous year. It was reported that in Russia searches were being prosecuted for high-grade phosphates and there were plans to develop known deposits which were situated favorably for working. Morocco was active during the year sending several thousand tons to the American market at a price said to be below that for the same grade from Florida. In the United States the production of domestic phosphate rock was 3,439,921 long tons, valued at \$12,339,850, or 8 per cent more in quantity and 10 per cent more in value than the production of 1927 as reported by the U. S. Bureau of the Mines, namely 3,170,699 long tons, valued at \$11,253,352. The United States both imported and exported phosphate rock, the imports in 1927 amounting to 28,195 long tons, valued at \$292,871, and the exports, 918,211 long tons, valued at \$4,731,562. The export figures for 1928 were on approximately the same basis, with exports of 92,517 long tons of high-grade hard rock valued at \$626,238, and 806,247 long tons of land pebble and other phosphate rock, valued at \$3,826,863. Most of the exports from the United States went to Europe, but American exporters were beginning to fear competition from the producers of North Africa.

There were published during the year by the U. S. Bureau of Mines descriptions of experiments in flotation of low-grade phosphate ores which indicated the successful application of this method and the treatment of phosphate rock. Unground sand figured in tests in which from 90 to 95 per cent of the phosphates were recovered affording concentrates of commercial grade or a product that required but a single treatment to make it marketable. At various plants in the United States there were extensions of facilities for the manufacture of phosphoric acid and various phosphates for technical and industrial use. At Nashville, Tenn., and at Columbia, Tenn., the Victor Chemical Company and the Armour Chemical Works were building new plants for the manufacture of phosphoric

acid by the sulphuric acid process, a method being used by five companies in the United States. Florida and Tennessee continued as the leading producers of phosphate rock, the output of the former in 1928, 2,821,961 long tons, being valued at \$9,324,306, and of the latter, 577,095 long tons, at \$2,853,237. See FERTILIZERS.

PHOTOGRAPHY. Although there were no outstanding results of theoretical interest in photography published during 1928, two practical developments commanded attention. These were the extraordinary progress in research work on the recording of sound in conjunction with motion pictures, and the successful demonstration and introduction of a process of natural-color motion pictures for the amateur. The former resulted in a certain drastic revision of motion-picture-production technic, an influx of electrical, acoustic, and mechanical engineers into the motion-picture industry, and a stricter supervision of chemical development of negatives. The other development made possible the dream of every photographer over the last half-century of a simple process of photography in natural colors.

Two notable scientific gatherings convened during the year—the Seventh International Congress of Photography which met in London, July 9–14, and the Second International Congress of Radiology held July 23–27, in Stockholm. Progress was made at the London gathering toward an international standard photographic unit of intensity for the sensitometry of negative materials when a report was read on this subject.¹ The unit proposed was one visual candle power of sunlight quality. The Congress, however, decided to define the unit in terms of a standardized light source and filter, the combination giving radiation of approximately sunlight quality. Another valuable step was the series of proposals made by the Cinematographic Committee relative to characteristics of motion-picture film.² The Eighth Congress was planned to be held in Dresden in 1931.

The Radiology Congress was attended by nearly one thousand members from 40 countries. The two lasting achievements of this meeting of photographic interest were: (1) the unanimous adoption of proposals for standards of protection, and (2) the approval of a standard international unit of X-ray intensity.³ The Third Congress was arranged to be held in Paris in 1931.

APPLICATIONS OF PHOTOGRAPHY. For over a half-century the wet collodion process has been used as an essential step in the preparation of half-tone negatives for reproduction. By 1928 it was being displaced rapidly by a gelatin-coated paper called strip-film paper.⁴ Another important development in the photo-mechanical field was the continued increase in the use of color in advertising which depends to a great extent on photography since the various hand processes, wood engraving, lithography, etc., are all too slow or too costly and they often do not give a realistic impression.⁵

There had been a number of notable improvements in methods of offset and color roto-gravure work.⁴ Pictorial telegraphy was used daily in the service of illustrated journalism and methods were being tested of receiving pictures in the form of half-tone dots to be printed down directly on to zinc plates. Another promising photo-composing machine called the "Luminotype" was in-

introduced which sets seven thousand letters per hour.⁶

As previously noted, methods for the reproduction of sound represented the greatest advance in the art of motion pictures during the year 1928. Ten different systems were known to be in use, and over eight hundred theatres had been equipped with sound reproduction devices.⁷ Two distinct methods of sound recording were being used, namely (1) wax-disc recording, and (2) photographic recording. Two types of photographic records were being made commercially: (a) variable density, an example of which is the "Movietone," and (b) variable width, represented by the "Photophone" process. The photographic records are made by converting the electrical impulses produced in the microphone into light modulations which are impressed on the film. The sound is recorded either on the same film as the negative picture, or else on a separate film. On the positive used for projection, the sound record appears as a narrow area along one edge of the film. To reproduce the sound, light from a concentrated filament lamp is projected through the film upon a photo-electric cell. The electrical modulations from the cell are then amplified and led into a loud speaker to reproduce the sound.

One producer built a series of recording studios in California costing several millions of dollars during a period of ninety days.⁸ A symposium on sound motion pictures was held by the Society of Motion Picture Engineers, the papers filling an entire number of its *Transactions*.⁹ Four types of sound pictures have been classified by Millikan:¹⁰ (1) musically scored pictures; (2) pictures with songs; (3) news reels; (4) dialogue pictures.

The Academy of Motion Picture Arts and Sciences organized in Hollywood, Calif., in 1926 was proving a stabilizing and constructive influence to the industry. In the Academy's annual report¹¹ mention was made of the efforts that had been directed toward the establishment of college courses in motion-picture technology, the drawing up of actors' contracts, the arbitration of disputes, and the publication of experimental results. Academy Report No. 1 summarized the results of extensive experiments relative to the use of incandescent illumination. A Technical Bureau was initiated by the Association of Motion Picture Producers as a nucleus of a research laboratory for the industry.¹²

A comprehensive production programme of motion pictures for educational use was under way. Favorable results were announced of a two-year experiment in the use of films as adjuncts to teaching.¹³ A series of medical films was being produced in America under the direction of the American Medical Association and analogous work was in progress in France.¹⁴ These films were to make available the technic of the world's leading surgeons for class-room instruction. Many of the educational and medical films were being made available in the 16mm sub-standard width. The Film Foundation was formed at Harvard University for the preparation, assemblage, and distribution of education and cultural films.¹⁵

Interest in amateur cinematography was well shown by the world-wide circulation of an American publication dealing with this subject, the organization of additional clubs for the promotion of amateur film productions, and the increase and demand for the products of film libraries.

The basic principles of a new amateur process of color cinematography were worked out by two Frenchmen, R. Berthon and A. Kellor-Dorian, between 1908 and 1923. In 1925 the Kodak Company secured world rights on the patents for 16-mm. use, announcing the process on July 30, 1928, under the name *Kodacolor*.¹⁶ This process involves the use of a three-color filter on both the standard amateur camera and projector. Panchromatic film, embossed on the support side with minute cylindrical lens elements, is threaded in the camera with the support side toward the lens (opposite from normal threading), so that the lens elements image the light passing through the filters.

The embossed lenses guide the rays from the filters and impress one, two, or three images on the film according to whether one, two, or three of the filters transmit the light reflected from the subject. On development by the reversal process, a monochrome record is produced which resembles the ordinary black and white positive record. When the film is projected, light passes through the embossed lenses, through the picture, through the projector lens, and finally through the color filters which recombine the colors to reproduce the natural colors of the original subject.

Besides this major development there were published descriptions of several other color processes and more than thirty patents. Three different tri-pack processes were described, two of which were being used commercially.¹⁷ A method of making color prints on paper somewhat analogous to the Carbro process found some favor.¹⁸ Details for realizing kaleidoscopic effects with a two-color motion-picture process were discussed.¹⁹

The advances made in measurement and standardization of X-ray dosage was of interest in regard to the photographic, as well as the therapeutic, uses of X-rays. Important new data had been obtained on X-ray protection.²⁰ A method of actuating the X-ray tubes by motor impulses of the body is valuable in that photographs may be exposed at a certain instant in the cycle of various organs, such as the heart, stomach, etc.²¹ The use of intensifying screens was increasing and certain modifications were noted. Progress had been made with industrial applications of X-rays in the analysis of cellulose compounds, inspection of welds in ocean liners, extent of decay in living trees, etc.

Besides these specific applications of photography, there were numerous notable advances made in connection with astronomy, photomicrography, aerial photography, engineering, vulcanism, detection of false documents, etc. These and other special uses indicate the increasing importance of photography as a recording medium.

PHYSICAL MEASUREMENTS. In studying the properties of photographic materials, physical measurements are of utmost importance and it was encouraging to note the efforts being made during 1928 to adopt international standards in types of equipment, methods of measurement, and expression of results. Besides the unit of intensity for sensitometry previously mentioned, there was evidence offered that in the calculation of speed numbers of sensitive materials, the gradient of the *underexposure* part of the characteristic curve should be used instead of the *normal inertia* value.²² This method would give a value conforming more nearly to the usage of modern films. An effort along similar lines was the

suggestion of the use of a high intensity time-scale sensitometer for measuring photographic speed under conditions directly comparable with those existing in the camera.²²

A standard developer was proposed for international sensitometric work²² and two devices described for producing uniform development.^{22,23} A systematic nomenclature in photographic sensitometry was proposed as there was some confusion and inconsistency in existing terminology.²² Of considerable scientific interest were the contributions of the Russian investigators, notably those of Chibisof and Cheltsof relating to sensitometric characteristics, filter factors, and analogous problems.²⁴

Further data was compiled on the resolving power of photographic materials^{22, 25} which, besides its astronomical value, had an especial bearing on the photographic recording of sound. The photo-electric cell was used in several types of *densitometers* with good results. Exposure meters also were devised; one uses a selenium cell and others work on the well-known extinction principle. A rather novel departure was a meter which uses the light given by the impact of radium emanation on zinc sulfide.²⁶ One commercial printer employed a photo-electric cell to determine the correct exposure for printing amateur negatives.

Since the publication in 1927 of the comprehensive survey of the contrast characteristics of photographic papers, L. A. Jones summarized these results in a short article pointing out the factors upon which the value of contrast is dependent.²² Two general papers by the same author deal with reflecting power of colored objects²⁷ and the use of light filters,²⁸ respectively; these are of particular importance in relation to the extensive use of panchromatic film stock for motion pictures.

MANUFACTURE OF SENSITIZED MATERIALS. A survey of the patent literature reveals a great many disclosures of processes related to the preparation of acetyl cellulose and its derivatives to make *safety* film base. Extensive use of such base for amateur cine film and the demands for slow-burning stock from other sources have undoubtedly helped to stimulate this field of research. One series of patents relates to the incorporation of the silver halide in a viscose layer, thus eliminating a gelatin coating.²⁹ A method of making cellulose-acetonitrile, combining desirable properties of both nitrate and acetate support, is described.³⁰ Panchromatic film in 16-mm. width has been made available for the cine amateur.³¹

Physical properties of gelatin were being studied more extensively with reference to the suitability of various gelatins for different photographic materials. Certain protein extracts were patented as sensitizers for gelatin. Emergence of emulsion making from a secret empirical art may be indicated by the publication of papers dealing with various phases of emulsion technic and of patents disclosing certain procedures.³² Further patents on ways of preventing static and halation by incorporating certain materials in the film support are of interest.³³ A series of papers described the preparation and probable structure both of optical sensitizer³⁴ and desensitizer²² dyes.

An ultra-rapid X-ray film was produced by incorporating a material in the backing which becomes luminous on exposure to X-rays.³⁵ This

combines the X-ray screen and the film emulsion into one unit. A great many patents described light-sensitive diazo compounds and allied substances.³⁶ Papers coated with these compounds and a coupling agent are used as substitutes for blue-print paper. Inclusion of a weak organic acid prevents the two chemicals from reacting to form a dye, but if this acid is neutralized by treating the paper with ammonia gas, the dye is formed. When exposed to light, the diazo compound is decomposed and no dye is produced by the ammonia treatment. The process is therefore a method of producing positive images directly. Several papers dealing with the chemistry of diazo and other special printing processes were given by Spencer before the London International Congress.³⁷ A motion-picture film of extreme thinness, known as Ozaphane, was being used commercially in Europe.³⁸ It consists of a diazo compound incorporated in a thin viscose layer. A gelatin-coated film sensitized with ammonium bichromate for use in various processes of color photography is available.³⁹

NEW APPARATUS. Each year there are more mechanical or automatically controlled devices introduced for photographic use. The year 1928 was no exception. From the maze of patents listed relating to improvements in apparatus, certain ones, such as additional spring-driven amateur cine cameras and automatic developing machines, stand out. In the latter class are found numerous coin-actuated devices which expose photographs, develop, and deliver the prints, and sometimes even negatives and enlargements.⁴⁰ A few machines for the continuous processing of standard motion-picture negatives were adopted.⁴¹ This marked an important advance in the motion-picture industry as the processing of valuable negatives is an extremely critical operation.

The extensive use of panchromatic film resulted in the adoption of incandescent lamps for much of the photographic work, thus necessitating redesigning of these lamps.⁴² Not to be outdone, carbon arc manufacturers developed "pan" carbons, the cores of which contain rare earth metals which give a wide range of spectral illumination.⁴³ A combination mercury vapor and neon gas lamp also was claimed to be a satisfactory illuminant for exposing panchromatic film.⁴⁴ Sound motion pictures resulted in the introduction of many new pieces of apparatus in the motion-picture studio.

A continued increase in interest in amateur motion pictures was evident. The amateur was deluged with all sorts of new devices to assist him in his quest for novel effects and in editing and projecting his films; these ranging from the adaptation of a small cine camera for natural-color motion pictures to console editing cabinets constructed of inlaid woods. In addition, there were available numerous facilities such as color wheels for projection, splicing devices, lens turrets, etc.

THE PHOTOGRAPHIC PROCESS. No new developing agents of any practical significance appeared during the year, though there were about the usual number of attempts to extol the merits or point out the limitations of certain well-known reducing agents, namely, amidol, glycin, and pyrocatechin. Pyro, elon, and hydro-quinone, however, continued to be favored. Our knowledge of the chemical reactions occurring in a developer is very scant, but it was amplified by several

papers related to the rôle of sulphite in development⁴⁵ and the action of, and substitutes for, alkalis⁴⁶ and bromides.⁴⁷

Interest continued in negative developers for the production of fine-grained images.⁴⁸ This no doubt was stimulated by (1) the need for making duplicate negatives from valuable original motion-picture negatives, (2) the requirements of fine-grained emulsions for the reversal process, and (3) the necessity of a freedom from grain coarseness in sound-film records. Conditions for successful handling of film under tropical⁴⁹ as well as frigid⁵⁰ conditions have been described. A sensitometric study was made of the reversal process.⁵¹ Motion photo-micrographs made of the progress of development of individual grains reveal that development (with elon) starts from points on the grains.⁵² During progress of development the entire grain vibrates and minute tentacles are thrown out from its surface.

The chemistry of fixation was studied and it was stated that only after the bath had been used until a critical concentration of silver is present does the difficultly soluble silver-hypo complex form.⁵³ An apparatus for economical and rapid recovery of silver from spent fixing baths was described.⁵⁴

Of great interest relative to the preservation of photographic materials was the publication of a report on that subject by an international committee.⁵⁵ Recommendations were given for the storage of valuable prints and negatives including lengths of cine film. The changes in swelling undergone by gelatin during the processing of film were investigated.⁵⁶ Practical data were published relative to the handling of all photographic solutions commonly used in photography.⁵⁷

A new method of sulphur toning employed a dichromate-chloride bleach instead of the more common ferricyanide-bromide solution previous to sulphiding.⁵⁸ A novel dye-toning method utilized a single solution containing both mordant and dye, thus halving the work previously required.⁵⁹

PHOTO-THEORY. The Progress and the Hurter and Driffield medals of the Royal Photographic Society were awarded to S. E. Sheppard, of the Kodak Research Laboratories, for his researches relative to the nature of the latent image and the cause of sensitivity. The latent image is the invisible image which forms when a photographic film or plate is exposed in a camera. In his paper of acceptance, Sheppard reviewed the progress made toward solving this ever-mysterious problem.⁶⁰ Since his announcement in 1925 of the existence of silver sulphide specks of amicroscopical * dimensions formed on the silver halide grains from the decomposition of a trace of a sulphur compound in photographic gelatin, chemists and physicists have been busy devising ways to investigate this problem. The balance of evidence indicates that infinitesimal quantities of silver, smaller than the sulphide specks, are also present. When exposed to light a photo-chemical reduction of silver halide occurs, the size of the silver nuclei is increased, perhaps as a result of an internal photo-electric or photo-conduction effect as suggested independently by two investigators, Toy and Trivelli, until centres large enough to induce developability are formed. The latent image probably consists of such development centres composed chiefly of colloidal silver.

F. C. Toy⁶¹ had more recent evidence indicating that the primary stage of latent image for-

mation is probably identical with the mechanism of the photo-conductivity effect, consisting in the liberation of an electron from the halide iron. This was considered a promising line of investigation. Sheppard and Vanslow⁶⁰ corroborated this observation by demonstrating that electrons and bromine are released together by light acting on silver bromide; this was also in agreement with previous research by J. Eggert.

Another interesting phase of this intricate problem was the effort being made to measure quantitatively the free silver present in unexposed photographic plates, and to relate these data to the light sensitivity. Workers at the U. S. Bureau of Standards also made partially successful attempts to introduce colloidal particles into the emulsion to test the possibility that these may be absorbed by the grain and function as sensitivity nuclei.⁶²

Recent patents⁶³ on the use of decomposition products of gelatin (other than sulphur compounds, as described by Sheppard) in enhancing sensitivity had both theoretical and practical significance.

The treatment of photographic plates with various oxidizing and reducing agents yielded considerable useful data. Two papers on the effect of temperature on the latent image also were published.^{61,64} Bleaching of the latent image by exposing it to red light was shown to be produced also in certain cases with light of other wave lengths.^{61,65}

BIBLIOGRAPHY. General reviews of photographic progress are published annually by the Society of Chemical Industry (British) and the American Photographic Publishing Company in their year book called *The American Annual of Photography*. A review of progress in the motion-picture industry is published semi-annually in the *Transactions of the Society of Motion-Picture Engineers*. The more notable photographic books published during 1928 include: *Motion Picture Projection*, by J. R. Cameron (Manhattan Beach, N. Y.); *Der sprechende Film*, by F. von Mihalý, (Berlin); *Amateur Movie Craft*, by J. R. Cameron (Manhattan Beach, N. Y.); *Amateur Movie Making*, by H. C. McKay (New York); *Color Photography*, by Owen Wheeler (London); *La Sensitometrie Photographique et ses Applications*, by G. Moreau (Paris); *Chemical Reactions of the Latent Image*, by E. R. Bullock (New York); *Photography as a Business*, by A. G. Willis (London); *Aërial Photography*, by C. Winchester and F. L. Willis (London); *Motion Picture Photography*, by C. L. Gregory (2d ed., New York); *Données Numériques de Photographie*, by W. Clark (New York).

PHOTOSYNTHESIS. See BOTANY.

PHYSICAL CHEMISTRY. See CHEMISTRY.

PHYSICS. Physics in 1928 showed important developments and discoveries. Electrons were found to behave as waves. Relativity was confirmed by crucial tests. Modified radiation had been induced in solids, liquids, and gases of wave length altered from that of the incident ray. Five million volts were produced for atomic research. Cosmic rays had been measured and their origin found in the probable transmutation of mass into energy. A super-hard glass-cutting alloy was developed by physical research. Metal films one atom thick were used in photo-electric cells for maximum sensitivity. Televox opened the London Electrical Show with a brief address. The talking film had arrived in the theatres and television was regularly broadcast. An automatic self-recording color-analyzer had been devised with automatic computing mechanism. The

electric ultra-micrometer was at work in industrial research and in the dimensional control of products.

An event of the year in physics—a model of its kind—was the meeting of the Optical Society of America with an optical exhibition. The exhibit contained rare historical instruments and books and the programme was full of interesting papers. The climax of the meeting was Michelson's announcement of the negative result of his recent series of experiments for detecting the ether drift. Even with highly sensitive apparatus, the results showed no displacement as large as 2 per cent of that expected if, as suggested, the solar system moves through space 300 km per second. The result is profoundly significant for the tenability of the relativity theory. Michelson announced that while he accepted Einstein's relativity, he still believes the existence of the ether is necessary for light-wave phenomena.

During the year Picard and Stabel's experiments to detect ether drift also failed to show any relative motion of earth and the ether.

St. John believes the evidence was conclusive that Einstein's predicted shift of red wave lengths in the sun's radiation was a fact. For a 3800-angstrom wave the shift is 0.008; and for a 6600-angstrom wave, it is .014 angstrom. For iron rays from the centre of the sun's disk, above the photosphere, the mean shift is 0.009 observed while 0.0091 angstrom is the computed Einstein red shift. He allows for the magnitudes of other factors affecting the apparent wave length.

Einstein's predicted deflection of light by the gravitational field of the sun again was quantitatively confirmed by completed measurements of the apparent positions of the stars photographed during the 1926 total eclipse of the sun. Chazy, in his *Le Theorie de la Relativite et la Mechanique*, issued during the year, gives the evidence for accepting 42.9 seconds per century as the perihelion advance of Mercury, and 1.74 angular seconds for the deviation of light passing the sun at grazing incidence, both quantitatively predicted by Einstein.

Adams found that one remote nebula showed an apparent radial recession of 2500 miles per second, nearly double any hitherto measured speed. The "crumpling of space"—as deduced from general relativity—is the possible cause assigned by Adams for this "spurious velocity of recession." Shapley reported a proportionate effect on nearer galaxies at 10,000,000 light years, about a tenth of the distance of the nebula reported on by Adams. Relativity thus seems to have additional confirmation in phenomena unknown until recent years.

The atom retained its central position in research interest. As expected, the mathematical approaches to atomic structure were merging, and both experiment and theory supported the Bohr-Sommerfeld picture to which the spinning electron has made such a fruitful addition.

Gaviola in an experimental test of Schrödinger's theory proved that the ratios of the intensity of the lines in emission do not depend on the populations of the lower atomic levels in contradiction with the interpretation of Schrödinger's theory.

The Ferner-Davison experiments on the diffraction of electrons showed that an electron possesses, or is composed of, a wave system.

G. P. Thomson announced to the Royal Society the results of his study of "the waves of an elec-

tron." Generalizing de Broglie's theory that corpuscles are accompanied by waves, he concluded that electrons should have a wave system. Thomson's experiments actually show such waves produce diffraction rings on passing through a gold film. Motions of pure point-charge electrons would not produce such waves. The electron behaves like a group of waves whose velocities and wave lengths depend on the speed and mass. For electrons falling through 25,000 volts, he computed the electron wave length at 0.75×10^{-9} cm, about that of hard X-rays. He obtained, therefore, Laue crystal lattice patterns from electrons sent through films of aluminum, gold, and platinum. Thomson confirmed his results by showing that the rings conformed to known crystal structure, that the wave length is inversely as the momentum, and that the known spacing of atoms in the crystal permit computing the ring size.

The electron waves and light waves differ even when the wave length is the same. He quotes a brilliant guess of Newton as being close to the true explanation and he regards the electron as the reality and waves as being related to it.

Davissan and Germer's experimental attempt to polarize electron waves by reflection gave negative results.

Honda held that ferromagnetism was caused by high speed electronic revolutions in the nucleus of the atom. Radioactivity shows that such intra-nuclear electrons exist, revolving with nearly the speed of light. His computed values for the magnetic moment of the iron atom 2×10^{-20} , is close to the observed value. He states that the observed facts of ferro-, para-, and dia-magnetism follow from his theory.

Herzfinkel and Wertenstein attempted without success to accelerate the rate of radioactivity transformation. Braddick and Cave estimated that a gram of radium emits 3.7×10^{10} alpha particles per second—a higher value than that previously accepted. Experiments at the Reichsanstalt show that under bombardment one aluminum atom will disintegrate for each million alpha particles passing and one boron atom for each hundred thousand.

Using constants already otherwise known and more accurate values of the alpha particle energies, Enskog not only computes the nuclear proton structure but packing effects of the right magnitudes are obtained.

The continuous spectrum of the zodiacal light was photographed by Ramdas and showed prominently the 4227 Å absorption line of calcium. He obtained no record beyond 5000 Å, suggesting that the scattering is from matter in atomic or molecular state, and believes that the new effect of modified scattering may account for the apparently weak polarization and special character of zodiacal light.

In General Electric researches, "artificial lightning" was produced at a tension of 3,500,000 volts. The use of the cathode-ray high-speed camera permits the recording of lightning flashes, the surges of which find a maximum in ten-millionths of a second. Boys shows that a lightning discharge may start from ground and cloud at the same instant, meeting in mid-air. Breit and Tuve, using a Tesla oscillator in oil under high pressure, have produced 5,200,000 volts for use in research on the atomic nucleus and high-frequency radiation in the gamma-ray and hard X-ray range.

Crile before the National Academy of Sciences gave his experimental results on excitation, exhaustion, and death in terms of physical constants, showing that when the cell potential difference (between nucleus and cytoplasm) becomes zero, death ensues. This is an extension of his remarkable work in support of his bipolar theory of living processes; which applies as well to the potential difference between the bodily organs as to the positive cell nucleus and the negative cell cytoplasm.

A notable discovery of the year observed by Landsberg and Mandelstam and independently by Raman, is that if a monochromatic ray of light impinges on a substance it gives rise (in many cases), viewed transversely, to polarized wave lengths not in the incident beam but often spaced symmetrically on both sides of the spectral line of the incident beam. Many experimenters have studied the effect in quartz, water, benzene, ether, and other substances. Raman reported that the modified spectrum of monochromatic light diffused by fluids is a powerful and precise method for exploring molecular spectra in the infra-red, especially in the deep infra-red not hitherto accessible to spectral studies. For example, the mercury line 4358 gives in carbon tetrachloride three new frequencies corresponding to three computed (but hitherto unknown) infra-red lines in the carbon tetrachloride spectrum.

It appears that Landsberg and Mandelstam had detected changes in wave length when light is scattered by some transparent media, anticipating the first note by Raman on the subject. German workers reported that the characteristic basic vibration of the C-H group at 3.3 microns are found superposed on the incident light by all compounds tested. Not all the infra-red vibrations give rise to "modified scattering" lines, although all such lines from organic liquids can be referred to known infra-red vibrations. Venkateswaren gives results on the "modified scattering" effect which show that the transformation of monochromatic rays into general or white radiation is caused by the special state of molecular aggregation giving high viscosity. Morton adds that a wide glycerin band suggests that the broadening out of the modified lines to bands is caused by the OH group.

Typical of how band spectra disclose molecular structure is the analysis of the formaldehyde spectrum using the absorption bands in the ultraviolet. Henri and Schou thus find that the formaldehyde molecule is a Y, carbon at the centre, oxygen below, and the two hydrogen at the upper branches. The hydrogen and carbon monoxide furnish two sets of vibrational frequencies. The success of atomic physics in explaining obscure phenomena is well known. Milne states that ionized calcium atoms absorb strongly the powerful H and K radiation of the sun and are thus repelled at great speed into space. At low levels, however, atoms adjust themselves to levels at which radiation pressure and gravitational pull balance. Heavy calcium atoms are thus supported in deep layers. Russell points out that radiation from these intensely hot clouds (faculæ) drives the material into cooler regions (spots) giving the effect of suction or attraction. Calculations give 50 miles per second as the combined result thus attainable.

A new use was found for the polar regions of the earth by Russell who suggested that short

wave stellar spectra extending to 2100 angstroms could be obtained in the polar regions owing to the absence of ozone which strongly absorbs the ultraviolet. At 2100 angstroms, the absorption of oxygen begins. Experiments at Trömsö were planned to study the research possibilities of the polar regions.

The use of physics in biological research was notably increasing. The effect of continuous radiation on plants at the Boyce-Thompson Institute illustrates the astonishing results obtained. Arthur reports that rays a quarter-micron wave length produce lethal effects on tomato leaves in thirty seconds, while slightly longer waves produce no injury. Buckwheat grew steadily with continuous radiation. Applied physics is productive of new orders of phenomena, often unpredicted and of great significance. A great acceleration of growth and development of plants was reported by Goodspeed as a result of special kinds of X-ray treatment. The Smithsonian Institution in cooperation with the Fixed Nitrogen Laboratory initiated a research on the relation of radiation to plant growth and on the measurement of ultraviolet.

The use of X-rays in experimental evolution research reported last year has been extended to corn and barley. Professor Muller's X-ray spraying of fruit flies produced great numbers of gene mutations, speeding up to 150 times the normal rate the process of variation or production of new types of individuals by translocation of the chromosomes. British experiments on the ultraviolet irradiation of stock to counteract the dearth of sunshine showed that as compared with control stock the market value was increased fourteen times the cost of irradiation.

Slack developed a beta-ray tube as a general laboratory tool for the study of effects of such rays on living and mineral matter. A strong thin bubble permits electrons to emerge through a thickness of about one five-thousandths of an inch of glass. Among the first observations were interesting changes in color hitherto unknown in uncolored alkali metal salts irradiated with beta rays. A new resource was thus made available for physical laboratory research.

Boss attributed the measured variation in the day to the swelling and shrinking of the earth and correlated the change with variations in the rotation rate and earthquake frequency. *Nature* reports that tidal friction has increased the terrestrial day 0.0025 second per century during the past three centuries. The tidal drag on the earth is computed to be equal to a billion and a half horse power. A rhythmic increase and decrease about the mean value also occur, not, however, exceeding 0.0036 second deviation from the mean.

Wenner devised a precision seismometer with both optical and magnetic amplification. The magnification is about 1000. The minutes and seconds intervals being marked off automatically on the seismograph, the graphs are self-defining. Fine periodic rhythmic traces at all times are attributed to the beats of the ocean surf many miles away. Earthquake autographs of great smoothness are being recorded by this highly precise and sensitive seismometer.

Störmer reports radio echoes as high as 15 seconds after the signal, attributing them to reflections from streams of electrons from the sun at about 200 earth radii from the earth. Chapman states that this would require an electron density about 10^5 per cubic centimeter. Positive

ions must be present and the stream density would be about that of the solar chromosphere. If this is confirmed, the cause of such echoes being extra-terrestrial, it means that man has produced perceptible effects in space for the first time, namely, at distances of 800,000 miles. However, other investigators attribute the long period echoes to the gradient of electron density in the upper air according to which any time-interval between signal and echo may be expected to occur. Discussion is keen as to the true cause of these echoes. Stetson announced that the conditions at sun-spot maximum (late 1929) would mar radio reception.

Hurlburt shows that the ultraviolet ionizing of the upper air forms the Kenelly-Heaviside layer which makes possible long-distance radio. Pettit forecasts enhanced ultraviolet during the coming sun-spot maximum with accompanying tendency to sunburn.

Quartz for radio-frequency control develops interesting facts reported by Herber. For example, 0.141 inch thickness corresponds to 550 kilocycles. A 1000-kc crystal changes 100 cycles if only 9-millionths inch is removed, or may vary by 80 cycles per degree centigrade change in temperature. Hence, precise dimensioning and temperature constancy are necessary to control radio to frequency constancy of one or two parts in 100,000 as is now being accomplished in daily practice at the U. S. Bureau of Standards. In the Bell television system, Marrison stated frequencies were actually maintained in the most exacting work to a constancy of one part in ten million, requiring that the quartz oscillator be maintained at a temperature standard and constant to within 0.01 degree centigrade.

Millikan and Cameron's observations in the Andes showed that cosmic rays were independent of geographical position. At sea-level, thunder storms did not affect the cosmic rays, namely, the equivalent 1.4 ions per cubic centimeter per second. No effect was shown by the milky way compared with the plane perpendicular to it. Using Compton's formula for the wave length gives from 0.525 to 0.32 milliangstroms.

Rutherford pointed out that X-rays from radium have a quantum equivalent of 4,000,000 electron volts; that the total quantum from the hydrogen-helium transformation is 27,000,000 electron volts, and the proton itself represents an internal energy equivalent to 940,000,000 electron volts. He adds that possibly observed cosmic ray effects are explicable by high energy electrons entering our atmosphere quite as well as by mass-energy transformations. Millikan and Cameron hold that they indicate the synthesis or creation of common elements out of protons and electrons in interstellar space.

The absorption coefficient of the most penetrating rays deduced by Millikan and Cameron agrees with the Klein-Nishina relativistic form of wave mechanics for a quantum of 940,000,000-electron volts energy—the energy disseminated from the transformation of the internal energy of the proton into radiation. A billion-electron-volt transformation would account for the highest frequency ultrapenetrating rays observed. Skobelzyn, in studying the relative intensities of the gamma rays from radium C, noted trials of very energetic beta particles, caused, he believes, by ultrapenetrating radiation in our atmosphere.

Millikan and Cameron, after new observations and computations, using Einstein's mass-energy

equation, Dirac's absorption equation, and Aston's positive-ray measurements, conclude that cosmic rays are the result of the creation "in a single step" of such elements as helium (from hydrogen), oxygen (from hydrogen), silicon (from hydrogen). The three discrete groups of cosmic ray frequencies correlate with the three transformations as indicated by the close agreement of absorption coefficient computed and observed, respectively as follows: 0.30 and 0.35; 0.075 and 0.080; and 0.043 and .040. That the synthesis of iron is a fourth possibility is foreshadowed but not confirmed by preliminary results already obtained.

Appropos of a recent assertion by Nernst that astro-physics depends more than any other science upon daring hypothesis, may be cited Haldane's statement "if the present universe melts away into radiation, another equally improbable will develop in a period of years equal to ten with exponent 10^{100} " based on Hubble's estimate of 10^{81} as the lower limit of the number of existing atoms, and upon Jean's speculations on the exceeding improbability of a universe with as little entropy as our own, namely, $-10^{92.6}$ a probability of only 10 with exponent. Admittedly speculative, such serious discussions show a new freedom in physics which has come chiefly since the relativity theory was first announced.

The measured cooling rate suggests that the moon's surface is largely pumice or material with similar radiational properties. Pettit and Nicholson's measurements of the moon's temperature show that it attains 265 degrees Fahrenheit over 1600 miles square in sunlight and -196 degrees on the dark side. The high temperature agrees within error of observation with the value deduced by Coblentz from his own radiometric measurements some years ago.

Johnsrud measured films of rubidium as thin as one atom, finding that the maximum photoelectric effect is produced with a layer one-atom thick. In a General Electric research a "glass-cutting" alloy was developed called "carbolly" capable of machining glass or hard porcelain and showing twice the hardness of tool steel. Elman described the development of permivar showing a hysteresis loop constricted at the origin of coordinates, passing through the zero point. Muller's transparent steel films a few millionths of a millimeter thick had proven of such importance that films of other metals were being produced. A disk held between two rings ripples like a surface of water when blown upon. The slight mass permits tonal reproduction without distortion. Keyes discovered how to electro-deposit aluminum and Sheppard reported that the rubber particles used in the electro-deposition of rubber have a negative contact potential of 0.035 volts and a mobility of 2.7 microns per second. Rubber fillers may be mixed with the latex as colloidal suspensions and deposited with the rubber. Thick deposits may be built up since they are permeable.

The production of high-frequency or ultrasonic waves awakened new interest recently through the work of Wentz on the electro-static transmitter, of Hewlitt and his electro-dynamic oscillator, Hartmann and his air-jet oscillator, and Woods and Loomis with the quartz oscillator. Interesting effects of supersonants are reported, some of them attributed to heating effects. A vibrating glass thread held between the fingers causes burns. Small organisms such as

paramacia or even fish and frogs are killed, benzol is atomized into a fine mist, emulsions otherwise impossible may be produced, and dust figures of great delicacy and beauty are formed. Already research work is planned for the practical utilization of short-wave supersonants.

BIBLIOGRAPHY. The important books of 1928 are too many to be listed. Examples must suffice. Allen's *The Quantum and Its Interpretation* and Fowler's *Wave Mechanics and the Quantum Theory* are typical of quantum literature of great excellence. Joffe's *Physics of the Crystal*, Sosman's *Properties of Silica*, and Bragg's *Introduction to Crystal Analysis* are examples of the rich literature on crystal structure. Grotrian's *Graphische Darstellung der Spektren von Atomen und Ionen mit ein, zwei, und drei Valenzelektronen* was a great event in spectroscopy where the graphic method has been so illuminating. J. J. Thomson's *Beyond the Electron* opens up the next stage in the physics of the structure of matter and radiation. Leggett's three volumes on radiology: *Theory and Practice*, *Electrical Theory*, and *X-ray Apparatus and Technology* were real additions to the literature. Of more general physical literature may be cited Richtmyer's *Introduction to Modern Physics*, Eddington's forthcoming *The Nature of the Physical World*, Fitch's *Fundamentals of Physics*, and Searle's *General Properties of Matter*.

The Bureau of Standards *Journal of Research* was started in July, 1928, and completed its first volume in December. It is the outlet for the bureau's results in scientific and technical research. The progress of physics as shown in the journals may be followed in the rapidly increasing abstract literature *Science Abstracts*, *Physics Section*, *Chemical Abstracts*, and the *Technical Index*, all of which happily are more thoroughly than ever reviewing the research literature of the world.

The above summary is necessarily a mere bird's-eye survey of physical research during 1928, which would require a volume to describe. Time alone will reveal whether in those described or in those here passed over for lack of space lie potential the epoch-making discoveries which would enter into the physics of tomorrow. The trend of current physics was toward unlimited degrees of freedom for speculative physics as shown in relativity literature, in the development of precision measurements in all fields, and the application of automatic methods both for measurement and computation—all gratifying tendencies.

PINKHAM, THE RIGHT REV. WILLIAM CYPRIAN. Canadian prelate, died at Calgary, Alta., July 18. He was born at St. John's, N. F., in 1844. He was the oldest consecrated bishop in the Anglican communion in the world. Bishop Pinkham was educated at St. Augustine's Missionary College, Canterbury, England, and was admitted to the priesthood in 1869. He went to the then comparatively unknown country of Manitoba, as incumbent of St. James's, in 1868, and was one of the real pioneers of western Canada. He remained at St. James's until 1882, and in the meantime and until 1883, served as superintendent of education for the Protestant

public schools of Manitoba. From 1882 to 1887 he was archdeacon of Manitoba and canon of St. John's Cathedral, Winnipeg; in 1883-84, acting rector of All Saints' Church, Winnipeg; in 1882-87 secretary of synod; 1887-93, Bishop of Saskatchewan, and Bishop of Calgary from 1888 to 1926, when he retired. For a few months in 1913-14 he was also Bishop of Edmonton. The Archbishop of Canterbury conferred on him the degree of B.D. in 1880 and he was also an Honorary D.C.L. of Trinity University, Toronto, Ont., and of the University of California, and an honorary D.D. of the University of Manitoba.

PITAVAI, THE RIGHT REV. JOHN BAPTISTE. American Roman Catholic prelate, died at Denver, Colo., May 23. He was born in France, Feb. 10, 1858. He went to the United States in 1881 and was assigned to Colorado. In 1909 he was ordained Archbishop of Santa Fe, N. M., and he remained at the head of the archdiocese until 1918, when he was compelled by ill health to resign. From 1920 until his death he was chaplain of St. Anthony's Church, Denver, Colo. Archbishop Pitaval was a leader in the work of his denomination in the southwestern part of the United States for almost a half-century.

PITTSBURGH. See MUNICIPAL GOVERNMENT.

PITTSBURGH, UNIVERSITY OF. A non-sectarian institution of higher education for men and women, at Pittsburgh, Pa., founded in 1787. The total autumn enrollment for 1928 was 9960 (exclusive of extension and the 1928 summer session) distributed as follows: College, 2033; engineering, 384; mines, 94; business administration, 652; education, 1034; graduate, 905; medicine, 261; law, 279; pharmacy, 437; dentistry, 340; retail training, 22; downtown division, 2620; Johnstown centre, 262; Erie centre, 367; Uniontown centre, 270. The extension division had an enrollment of 1087, and the 1928 summer session, 2798. There were 851 faculty members, including 154 new appointments, as follows: business administration, 11; college, 78; education, 12; engineering, 8; mines, 2; dentistry, 1; law, 3; pharmacy, 5; medicine, 29; military department, 2; retail training, 3. The library contained more than 115,000 volumes. The productive endowment amounted to \$1,708,402, and the year's expenditures to \$3,022,768. Income from the Pennsylvania State Legislature amounted to \$414,799. Developments during 1927-28 included the establishment of the Uniontown Centre, at Uniontown, Pa., under the direction of the University Extension Division, and progress on the construction of the Cathedral of Learning. The following bequests were received: \$750,000 for the Falk clinic; \$50,000 for the establishment of a scholarship, bequeathed by Elbert H. Gary; \$5,000 for a scholarship, from Z. Bailey Ogden; \$9,000 for a trust fund, given by Solomon Rosenbloom; \$210,000 for a building by Gardner Steel; and \$90,000 for general endowment, by David L. Gillespie. Chancellor, John G. Bowman, LL.D.

PLACE, IRA ADELBERT. American railroad attorney, died at New York, Jan. 24. He was born at New York, May 8, 1854, and after studying at Alfred Academy, Alfred, N. Y., was graduated from Cornell University in 1881. He went to Buffalo, N. Y., and studied law, and was admitted to the bar in 1883. In the same year he entered the offices of the general counsel of the New York, West Shore & Buffalo R. R., and when the company operating that road

was reorganized three years later he entered the law department of the New York Central & Hudson River R. R., now a part of the New York Central Lines. In 1902 Mr. Place became general attorney for the New York Central & Hudson River R. R., and in 1905 he was appointed general counsel. On Dec. 5, 1906, he was advanced to vice president in charge of law, the land and tax department, and the claim department. During Federal control, 1919-20, he served as general solicitor, and then became vice president of the New York Central Lines. He was appointed senior law vice president in June, 1927. He was highly regarded as an outstanding expert in railroad law. He took a leading part in the development of Park Avenue, New York, from a shantytown and neglected district to one of the finest thoroughfares in the world. He was honored by Alfred University with the degree of LL.D., in 1924.

PLATINUM. During 1928 there was apparently an adequate supply of platinum available with the world production running in excess of consumption. The price of platinum, which opened the year at \$72 an ounce, advanced until a maximum of \$90 an ounce was recorded on January 16, after which the price declined steadily until at the end of the year it was \$74. Colombia continued the expansion of its facilities and various deposits were being worked involving dredging, with three dredges in operation by South American Gold and Platinum Co. In 1926 the production of crude platinum was approximately 46,000 ounces and the output increased rather than declined in 1927 and 1928. The production in Russia continued on about the same basis. In 1926 the output was estimated at 92,700 ounces; while for 1927 and 1928 a production somewhat in excess of that figure was indicated. The principal use of platinum in normal times is in jewelry and in 1927 it was estimated that about 70 per cent of the platinum and radium consumed in the United States was purchased by jewelers. In Canada the production of platinum in 1926 was stated at 9471 ounces, valued at \$919,347, obtained by the refining of nickel and copper ores in the Sudbury District of Ontario, and crude platinum obtained from placers amounting to 50 ounces. In the United States in 1927, crude platinum produced was 20 troy ounces from Alaska, 127 ounces from California, and 6 ounces from Oregon, or a total of 153 ounces.

The imports of platinum into the United States in the form of grains, nuggets, sponge, or scrap, during 1928, amounted to 98,349 troy ounces valued at \$5,294,668, as compared with 90,491 ounces valued at \$7,480,869 in 1927. Platinum ingots, bars, and sheets, or plates, amounting to 29,362 ounces valued at \$2,348,840, were imported in 1928, as compared with 38,053 ounces valued at \$3,707,062 which were imported in 1927. There were also sent to the United States in 1928, 686 ounces of platinum ores with platinum contents valued at \$49,094.

PLAYGROUND AND RECREATION ASSOCIATION OF AMERICA. An association organized in 1906 by Theodore Roosevelt, Jacob A. Riis, Luther Halsey Gulick, and others, for the purpose of binding together in a national body the efforts growing up in various parts of the country to provide safe and adequate areas where children might play under experienced leadership. A staff of field workers is maintained to assist cities in organizing year-round recreation programmes for children, adults, and the community as a whole, to strengthen existing programmes, and to help secure state legislation for facilitating the development of municipal recreation. Other phases include: An employment service for recreation workers and a correspondence and consultation bureau which answers letters of inquiry and holds personal conferences on local work. The community drama service of the association supplies practical suggestions and literature to amateur dramatic groups and prepares programmes for holiday and special day celebrations. The community music service assists in organizing music groups and in training volunteers and provides an exchange for community music information. The association also maintains a Bureau which gives assistance to Negro groups in securing recreation opportunities. A new development during the past year was the assignment, in coöperation with the U. S. Department of Agriculture, of a full-time worker to help in the training of rural leaders for recreation.

A national training school was established in 1926 to provide graduate courses in professional recreation training. The national physical education service of the association is active in sponsoring physical education legislation. The association publishes *The Playground*, a monthly magazine, and maintains a weekly bulletin service. Among the books published in 1928 were, *A Manual of Municipal and County Parks, Play Areas—Their Design and Equipment*, and a game book, *Recreational Games and Programs*. The fifteenth annual recreation congress of the association was held at Atlantic City, New Jersey, in October, 1928. The officers for the year were: President, Joseph Lee; treasurer, Gustavus T. Kirby; secretary, Howard S. Braucher. Headquarters are at 315 Fourth Avenue, New York.

PNEUMONIA, nū-mō'nī-ā. The Felton polyvalent serum was under consideration during the year, although it was by no means new. It was first given to the medical profession over four years previously and was at the time regarded as a promising one. In the meantime, however, it seems to have been ignored and health officers have stressed the need of specific sera for pneumonia due to the different micro-organisms, some of which are much more virulent naturally than others. Time is lost in making a bacteriological diagnosis and perhaps also in obtaining the particular serum indicated. A polyvalent serum should spare the patient this delay. Dr. Cecil, of the pneumonia clinic at Bellevue Hospital, New York, who had made trial of the serum originally developed by Dr. L. D. Felton, of Harvard University, announced that excellent results were obtained therewith. It is true that, although nominally polyvalent, it gave the best results in Types I and II, while those obtained in the deadly Type III were less favorable. But even if the Felton serum should not prove its superiority to the specific preparations when

taken collectively, it is still true that it can be applied much more promptly, so that the net advantage to the patient is considerable and therefore the serum in question may be regarded for the present as marking an advance.

THE QUININE TREATMENT. Quinine and its derivatives have for many years been put forward as of actual value in lobar pneumonia, and it is certainly unusual for a remedy to maintain a favorable reputation in such a treacherous malady for more than sixty years. The earliest reports in the United States were discounted by the fact that they proceeded from the malaria-ridden parts of the country, but new claims have constantly cropped out, especially since the introduction of synthetic derivatives of the drug. In 1905 the hypodermic use of quinine and its derivatives began and during the present year several eminent clinicians have advocated this method. Dr. John, of Mülheim, has used this resource in several hundred cases. The serum treatment he regards as indicated only in very recent cases, while quinine injections may favorably influence advanced cases and also seem to abort early cases in some instances. In the more advanced cases the pulse improves, the mind clears, and the patient loses his dusky look; but quinine appears to be of value only in pneumococcus cases, so that a bacteriological diagnosis is necessary. The treatment is safe and in many thousand injections Dr. John has seen but three accidents, only one of which seemed serious. He asserts that the action of quinine in the suitable case is so specific that it may not be necessary to make use of heart stimulants.

DIATHERMY TREATMENT. This method of treating pneumonia had been tested for over 6 years by Dr. H. E. Stewart of the United States Marine Hospital Service, reporting his experience since 1922. In the *Archives of Physical Therapy* for October, 1928, he gives his results to date along with those of others throughout the world who have given his method a trial. Apparently the latter has been used chiefly in desperate cases and in localities where the pneumonia death rate is high. The results have been so striking that the writer has some diffidence in making them public, knowing that the history of pneumonia treatment is full of fallacies. His own mortality figure is about 12 per cent and a survey of all the published reports reveals that when the treatment is begun the first or second day, the mortality is almost nil. Thus a remedy put forth at first only for the relief of pain and distress seems destined to compete with and perhaps surpass the best modern management. Naturally, such treatment can be carried out only under certain conditions not available for the great mass of the people.

POETRY. See LITERATURE, ENGLISH AND AMERICAN; FRENCH LITERATURE; GERMAN LITERATURE; ITALIAN LITERATURE; SCANDINAVIAN LITERATURE; SPANISH LITERATURE; PHILOLOGY, MODERN.

POHLIG, KARL. A German orchestra conductor, died in Brunswick, in July. He was born in Teplitz, Feb. 10, 1864. After completing his musical education under Liszt, he began his career as a concert pianist, making successful tours of Germany, Austria, Russia, Scandinavia, and Italy. In 1895 he became assistant-conductor to Mahler at the Vienna Hofoper, directed the German operas at Covent Garden in 1897-98,

and then was appointed first conductor at the Hoftheater in Koburg. From 1900-1907 he was in Stuttgart as conductor at the opera and of the symphony concerts. The next five years he spent in the United States, directing the Philadelphia Symphony Orchestra. Returning to Germany, he settled in Brunswick as conductor at the ducal opera and of the symphony concerts, was made general musical director in 1916 and retired in 1924. He wrote a symphonic poem, *Per Aspera ad Astra*, and several choral works.

POISON GASES. See CHEMISTRY, INDUSTRIAL; MILITARY PROGRESS.

POLAND. A European republic formed as a result of the World War and comprising the territory formerly divided among the three governments, Austria-Hungary, Russia, and Prussia, from the three partitions of Poland in 1772, 1793, and 1795, which were confirmed by the Congress of Vienna in 1815. After the World War (1914-18), Poland, in addition to this original territory known as Congress Poland, acquired Prussian Poland, Polish Galicia, Upper Silesia, and a portion of the Vilna territory. Capital, Warsaw.

AREA AND POPULATION. The total area, according to recent estimates, is 149,958 square miles, and the population, according to the first official census of the Polish Republic in 1921, 27,176,717; estimated in 1927, 29,589,000. The largest cities with their populations at that census were: Warsaw, 936,713; Lodz, 451,974; Lvov, 219,388; Poznan, 184,756; Cracow, 183,706, and Wilno, 128,954. The Polish nationality represents two-thirds of the population and is followed in numerical order by the Ruthenians and Jews.

EDUCATION. Primary instruction is free and compulsory and all other grades of education are free. In 1927 there were 26,775 elementary schools with 69,360 teachers and 3,365,235 pupils; 780 secondary schools with 14,733 teachers and 216,552 pupils; 195 colleges for teachers with 1931 teachers and 34,437 pupils; and 850 technical and professional schools with 110,000 pupils. The universities and institutions of university rank numbered 16 with 950 professors and 36,590 students.

PRODUCTION, ETC. Agriculture and stock raising are the two principal occupations of the country engaging about 65 per cent of the people. In 1926 there were in Poland 45,239,000 acres of arable land, or 47 per cent of the total area, 15,732,000 acres of permanent meadow and pasture, and 22,392,000 acres of woods and forests. On Jan. 1, 1928, there were 8,571,000 cattle, 6,397,000 swine, 1,917,000 sheep, and 4,128,000 horses. With regard to agriculture, 1927 was one of the best years of the post-war period. The combined output of wheat, rye, barley, and oats, the most important crops apart from potatoes, exceeded that of 1926 and the average for the preceding five-year period by 11 and 12 per cent, respectively. The higher output was owing to favorable weather, and, to a considerable degree, also to greater use of fertilizers and better tillage, as there was practically no increase of the sown area over the preceding year. The area under cultivation in all crops has almost reached the pre-war maximum, making further expansion possible only by draining the marshes, especially in the eastern part of the country, and by encroaching upon the forests. Intensive farm-

ing and the development of production of more valuable commodities, such as eggs, butter, live animals, meat products, have been fostered lately by agricultural organizations. The following table from the COMMERCE YEAR BOOK for 1928 gives the area and production of the principal crops:

Crop	Area (thousands of acres)	Production (thousands of units—bu., and as indicated)	
		1927	1927
Wheat	2,814	54,229	
Rye	12,081	223,944	
Barley	3,063	75,060	
Oats	6,475	233,551	
Corn	196	4,043	
Potatoes	5,946	1,166,891	
Sugar beets	489	3,620 "	
Linseed	271	3,039	
Flax		148,812 "	

" Unit, metric ton.

" Unit, pound.

Though agriculture is the major industry of Poland, mining and manufactures are of much and growing importance. The number of industrial workers in the principal groups of industry was as follows in December, 1927: Mines, 144,186; metallurgy, 57,569; manufacturing, 518,549. Of the last group the most important were workers in nonmetallic mineral products, 47,404; metals, 87,799; chemicals, 33,432; textiles, 170,566; wood, 45,456; foodstuffs, 75,586. Industrial production for 1927 included: Coal, 38,016,000 metric tons; crude petroleum, 5,309,000 barrels; petroleum products, 618,912 metric tons; natural gas, 454,139,000 cubic meters; pig iron, 618,000 metric tons; steel, 1,248,000 metric tons; zinc, 149,856 metric tons; lead, 27,600 metric tons; potash, 276,000 metric tons; salt, 378,000 metric tons; and refined sugar, 537,268 metric tons. The sagging tendency in the output of crude oil continued in 1927, with a decline of about 10 per cent in gross production, as a result of the diminished yield of some of the old wells in the principal oil fields. There was greater activity in drilling operations during 1927, the number of new wells completed having increased to 167, against 112 in the preceding year. The Government is actively pushing for the discovery of new oil territory.

COMMERCE. Foreign trade operations for 1927 closed with an adverse balance of 221,151,000 gold francs—imports at 1,680,530,000 and exports at 1,459,000 gold francs. These figures compare with 896,232,000 gold francs of imports and 1,306,040,000 gold francs of exports in 1926 and a resultant favorable balance of 409,808,000 gold francs.

Preliminary trade statistics for 1928 indicated an adverse balance greater than that of 1927.

FINANCE. State revenues and expenditures for 1927-28 reached a record of \$310,555,000 and \$280,927,000, respectively, leaving a surplus near \$30,000,000. Receipts and disbursements exceeded by 39 per cent and 26 per cent, respectively, the revised budgetary estimates for the year. The marked improvement was due to a general increase in taxes and revenues from State enterprise and monopolies, as a result of enhanced buying capacity of the people. As a part of the plan of currency stabilization, it had been proposed to create additional revenues

of about 300,000,000 zlotys, but the growing receipts from existing sources made these revenues unnecessary. The budget for 1928-29 provided for revenues of \$283,384,000 and expenditures of \$278,073,000. The project of the budget for 1929-30 submitted by the Minister of Finance to the Diet, carried a total of 2,809,900,000 zlotys of anticipated revenues, and 2,802,000,000 zlotys of proposed expenditures, representing increases of 154,000,000 and 326,000,000 zlotys, respectively, over the budget for 1928-29 as finally passed by the Diet and the Senate on June 20, 1928. The proposed expenditures include about 400,000,000 zlotys of investments for construction and improvements, exclusive of appropriations for investment expenditures by the state railroads, totaling 336,000,000 zlotys for construction of new lines and for rolling stock. The total public debt on Jan. 1, 1928, was \$466,690,000.

PRINCIPAL ITEMS IN POLISH FOREIGN
TRADE, 1926 AND 1927

COMMUNICATIONS. The entire railway system in Poland is owned by the State, with the exception of short narrow-gauge railways connecting Warsaw with the near-by towns and summer resorts. The state, however, was systematically buying these railways from the private owners. The total length of railways in Poland at the end of 1926 was 11,986 miles. No later statistics were available than those given in the YEAR BOOK for 1927.

During 1927, 530 vessels of 423,000 tons entered at the port of Gdynia and 519 of 416,000 tons cleared; at Danzig 6950 vessels of 3,900,000 tons entered and 6942 vessels of 3,933,000 tons cleared. Gdynia had been partially open to traffic since 1927 and was the newest

port on the Baltic. Construction on the port was begun in 1921. The site selected was absolutely virgin in state, so that the expansion of the port might follow its natural course unhampered and in accordance with up-to-date principles of port construction. See PORTS AND HARBORS.

GOVERNMENT. Under the constitution adopted Mar. 17, 1921, executive power is vested in the President, chosen by both houses of the National Assembly for a period of seven years; and legislative power is vested in the National Assembly, consisting of a Senate of 111 members and a Diet (444 members), called the Sejm, both elected by universal suffrage. President in 1928, Ignace Moscicki, elected June 1, 1926. The cabinet was composed as follows: Premier and Minister of War, Joseph Pilsudski; Deputy Prime Minister, Casimir Bartel; Foreign Affairs, August Zaleski; Finance, Gabriel Czechowicz; Justice Alexander Meysztowicz; Interior, Slawoj Skladkowski; Commerce and Industry, Eugene Kwiatkowski; Agriculture, Charles Niezabutowski; Agrarian Reform, Witold Staniewicz; Communications, Vincent Romocki; Labor and Social Affairs, Dr. Jurkiewicz; Public Works, Andrew Moraczewski; Education, Dr. Gustaw Dobureki; Posts and Telegraphs, Bogustaw Miedzicki.

HISTORY. Compared with 1927, the year 1928 was one of comparative quiet for Poland. Of course, the perennial struggle with Lithuania was to the fore from time to time, but the year closed with the question further from settlement than when it began. See LITHUANIA. Elections for the national Parliament were held in March. More than two thousand candidates, representing all shades of political belief, ran for the 454 positions. It was expected, of course, that Marshal Pilsudski would retain a sufficient control over the membership to maintain himself in power. This actually occurred, although when the new Parliament met, the Marshal was compelled to accept the defeat of his own personal candidate for the position of President. The seat was won by a Socialist, although Pilsudski appeared to accept this rebuff in good spirits. During the summer, Pilsudski's smooth path was rather ruffled. In May he was seriously ill and was unable to attend to the business of state, and the opposition party in the Parliament took this occasion to break up his majority bloc. This was accomplished by the disaffection of the conservative elements, who had supported him up to this point. He returned to his desk in the latter part of June and almost immediately prorogued Parliament. He attacked his cabinet for permitting the control of Parliament to escape from their hands, with the result that on June 26 most of his cabinet resigned. Curiously enough, he resigned himself on the following day. M. Bartel became Premier and Pilsudski accepted the position of Minister of War. Of course, most observers believed that Pilsudski's action was merely a sham to cover some future plan he had in mind. When conditions went on as before and no radical changes were brought about, it was quite evident that the "dictator" was still at the helm. Conditions remained in the *status quo* for the remainder of the year. See JEWS.

POLISH LANGUAGE AND LITERATURE. See PHILOLOGY, MODERN.

POLAR RESEARCH. The most significant Arctic expedition of 1928 was the twenty-and-

one-half-hour flight of Captain Sir Hubert Wilkins from Point Barrow, Alaska, to Dead Man's Island, Spitzbergen (Svalbard). Following a previously plotted course just to the north of the Canadian Arctic Archipelago, good visibility enabled him to reduce considerably the extent of unexplored area between North America and the North Pole. During the flight, observations were made on meteorological, ice, and navigation conditions. Wilkins accomplished the three objectives of his expedition; the search for new land—of which none was found; study of the feasibility of establishing a meteorological station in the Far North; and proof of the efficiency of the airplane in high latitudes.

Kings Bay, Spitzbergen, served as the base for the dirigible *Italia* which made three polar flights in May under the command of General Nobile. The first trip, to Franz Josef Land, was curtailed because of fog; the second was over unexplored territory in the vicinity of Northern Land; on the third flight, which reached the North Pole, the *Italia* was wrecked just north of Cape Leigh Smith, Northeast Land. Two weeks later, communication was established between the *Citta Di Milano*, base ship for the expedition, and the occupants of the main gondola which had been torn away from the bag when the airship first crashed. Finnish, French, Italian, Norwegian, Soviet, and Swedish rescue expeditions were organized and on July 12 the Soviet icebreaker *Krassin* reached the marooned men. Previously, Nobile was rescued by the aviator, Chukhnovsky, and Dr. Finn Malmgren lost his life in an attempt to reach land with two Italian companions who were later taken aboard the *Krassin*. Further search failed to reveal other traces of the *Italia* or of the six men who had been carried away with it. In all, eight of the crew were rescued, eight were lost, and Captain Roald Amundsen and five others disappeared while flying to the rescue of the Italians. The scientific results of the expedition are in course of preparation.

The International Society for the Exploration of the Arctic Regions by means of the airship is making plans for extended explorations with the *Graf Zeppelin* under the leadership of Fridtjof Nansen. It is planned to erect one mooring mast in Alaska and another in Russia thus giving the ship a wide cruising radius. The first number of *Arktis*, the official publication of this Society, was issued in 1928.

In the American Arctic, Davis Strait was visited by an expedition from the Danish Hydrographic Office. In the same region, the U. S. Coast Guard cutter, *Marion*, carried out extensive oceanographic and iceberg studies. The Canadian Government steamer, *Beothic*, made its regular inspection visits to points on Baffin Island and Ellesmere Island for the purpose of relieving the Far North stations of the Royal Canadian Mounted Police and of determining the condition of the natives. Major Burwash went north for the purpose of checking the North Magnetic Pole. The Forsild brothers continued their survey of wild life, the conservation of which is vital to the well-being of the natives of the Canadian Arctic Archipelago.

In Greenland, the University of Michigan Expedition under Professor Hobbs completed a year's study of meteorological conditions and their relation to world weather. At Angmassalik, the Rumanian Greenland Expedition under Dr.

Dumbrava spent ten months making observations similar to those of the Hobbs Expedition. The Oxford University Expedition to Greenland continued its biological studies under Dr. Longstaff.

The Norwegian Government established a central institution for the exploration of Svalbard. Plans for all expeditions were to be passed on as to the value of the proposed work and the fitness of the expedition.

In the Siberian Arctic, a number of expeditions under the Soviet Academy of Sciences have pursued studies of the natives and natural resources of the country. Efforts to relieve a colony established in 1926 on Wrangell Island have been unavailing due to the ice conditions.

At the end of 1928, the Byrd Antarctic Expedition, after a successful traverse of Ross Sea, was establishing in the Bay of Whales a base for extended exploration of the Antarctic Continent. The men and equipment of this expedition left the United States in the *City of New York* which sailed from New York on Aug. 25; in the *Eleanor Bolling* which cleared from Hampton Roads the middle of September; and in the whaler, *Larson*, which left San Diego on October 12. The expedition was reunited at Dunedin, New Zealand, whence the *City of New York* became the sole transport. Commander Byrd had before him the largest extent of unexplored land in the world, the possibility of conquering the South Pole by air, and the opportunity of making valuable contributions to our knowledge of the geology, biology, topography, and meteorology of the Continent.

The Antarctic expedition of Captain Sir Hubert Wilkins differs from that of Commander Byrd. Wilkins and three companions shipped their two planes and modest equipment to Montevideo, Uruguay, whence they left for Deception Island, Graham Land, on board a whaler. On December 19, Wilkins made a perilous take-off from Deception Island and flew south through Graham Land. His observations at this time were of greatest importance since they showed that Graham Land is separated from the main mass of the Antarctic Continent by a number of ice-filled depressions. The chief objective of the expedition is a flight from Graham Land for 2000 miles along the unexplored edge of the supposed Antarctic Continent to Ross Sea. The significance of such a flight lies not only in its reconnaissance value but also in the contribution which it may make to our knowledge of world weather. Wilkins feels that as aerial transportation becomes more and more common, meteorological stations must be established at key points, one of which will probably be in the region he plans to traverse.

An interesting work, *The Polar Regions in the Twentieth Century: Their Discovery and Industrial Evolution*, by General A. W. Greely, U.S.A., Ret., for many years a contributor to the *YEAR BOOK*, was published during the year.

POLITICAL AND SOCIAL SCIENCE, AMERICAN ACADEMY OF. A forum for the discussion of social, industrial, political, and economic topics, founded in Philadelphia, Dec. 14, 1889, and incorporated Feb. 14, 1891. Meetings are held throughout the year at which subjects of national and international interest are discussed. The thirty-second annual meeting, which was held May 11 and 12, 1928, considered the general subject: "Some Aspects

of the Present International Situation." Other meetings conducted during the year discussed the following subjects: "Local Taxation," "The Reconstruction of Belgium," and "Freedom of Speech in the United States." *The Annals* is published bimonthly as the official organ of the Academy, each issue being devoted to a study of a particular topic of economic, political, or social importance. In 1928 the following volumes were issued: "Great Inland Water-Way Projects in the United States," "Progress in the Law," "Standards in Industry," "Some Aspects of the Present International Situation," "Stabilization of Commodity Prices," and "The American Negro." The officers in 1928 were: President, Dr. L. S. Rowe; secretary, Dr. J. P. Lichtenberger; treasurer, Charles J. Rhoads; and vice presidents, Dr. Ernest Minor Patterson, the Hon. Herbert C. Hoover, and Dr. Charles E. Merriam. The address of the Academy is 3622 Locust Street, West Philadelphia, Pa.

POLITICAL ECONOMY. Subjects in the field of economics are treated in this volume under the following heads: BANKS AND BANKING; BUSINESS REVIEW; FINANCIAL REVIEW; CHILD LABOR; COÖPERATION; LABOR; LABOR ARBITRATION AND CONCILIATION; LABOR LEGISLATION; MATERNITY PROTECTION; MINIMUM WAGE; OLD-AGE PENSIONS; STRIKES AND LOCKOUTS; UNEMPLOYMENT; WOMEN IN INDUSTRY; WORKMEN'S COMPENSATION. See also such articles as: CHILD WELFARE; LABOR, AMERICAN FEDERATION OF; STATISTICS; SOCIALISM; TRADE UNIONISM; WELFARE WORK.

See also the articles on AGRICULTURE, the various crops, etc. Further discussions are to be found in articles on the several industries, minerals, public utilities, etc., and in sections on economic conditions in the articles on the individual countries. Books on political science and economics for the general reader are noted in LITERATURE, ENGLISH AND AMERICAN, paragraph, *Economics and Politics*.

POLITICAL SCIENCE, ACADEMY OF. A national institution for advancing the political sciences and promoting their application to public problems; founded in 1880 in New York City, and incorporated in 1910 under the membership corporation law of the State of New York. On Dec. 31, 1928, it had 6853 members, of whom ten were honorary members, 215 life members, and approximately 1100 subscribing members, chiefly libraries and organizations. All States in the Union, the District of Columbia, Porto Rico, Hawaii, the Philippine Islands, and leading foreign countries are represented in both the individual and subscribing memberships. Two general meetings were held in 1928. The semi-annual meeting was held on April 11, at the Hotel Astor, New York, to discuss "Fact-finding in Labor Disputes." Three sessions were held dealing with (1) Courts or Voluntary Agencies; (2) Trade Union and Employee Representation Plans; (3) Present Needs in Industry. The papers and addresses, with some additional material and a prefatory note giving some account of the meeting and information concerning the speakers, were published in *The Proceedings*, vol. xiii, No. 1, under the title, "Fact-finding in Labor Disputes," June, 1928.

The annual meeting, held November 23, was devoted to the subject, "The Preservation of Peace." Three sessions were held as follows: (1) The Renunciation of War as an Instru-

ment of National Policy; (2) New Uses for the Machinery for the Settlement of International Disputes; (3) The Pact of Paris. The papers and addresses prepared for the meeting were published in *The Proceedings*, vol. xiii, No. 2, published January, 1929, together with some account of the meeting. Four issues of the *Political Science Quarterly*, the official organ of the Academy, were published during the year. The officers for the year were: Samuel McCune Lindsay, president; Albert Shaw and Paul M. Warburg, vice presidents; Parker T. Moon, secretary and editor of the publications; George A. Plimpton, treasurer; and Ethel Warner, executive secretary and assistant treasurer. The headquarters are in Fayerweather Hall, Columbia University, New York City.

POLITICS, INSTITUTE OF. Formed for the discussion of foreign affairs, so as to promote a more sympathetic understanding of the problems and policies of other nations, these annual sessions were inaugurated by the trustees of Williams College in September, 1919. The first session of the Institute was held at Williamstown, Mass., in the summer of 1921. Membership is open to men and women on the faculties of colleges and universities, to writers on foreign politics, to persons engaged in the direction of foreign commerce or banking, to diplomatic and consular officials, to officers of the Army and Navy, to editors, foreign correspondents of the press, and, by invitation, to others who have had training and experience in international law and politics. In 1924 the General Education Board and the Carnegie Corporation joined with Bernard M. Baruch, who had made the first three meetings possible, in financing the movement for a five-year period.

The eighth session of the Institute of Politics met in Williamstown, Mass., Aug. 2-20, 1928. Addresses were delivered by Count Carlo Sforza, former member of the Italian Senate, on "The Responsibilities for the World War: Personal Recollections"; Dr. Chao Chu Wu, Former Secretary of Foreign Affairs of the Nanking Government, on "The Domestic and Foreign Programme of the Kuomintang"; Dr. Y. C. James Yen, leader of the Mass Education Movement in China, on "The Task of Educating China's Millions for Citizenship." Lecture courses were also conducted as follows: "Modern Turkey and its Problems," by Halide Edib Hanum, leader of the feminist movement in Turkey; "Germany's Foreign and Domestic Policies," by Dr. Otto Hoetzsch, member of the Reichstag and Professor of History at the University of Berlin; "Current Political Problems in Belgium," by Dr. Louis Pierard, Member of the Belgian Parliament and Reporter of the Budget of the Ministry of Foreign Affairs; "Means of Social Direction," by Dr. Graham Wallas, Professor Emeritus of Political Science at the University of London.

The following is a list of the Round-Table subjects with their respective leaders: "The Problems of the Pacific," George H. Blakeslee, Clark University; "Protection of Citizens Abroad," Edwin M. Borchard, Yale University; "Inter-American Economic and Commercial Relations," Harry T. Collings, University of Pennsylvania; "Agriculture and the Agricultural Surplus: An International Approach," Charles R. Fay, University of Toronto; "Recent Inter-American Relations and Problems," Charles W.

Hackett, University of Texas; "Modern Turkey and its Problems," Halide Edib Hanum, London; "Population Problems on the Pacific Rim," Roderick D. McKenzie, University of Washington; and "Social Direction," Dr. Graham Wallas, London School of Economics. There were also four general conferences devoted to "Problems of Africa," and conducted by Dr. Raymond L. Buell, of the Foreign Policy Association; and general conferences on "The Kellogg Treaties" and "Prohibition."

There were 218 members in attendance at the 1928 meeting, representing 27 states and 10 foreign countries. The Institute publishes an annual report including an outline and selected bibliography for each of its conferences, and a summary of all the main ideas developed by the conference leaders, lecturers, and members of the Institute. Copies of these publications may be obtained from the office of the Secretary, 1 Hopkins Hall, Williamstown, Mass. The ninth session of the Institute of Politics was set for Aug. 1-30, 1929. The officers of administration in 1928 were Harry Augustus Garfield, chairman; Walter Wallace McLaren, executive secretary; and Willard Evans Hoyt, treasurer. Headquarters are at 1 Hopkins Hall, Williamstown, Mass.

POLO. A series of international matches between the United States and Argentina featured polo in 1928. These contests played at Meadow Brook, Westbury, L. I., September 29, October 3, and October 6 aroused intense enthusiasm and were attended by more than 100,000 persons. The third and deciding match won by the United States attracted a crowd of more than 40,000, the greatest throng that ever witnessed competition in this sport. The American team in the first and second struggle was composed of W. A. Harriman, Thomas Hitchcock, Jr., Malcolm Stevenson, and F. W. C. Guest. The Argentinian line-up in all three matches comprised Arturo Kenny, Jack D. Nelson, John B. Miles, and Lewis L. Lacey.

The opening contest resulted in a victory for the United States players by the close score of 7 to 6, a sensational goal by Harriman in the last chukker deciding the outcome. The Argentinians captured the second game rather easily by a tally of 10 to 7. Following this reverse, the United States team received a thorough "shaking up," Earl A. S. Hopping being placed at No. 2 and Hitchcock being shifted from No. 2 to No. 3. The revised United States line-up, composed now of a quartet of youngsters, swept through to a thrilling victory, scoring ten goals in a row for a total of 13 to 7.

The open and Monty Waterbury Cup tournaments were pushed into the background by the international clash. A four, comprising C. V. Whitney, F. W. C. Guest, John B. Miles, and Malcolm Stevenson, captured the open series, defeating a Sands Point four led by Thomas Hitchcock, Jr., by one goal. The associates of Hitchcock were W. A. Harriman, E. T. Gerry, and Stewart B. Inglehart, Jr. Hitchcock's team, however, won the Monty Waterbury Cup final from the Army four by 13 to 11.

Yale took the intercollegiate outdoor title for the second successive year but lost the indoor crown to the Pennsylvania Military College by a score of 7½ to 6½.

PORCUPINE. See *Mammals* under Zoölogy.

PORK. See LIVESTOCK.

PORTLAND CEMENT. See CEMENT.

PORTO RICO, pór'tō-rēkō. An island possession of the United States in the West Indies; the most easterly and the smallest but most densely populated of the Greater Antilles; lying 480 miles east of Cuba, 1380 miles southeast of New York. Capital, San Juan.

AREA AND POPULATION. The area of the island is 3435 square miles and the population, according to the census of 1920, 1,299,809. On June 30, 1928, the population was officially estimated at 1,454,047, or 425 per square mile, about 27 per cent of whom live in cities. The movement of population in 1928 was: Births, 53,085; deaths, 29,682; marriages, 10,376. The capital, San Juan, had a population of 70,707 in 1920, estimated in 1928 at about 100,000. Other important towns are Ponce (41,561) and Mayaguez (19,069). Later estimates for population credited Ponce with about 77,000 and Mayaguez with about 50,000.

EDUCATION. Elementary education is free and compulsory between the ages of 8 and 14. According to the Governor's annual report for the fiscal year 1928, in the publicly supported schools of all grades under the Department of Education, there were employed 4478 teachers. The total enrollment for the year was 220,940. Of this number, 127,930 were enrolled in the rural schools, 86,083 in the elementary urban schools, 6790 in the secondary schools, and 137 were special students. In addition to those enrolled in the public schools, 7365 were enrolled in private schools. The total expenditure for educational purposes by the Department of Education was \$4,328,890. In addition, \$1,505,576 was disbursed by municipalities from their own funds. The total amounted to \$5,834,467. Of this amount \$37,250 was expended for high-school education, and the remainder for elementary education. The University of Porto Rico had an enrollment of 3404 in all its various schools in 1927-28.

PRODUCTION, ETC. Porto Rico is dependent upon sugar production for its prosperity, but other important products are tobacco, coffee, fruits, and articles of hand needlework. Although sugar is not so important an item in Porto Rico as it is in Cuba, economic and commercial conditions largely follow the trend of this commodity. The crop of sugar in 1928 was the largest ever produced in the island, 748,677 tons, as compared with 629,133 tons in 1927. Sugar prices continued low, however, throughout the year, the money value of the total amount exported being \$54,579,020, which was only slightly smaller than the total of the preceding year which was \$54,756,984. There was a marked increase in the production of sugar during four years. The four-year average for 1925-28 was 660,365 tons, while the preceding 10-year average was only 440,293 tons. This was an increase of about 50 per cent with no material increases in acreage. The increases were obtained in great part by varietal selection and the successful control of cane diseases.

The tobacco crop of the year was less than normal, but the prices received were much better than the preceding year. The crop of 1927-28 was only 22,000,000 pounds and the amount exported was valued at \$20,777,937. The crop of 1926-27 was 50,000,000 pounds, but the amount received

was only \$24,860,072. The coffee crop of the year was the lowest in amount produced during the last 30 years. The exports amounted to only 7,837,800 pounds valued at \$2,596,872. The amount exported the previous year was 19,353,581 pounds, with a value of \$5,747,932. The cause of the falling off of the crop was principally due to the severe storm of 1926, which seriously impaired the vitality of the coffee trees. The production of fruits showed an important increase during the year. The total value of fresh and canned fruit exported was \$7,538,794, while that of the previous year was \$6,451,947. The most important fruits are grapefruit, pineapples, and oranges.

COMMERCE. The growth of trade between Porto Rico and the United States and with foreign countries is shown in the accompanying table:

	1900	1914	1924	1928
Brought from United States	\$6,952,114	\$32,568,368	\$80,590,021	\$79,743,088
Shipped to United States	3,350,577	34,423,180	80,754,975	96,662,619
Brought from foreign countries	3,037,391	3,838,419	8,779,603	12,599,241
Shipped to foreign countries	3,261,922	8,679,582	7,525,565	6,872,120
Totals	\$16,602,004	\$79,509,549	\$177,650,164	\$195,877,068

The table shows the steady growth of the commerce of Porto Rico. The total external trade in 1900, two years after the American occupation, was only in round numbers, \$16,000,000. In 1928 it was \$195,877,068. The increase in shipments from Porto Rico to the United States was from \$3,000,000 to \$96,000,000. The increases of purchases by Porto Rico from the United States was from \$6,000,000 to \$79,000,000. The purchases of Porto Rico from foreign countries increased four times; from the United States, thirteen times. The sales of Porto Rican products to foreign countries increased two times; to the United States, thirty-two times. Ninety per cent of all the trade of Porto Rico is with the United States. The decline in value of the exports from 1927 to 1928 was in part due to the low price of sugar. Another contributing factor was the falling of coffee exports. The four principal products produced in and exported from Porto Rico are sugar, tobacco, coffee, and fruits. See above, under *Production*.

FINANCE. The actual cash receipts of the Insular Government for the fiscal year 1927-28 amounted to \$12,446,219. This was the largest amount ever collected in Porto Rico, and exceeded by \$1,087,394 the amount collected the preceding year. It also exceeded the treasurer's revised estimate by the sum of \$165,219. The total amount of receipts and expenditures from whatever source is shown in the following table:

<i>Receipts</i>	
Cash balance on hand July 1, 1927	\$ 128,257
Revenue receipts	12,446,219
Non-revenue receipts	2,968,335
Total	\$15,542,811
<i>Disbursements</i>	
Appropriations	\$10,762,822
Repayments, etc.	2,688,086
Redemption bonds	52,500
Asphalting of roads	58,000
Capitol and Park	104,500
Floating debt	1,117,104
Total	\$14,784,013
Cash balance on hand	\$758,797

It will be noticed that after paying in full all the obligations of the year, and paying \$1,117,104 on the floating debt, which was incurred by reason of loss of revenue caused by litigation preventing the collection of taxes, there remained a cash balance on hand at the close of the year of \$758,797. The bonded indebtedness of the Insular Government on June 30, 1928, was \$25,517,000 as compared with \$22,517,000 on July 1, 1927. The increase was due to public improvement and irrigation bonds.

LEGISLATION. The regular session of the legislature met on February 13 and adjourned on April 15. Eighty-six bills and sixty-three joint resolutions were approved by the governor and ten bills and five resolutions were vetoed. Thirty-seven other bills and forty-seven additional joint resolutions met a similar fate, owing to the

fact that they were not signed by the governor within thirty days after the adjournment of the legislature. The regular quadrennial elections for members of the legislature were held on Nov. 6, 1928.

OFFICERS. The members of the government at the end of the year were: Governor, Horace M. Towner; Attorney-General, James R. Beverly; Treasurer, Juan G. Gallardo; Commissioner of the Interior, Guillermo Esteves; Education, Juan B. Huyke; Agriculture and Labor, Carlos E. Chardon; Health, Dr. Pedro N. Ortiz; Auditor, Frederick G. Holcomb; Executive Secretary, Eduardo J. Saldana.

HISTORY. Throughout the year there was considerable discussion pro and con concerning the status of Porto Rico in the American Government. The Porto Ricans took advantage of the Pan-American conference at Havana and the good-will flight of Colonel Lindbergh to press their claim for self-government. When Colonel Lindbergh visited the island, he was presented with a concurrent resolution of the Porto Rican Legislature, which contained the following message to Americans:

* * * Welcome to our island, Colonel Lindbergh: welcome to the only place under the shadow of Old Glory where the discoverer ever set foot. Welcome, worthy son of the American Eagle. Welcome, Lone Eaglet. The good wishes of Porto Rico will go with you to the land of the brave and the free; and to your country and to your people you will convey the message of Porto Rico, not far different from the cry of Patrick Henry: "Liberty or death." It is the same in substance, but with the difference imposed by the change of times and conditions. The message of Porto Rico to your people is "Grant us the freedom that you enjoy, for which you struggled, which you worship, which we deserve, and you have promised us." We ask the right to a place in the sun—this land of ours, brightened by the stars of your glorious flag.

Previous to the delivery of this message for the American people, Antonio R. Barcelo, President of the Senate of Porto Rico, and José Tous Soto, Speaker of the House of Representatives, sent a joint telegram to President Coolidge which, after congratulating him on his speech delivered at Havana, went on to complain that Porto Rico was the only Spanish-American

country not invited to the conference and asked for the following solution to the Porto Rican problem:

If the United States, because precedent forbids it, or because of different ethnological conditions, or because of our geographical separation from the North American Continent, or because of the incompatibility of interests between both peoples, cannot make of our island but a mere subjected colony, then we ask to be allowed to be constituted as a free State, concerting thus with your great Republic such good and fraternal relations as may be necessary for the mutual welfare of the United States and Porto Rico and to the dignity of our citizens.

Justice, and nothing but justice, is what we ask as citizens of America, as faithful Christians, and as children of the Almighty God that gave us the same inalienable rights your Great Republic knew how to invoke when declaring for independence at the memorable convention at Philadelphia.

On February 28, President Coolidge replied to the above telegram of February 28. In a terse and somewhat sharp letter to Governor Towner, he reviewed the history of Porto Rico under American ownership and pointed out the advantages which had accrued to the island from that ownership. The final paragraph of the letter destroyed any hopes that the Porto Ricans may have had for independence of self-government or any change at all in the *status quo*.

There is no disposition in America, and certainly not on my part, to discourage any reasonable aspiration of the people of Porto Rico. The island has so improved and its people have so progressed in the last generation as to justify high hopes for the future, but it certainly is not unreasonable to ask that those who speak for Porto Rico limit their petitions to those things which may be granted without a denial of such hope. Nor is it unreasonable to suggest that the people of Porto Rico, who are a part of the people of the United States, will progress with the people of the United States rather than isolated from the source from which they have received practically their only hope of progress.

The Porto Rican Legislature made a long reply to this letter of President Coolidge, the opening paragraphs of which will serve to indicate the entire tone of the communication.

We are not urging upon the American people either independence or statehood. If statehood is offered to our people now, it is our honest belief that Porto Rico would not, could not, refuse the honor that statehood implies in spite of such financial difficulties as we would have to solve with the aid of Congress. If independence is tendered to us, we will accept independence on the same basis as our sister Cuba. But we suggest as a compromise between these extreme solutions a form of government that is neither statehood nor independence, but which, however, participates of both forms with the advantages of both and without the disadvantages of either.

We limit our ambitions for the present to an elective governor, leaving to the President the power of removal for cause. We apprehend the objections that can be raised against our interference in purely national affairs; but in compensation for this limitation, and on account of our peculiar conditions, we do not seek power to frame our own tariff, as was the case under the autonomic charter, but we do seek authority to reduce the national schedules on raw food staples so as to place the same within the reach of our laboring population; and also the power to increase tariff rates on products similar to those of our soil not produced in Continental United States when such products of ours are unprotected by the national tariff. We want the jurisdiction of the Federal Court restricted in civil matters to suits in which the construction of the Federal Constitution or of the Constitution of Porto Rico, is in question, and also that Federal jurisdiction be vested, as in the case of the Territories, in the Supreme Court of Porto Rico, which is wholly appointed by the President with the consent of the United States Senate. This would absolutely guarantee the sovereign powers of the nation.

The economic situation in September was dominated by the effects of the tropical hurricane which swept over the island on the 13th. Sur-

veys of the destruction reported widespread damage. The estimated damage to sugar-mill buildings was placed at 30 per cent of the valuation, but the machinery losses were reported as negligible. Stored tobacco stocks were also estimated to have been 30 per cent destroyed. The loss of fruit trees was placed at 10 per cent. It was expected that insurance would cover a large part of the damage, but the effect of the storm would probably be felt in agriculture and trade for some years to come. More than 200 persons lost their lives and upward of 2000 were wounded. A large sum of money was raised in the United States to aid the sufferers through the medium of the Red Cross.

PORTS AND HARBORS. GREAT LAKES.

River and harbor works on the Great Lakes under the United States Engineer Corps continued throughout the year. Dredging operations involved deepening the channel at Sandusky, Ohio, to 22 feet by removing 280,000 cubic yards of ledge rock; an extensive dredging operation on the up-bound, Middle Neebish Channel at St. Mary's River, Michigan; deepening the outer channel at Green Bay, Wisconsin, to 21 feet; as well as general contract and government dredging at numerous other lake ports. A plant for making concrete caissons was maintained by the Government at Milwaukee and 60 caissons were built there during the year for breakwater construction at Milwaukee, Frankfort, and Muskegon harbors. The size of these works is indicated by their lengths, 5600, 2600, and 3200 feet. In general, all pile and crib structures under government control were being gradually replaced by concrete.

Plans for extensive improvements, to cost over \$4,000,000, in the harbor facilities at Chicago were made public during the year. These involved not only municipal pier construction but also two barge terminals and considerable channel and dredging work.

MOBILE, ALABAMA. The new port and dock facilities were dedicated and opened to public use on June 25, 1928. The work had been done by the State through a Port Authority of which General Sibert was chairman, chief engineer and general manager, and involved the improvement of an area of 550 acres as a great ocean terminal with docks, unloading facilities, warehouses, etc., at a cost of \$10,000,000.

SAN FRANCISCO. The Chief of Engineers submitted a preliminary report advising some modifications of the plan for this harbor. A main channel 45 feet deep and 2000 feet wide is advised as well as the removal of several rocks, reefs, and shoals in the harbor.

BRAZOS RIVER—FREEPORT, TEXAS. An especially interesting project was under way to divert the Brazos River by a dam, carry it to the Gulf of Mexico in a new channel, and thus prevent the constant shoaling of the bar across the Freeport harbor entrance which has resulted after each flood of the river. In 1923 the project was abandoned after examination, but in 1925 further examination was made and the channel, for about 12 miles, was to be made an arm of the Gulf of Mexico with a dredged depth of 25 feet for navigation.

LOS ANGELES. One of the most important American works to be brought forward during the year was the plan for harbor breakwater and port facilities at Los Angeles. The project was approved by the city council and was to cost 18

million. A consolidation of railroad facilities and a unification of present works at Long Beach Harbor for operating purposes was involved. It was expected that the cost would be met in part by the Federal Government. The four railroads having terminals at Los Angeles entered into an operating agreement for combined facilities with the city under a general operating company.

VANCOUVER, B. C. A project to reduce the heavy currents and secure a tideless, fresh-water harbor at Vancouver was proposed. A dam across the Second Narrows, with a small and a large lock, is the principal feature of the design.

PORT OF BARI, ITALY. Harbor construction at this ancient port on the southeast coast of Italy, completed some 20 years ago, having proved inadequate, a new construction to be built in parts was under way. The old works consisted of two encircling breakwaters built out from the bay west of the Old Port. The new work ultimately was to consist of two similar but larger breakwaters which would encircle the old with an outer sea wall protecting the entrance. The old east breakwater was to be used as part of a new dock construction which would provide ample dock and pier facilities. The new breakwater construction (see *Engineering*, Mar. 2, 1928) was to be of concrete blocks on a sloping stone base. The precast, interlocking blocks are of unusual size and the construction is notable both for its character, size, and the exposed location of the work.

BIBLIOGRAPHY. A valuable series of memoirs on the Western Ports of the North Atlantic is being published in *Engineering*, the well-known British journal. They are by Brysson Cunningham and those for the year (Nos. 5-6) include Boston and Quebec. Previous issues cover Montreal, New York, Philadelphia, and Baltimore. A description and plan of the Port of Southampton appeared in the issue of June 29, 1928, as well as an interesting article on increased dock facilities at Avonmouth on May 11, 1928.

In the Port Series, brief descriptions of the ports of the United States published by the Board of Engineers for Rivers and Harbors of the United States War Department, No. 21 of the series on the Ports of Porto Rico was published in 1927. No. 22, on the Panama Canal and its Ports, appeared in 1928.

The publication *World Ports*, the monthly bulletin of the American Association of Port Authorities, Association of Pacific and Far East Ports, and Society of Terminal Engineers, published at New Orleans, continued to run interesting descriptions of port facilities, etc.

The *Mémoires de la Société des Ingénieurs Civils de France* for 1927 contains articles on the Port of Casablanca, the principal port of Morocco, and a series on transportation facilities in Poland which includes an article on ports.

Le Génie Civil (Paris), Aug. 4, 1928, had an interesting article on new electric cranes for dock work as used in the Port of Santander, Spain, and, September 29, on a floating crane of 450 tons capacity for the port of Algiers. *Engineering*, August 10, carried an article on Admiralty Floating Docks. An important new work of the year on this subject was by F. M. DuPlat-Taylor, *The Design, Construction, and Maintenance of Docks, Wharves, and Piers*, London.

PORTUGAL. A republic of Europe, situated west of Spain in the Iberian Peninsula, the

westernmost of all the States of Europe. It includes the Azores and Madeira. Capital, Lisbon.

AREA AND POPULATION. The area of Continental Portugal is 34,254 square miles; population, according to the census of 1920, 5,621,977, as compared with 5,545,595 in 1911. The Azores, with in area of 922 square miles, had a population of 242,613 in 1920; and Madeira, with an area of 314 square miles, a population of 169,777 in 1920; the total area, therefore, may be considered 35,490 square miles and the population in 1920 may be placed at 6,032,991, because the Azores and Madeira are considered integral parts of the Republic. The Portuguese colonial possessions in Africa and Asia had an estimated area of 936,264 square miles, with a population of 8,737,853, of which 927,292 square miles, with a population of 7,736,700, were in Africa. Lisbon, the capital, had a population at a special census in 1925 of 529,524 and Oporto, the next largest city, 203,091 (1920). Primary education is compulsory. In 1924-25 there were 6850 public elementary schools, 33 secondary schools, and five primary normal schools. For higher education there are three universities.

PRODUCTION, ETC. Portuguese agricultural returns during 1927 were exceptionally good and the large crops assisted in preventing any financial and exchange crisis. Wine production was more than double that of 1926, and the olive-oil crop was the largest in many decades. Other products also showed a marked gain over the previous year. Good prices were obtained for cork of which the entire product is practically exported. Of the total area of Continental Portugal, about 26 per cent is either annually cultivated or under meadows and pasture, about 8 per cent is under vineyards and fruit, 17 per cent under forests, and 49 per cent is waste land. The value of some of the principal crops in 1926 was as follows: Wheat, \$19,966,000; corn, \$16,080,000; potatoes, \$7,953,000; rye, \$5,219,000; and oats, \$3,841,000. The area of olive orchards in recent years had averaged about 825,000 acres, producing 39,110,000 gallons of oil in 1927. In 1925 there were 768,000 cattle, 1,117,000 swine, 3,684,000 sheep, 1,558,000 goats, 30,000 horses, 236,000 asses, and 88,000 mules.

Mineral production in 1925 included 122,000 metric tons of coal, 226,000 tons of pyrites and cement ore, and 1032 tons of tin ore. In 1926 there were 6310 persons engaged in mining as compared with 5095 in 1925. The principal manufacturing industry is that of textiles, in which 45,000 operatives were employed in 1924; of these 25,000 were in cotton mills. The amount of raw cotton consumed in 1925 was 31,887,000 pounds. Other manufacturing industries include decorative tile, chinaware, superphosphate of lime (about 100,000 tons annually), embroidery, and handmade lace.

COMMERCE. In 1926, the latest year for which statistics are available, imports totaled \$120,156,000 and exports, \$37,419,000. These figures compare with imports in 1925 of \$124,731,000 and exports of \$43,448,000. The principal items of import in 1926 were: Codfish, \$7,825,000; wheat, \$7,589,000; cotton, \$7,527,000; cotton manufactures, \$7,055,000; sugar, \$5,557,000; and rice, \$4,448,000. The principal items of export were: Wine (other than port), \$14,073,000; port wine, \$11,142,000; sardines, \$5,404,000; and cork, \$4,085,000. In 1927 exports from the

United States to Portugal were reported as \$10,700,000 (compared with \$11,600,000 in 1926). Imports from Portugal were \$4,600,000 (compared with \$5,600,000 in 1926).

FINANCE. The budget for 1927-28 provided total receipts of 1,459,378,000 escudos, collected from the following sources: Direct taxes, 312,038,000; stamp and registration, 179,600,000; indirect taxes, 535,047,000; dividends, interest, etc., 132,847,000; all other ordinary receipts, 262,461,000; extraordinary receipts, 37,385,000. The total expenditures were 1,848,045,000 escudos, distributed as follows: Debt service, 401,668,000; national defense, 483,779,000; public instruction, 157,808,000; all other ordinary expenses, 571,067,000; extraordinary expenditures, \$233,723,000. The debt of July 1, 1926, consisted of: Internal funded debt, excluding that held by the Government, 773,051,000 paper escudos (\$39,658,000) and 21,303,000 gold escudos (\$23,018,000); internal floating debt, 1,679,632,000 paper escudos (\$86,165,000); external funded debt, £33,025,000 (\$160,716,000); external floating debt, £23,918,000 (\$116,397,000). The gross amount of the internal funded debt was 4,791,389,000 paper escudos, of which the Government held 4,018,338,000.

COMMUNICATIONS. In 1927 Portugal had 282 vessels of 100 tons or more each, with a total capacity of 258,448 tons. This compares unfavorably with a total tonnage of 301,607 tons in 1923. In 1925, 7891 vessels of 21,264,718 tons entered, and 7873 vessels of 21,486,967 tons cleared the ports of Portugal. On Jan. 1, 1926, the total length of railway in the country was 2005 miles of which 825 represented government-owned lines.

GOVERNMENT. According to the constitution of 1911, executive power is vested in the President, elected by the Parliament for four years but ineligible for reelection, who acts through a responsible ministry; and legislative power in a Parliament of two chambers, the Upper House having 71 members elected by the municipal councils and the Lower House 164 members elected for three years by direct suffrage. Acting President in 1928, General Antonio Oscar de Fragozo Carmona (appointed in December, 1926). The cabinet as reconstructed on Aug. 26, 1927, is as follows: Prime Minister, General Carmona; Interior, José de Freitas; Foreign Affairs, A. M. de B. Rodrigues; Finance, General de Cordes; Justice, Dr. Manuel Rodrigues; War, Abilio A. de Passos e Sousa; Marine, Commander Portela; Colonies, A. I. Ferraz; Instruction, José A. M. de Magalhães; Commerce and Communications, A. Machade e Costa; Agriculture, General Pedrosa.

HISTORY. The dictatorship established by General Carmona in 1926 weathered the storm of a rather hectic year in Portugal. The wily military chieftain decided in the early part of the year to hold an election to make his provisional government a regularly constituted body. As was the custom in most countries where there was a military rule, provision was made by the Government to make sure that the returns would be satisfactory to the party in power. There was considerable opposition to the promulgated election law, but the "outs" were too helpless to do more than protest. The election was held on March 25, and, as everybody predicted, General Carmona, who was the only candidate, was elected, thus legalizing his régime. At approxi-

mately the same time the League of Nations, after an investigation of the resources of the country, refused to grant an uncontrolled loan to the Government. See LEAGUE OF NATIONS.

A revolt against the Carmona government occurred on July 20, but according to press dispatches, the Government had little difficulty in suppressing it. The movement was followed by the usual wholesale arrests and deportations. It was stated that several former cabinet members instigated the revolt but were only able to induce a small part of the army to join it. The bulk of the army remained loyal to General Carmona, hence he stayed in power. The remainder of the year passed in comparative quietude, although there were cabinet changes from time to time.

PORTUGUESE EAST AFRICA, or MOZAMBIQUE. A colony of Portugal, extending along the coast of Africa from 10° 40' S. latitude to the boundary of the Union of South Africa; bounded on the west by the Union of South Africa and Rhodesia, and on the north by Tanganyika. Area, 428,132 square miles. The estimated population is 3,657,008. There are three clearly defined divisions of the colony: (1) the Province of Mozambique, 295,000 square miles; (2) the territory under the Mozambique Company, 59,840 square miles; (3) the district under the Nyasa Company, 73,292 square miles. In addition, there is the "Kionga Triangle," formerly belonging to German East Africa, situated south of Rovuma, which was allotted to Portugal by the Treaty of Versailles. Lourenço Marques, the capital and chief port for foreign trade, had a population, according to the latest available statistics, of 13,154. Other ports are Mozambique, with a population of about 361,839 (472 Europeans): Ibo, Chinde, Beira, Quilimane, and Inhambane. The chief products are beeswax, coconuts, sugar, and mineral products. Rubber and ivory are exported. Imports in 1926, exclusive of gold and silver, amounted to 254,141,000 escudos and exports to 248,479,000 escudos. The proposed provincial budget of Portuguese East Africa for the fiscal year 1927-28 balanced at 399,701,814 escudos (\$19,985,090).

PORTUGUESE GUINEA, gī'nē. A colony of Portugal on the west coast of Africa, entirely surrounded on the land side by French territory. It includes the archipelago of Bijagoz, together with the island of Bolama on which is situated the capital, Bolama. Area, estimated at 13,940 square miles; population according to the census of 1924, 770,791. The principal port is Bissau. The chief products are wax, rubber, ivory, hides, and oil seeds. The imports in 1925 were valued at 50,337,548 escudos; exports at 45,590,992 escudos. The estimated public revenue for 1926-27 was 19,966,900 escudos and the expenditure, 19,685,239 escudos.

PORTUGUESE WEST AFRICA. See ANGOLA.

POST, LOUIS FREELAND. American lawyer, economist, and author, died at Washington, D. C., January 10. He was born at Vienna, N. J., Nov. 15, 1849, and received a public-school education. While working as a printer he studied law, and he was admitted to the bar of New York in 1870. In 1874-75 he was assistant U. S. Attorney at New York. From 1879 to 1882 he was an editorial writer for the New York *Daily Truth*, but in 1883 he returned to the practice of law, which he finally abandoned in 1890 for a career

as an editor, publicist, and public official. He had become interested in 1881 in the theories of economics of Henry George, advocate of the "single tax," and he became one of the foremost expounders of the theories. At various times in the eighties, he ran for offices on the Labor and Greenback tickets. In 1886, when Henry George ran for Mayor of New York, Mr. Post edited his campaign paper, the *Daily Leader*. After acting as editor of the *Standard*, of New York, and the *Record*, of Cleveland, Ohio, in 1898 Mr. Post founded the *Public*, at Chicago, and with his wife, edited that paper until 1923. For several years it was published at New York. From 1913 to 1921 Mr. Post was Assistant Secretary of Labor of the United States. His course in considering the cases of radicals sentenced to deportation was severely criticized in some quarters as too lenient, but a congressional committee which made an investigation decided not to press impeachment proceedings. Mr. Post wrote: *The George-Hewitt Campaign* (1887); *Ethics of Democracy* (1905; 2d ed., 1916); *The Prophet of San Francisco* (1905); *Ethical Principles of Marriage and Divorce* (1906); *Social Service* (1909); *Land Value Taxation* (5th ed., 1915); and *The Deportations Delirium of 1920*.

POTASH, POTASSIUM. See CHEMISTRY, INDUSTRIAL; FERTILIZERS.

POTATOES. The potato production in 1928 of 22 countries reporting to the International Institute of Agriculture, Rome, was estimated at 3,938,783,000 bushels, a decrease of 5.3 per cent, as compared with the production in 1927 and an increase of 2.6 per cent over the average yield for the five years 1922-1926. The 1928 acreage in those countries was reported as 23,467,000 acres, which was 2.9 per cent above the acreage of 1927 and 4.8 per cent above the five year average.

Europe produces about 90 per cent of the world's potato supply, and production in European countries greatly influences the grand total. Among the important producing countries, Germany reported a decrease of 1.2 per cent, Poland of 11.9 per cent, and Czechoslovakia of 24.6 per cent, as compared with their yields in 1927. The 1928 production of the leading countries outside the United States was reported as follows: Germany, 1,363,508,000 bushels; Poland, 1,028,439,000 bushels; Czechoslovakia, 252,470,000 bushels; The Netherlands, 136,684,000 bushels; England and Wales, 124,432,000 bushels; Belgium, 109,759,000 bushels; Spain, 104,718,000 bushels; and Canada, 84,657,000 bushels. The Canadian crop was 9.3 per cent above the yield of 1927. The production of the United Socialist Soviet Republics in 1927 was 2,009,149,000 bushels.

The potato production of the United States in 1928, estimated by the U. S. Department of Agriculture at 462,943,000 bushels produced on 3,825,000 acres or at an average yield of 121 bushels per acre, was the highest ever recorded, being nearly 10,000,000 bushels above the preceding record crop, which was secured in 1922. These figures compared with a yield of 402,741,000 bushels, a planting of 3,476,000 acres, and an average yield per acre of 115.9 bushels in 1927. The average farm price reported was 54 cents per bushel or 42.5 cents under the average

bushel price the year before. At these prices, the total value of the crop of 1928 was \$250,043,000 and of the crop of 1927, \$398,741,000.

As in the preceding years, potatoes were grown in every State and the leading States and their yields were as follows: Minnesota, 38,940,000 bushels; Maine, 37,840,000 bushels; Michigan, 35,802,000 bushels; New York, 32,376,000 bushels; Pennsylvania, 31,980,000 bushels; Wisconsin, 31,970,000 bushels; Virginia, 21,593,000 bushels; and Idaho, 19,720,000 bushels. In average yield per acre, Maine led with 220 bushels, followed by Idaho with 170 bushels and New Jersey with 160 bushels. All other States produced less than 150 bushels per acre, including fourteen with less than 100 bushels per acre. The average farm prices reported for the different States ranged from 30 cents in Minnesota and North Dakota to \$1.50 in Florida. Maine, Michigan, and Wisconsin reported an average farm price of 40 cents per bushel.

The cost of potato production in 1927, according to results of a study by the Department of Agriculture, was from 72 to 80 cents per bushel in the Eastern, Northeastern, Southeastern, and West South Central States, and from 49 to 58 cents per bushel in the Western, North Central, and Central States. The exports of potatoes for the fiscal year ended June 30, 1928, as reported, amounted to 2,424,000 bushels, while the imports reached to 228,303,000 pounds or 3,803,550 bushels.

Early in the year it was reported that the feeding of potatoes to livestock was a growing practice in the Northwest. During the winter of 1927-28 nearly a million sheep and many cattle in the Yakima Valley, Washington, were wintered on potatoes, which sold for this purpose at \$5 per ton. A study by the Department of Agriculture of the utilization of the 1927 potato crop in the 35 States producing 370,276,000 bushels of late potatoes indicated that 31,260,000 bushels or 8.4 per cent of the crop were unfit for food or seed, 56,074,000 bushels or 26.8 per cent were saved for food on farms, 35,478,000 bushels were saved for seed, and the balance of 274,464,000 bushels was available for sale. See HORTICULTURE.

POTHIER, ARAM J. American banker and Governor of Rhode Island, died at Woonsocket, R. I., February 4. He was born in Quebec, Can. July 26, 1854, and was of French-Canadian descent. He studied at Nicolet College until he was sixteen, and then went with his parents to Woonsocket, R. I. His first employment was as a clerk in a grocery and in 1875 he became a clerk in the Woonsocket Institution for Savings, with which bank he remained until his death; he was president of the institution for many years. He had other large business interests. Mr. Pothier's first political office was that of member of the Rhode Island House of Representatives, 1887-88; he was city auditor of Woonsocket, 1889-94; mayor, 1894 and 1895; Lieutenant-Governor of Rhode Island in 1898, and Governor of the State, 1909-15 and from 1925 until his death. He had the distinction of being elected governor seven times, a record equaled in American history by George Clinton only, who was the first Governor of New York State. Mr. Pothier was American commissioner to the Paris expositions of 1889 and 1900. The degree of LL.D. was conferred on him by Manhattan College, Holy Cross College, and Niagara University.

POTTER, CHARLES LEWIS. American military engineer, died at St. Louis, Mo., August 6. Born at Lisbon Falls, Me., Jan. 24, 1864, he was graduated from the United States Military Academy in 1886, and was commissioned second lieutenant in the Fifth Cavalry. A year later he was transferred to the Corps of Engineers and was graduated from the Engineer School of Application in 1889. He served in the Philippines during the Spanish-American War and the Philippine Insurrection, 1898-1900. Upon his return to the United States in 1900, he was stationed at Memphis in charge of the third district of the Mississippi River Commission. He was actively connected with engineering work on the Mississippi River for a number of years, and in 1910 he was made secretary of the Mississippi River Commission. He was district engineer at St. Paul, 1912-15, in charge of river work above St. Paul. He was engaged in government engineering at Portland, Oreg., 1915-16, and at Boston, 1916-17. During the World War, 1917-18, he was director of the gas service at Washington, D. C., and he was given charge of the San Francisco Engineering District from 1918-20. Colonel Potter was appointed president of the Mississippi River Commission on Mar. 19, 1920. He retired on Jan. 24, 1928, being given the rank of brigadier-general, but was recalled for relief work, during the Mississippi flood in the following month, with the Flood Control Commission. To prevent future floods, he advocated an extensive engineering project of floodways and outlets financed by the Federal Government.

POULTRY. See LIVESTOCK; VETERINARY MEDICINE.

POULTRY DISEASES. See VETERINARY MEDICINE.

POWER DEVELOPMENT. See POWER PLANTS, STEAM; WATER POWER.

POWER PLANTS, STEAM. During 1928 the number of new steam central stations completed or projected in the United States was smaller than usual, but extensions to existing stations were numerous and included many units of extremely large capacity. This represented an increase of about 10 per cent in installed capacity which was somewhat less than the increase in output of electricity, but more extensive interconnections of plants and systems as well as increased efficiency of production made up for the difference. The total central station output was approximately 88 billion kilowatt-hours to which must be added 1,600,000 kilowatt-hours imported from Canada.

In the matter of steam pressures, power station designers still were divided into three groups, those adhering to the more conservative pressure of around 400 pounds at the boilers, those in the 600-700-pound class, and those who found increased economy in 1200 to 1400 pounds or more. The last group included an increased number of adherents during the year. For three years, two 1200-1400-pound stations had been in successful operation. These were the Edgar Station of the Edison Electric Illuminating Company of Boston and the Lakeside Station at Milwaukee. The former was installing its fifth high-pressure boiler and third high-pressure turbine, while the latter had two such units in operation. A third installation in this class, the Northeast Station at Kansas City, had gone into service. All three

of these plants employed high-pressure turbines exhausting at medium pressure into the main station system.

Construction was started during the year on the first two stations to be built as complete high-pressure plants, with turbines operating over the whole range from boilers to condensers. These were the Deepwater Station near Wilmington, Del., and the Holland Station at Holland, N. J. The former was being built jointly for the American Gas & Electric Company and the United Gas Improvement Company. Steam will be generated at 1350 pounds, 725° Fahr. temperature and will supply three turbine-generators, two 53,000-kilowatt cross-compound condensing units taking steam over the whole range, and the third, a 12,500-kilowatt high-pressure unit will exhaust at 200 pounds to furnish steam for process to one of the plants of the DuPont Company. At the Holland Station, a W. S. Barstow property, steam will be generated at around 1400 pounds and will supply 55,000 kilowatt cross-compound turbines employing reheat at 400 pounds, 750° Fahr.

In the 600-700-pound class, the Powerton Station at Pekin, Ill., went into service with its first unit of 55,000 kilowatts capacity. The first section of the State Line Station, projected in 1927 and laid out for an ultimate capacity of 1,000,000 kilowatts, was nearing completion and its first turbine of 208,000-kilowatts capacity was soon to be in operation. A 165,000-kilowatt turbine was added to the Philo Station at Philo, Ohio, and one of 104,000-kilowatts at Crawford Avenue in Chicago.

Additions to the 400-pound stations include the new Delray No. 3 plant of the Detroit Edison Company, and large extensions of the Hudson Avenue Station of the Brooklyn Edison Company, The East River Station of the New York Edison Company, the Charles R. Huntley Station at Buffalo, Cahokia at East St. Louis, the Long Beach Station of the Southern California Edison Company and the Hell Gate Station in New York. The last-named in 1928 was the largest steam station in the United States, having a capacity of over 600,000 kilowatts.

While advancement in steam temperatures above 750° Fahr. had been slow, one company was installing a 10,000-kilowatt unit to operate at 1100° Fahr. at the boiler and 1000° at the turbine. A 10,000-kilowatt mercury boiler and turbine went into operation at the South Meadow Station of the Hartford Electric Light Company. See BOILERS.

Among the industrial plants, there was a large number operating at 400 pounds, employing high-pressure turbines which exhaust to process at 50 to 100 pounds, and the number of such plants is steadily increasing. One large plant was operating at 650 pounds, another at 800 pounds, a third at 1000 pounds, and a fourth has one unit operating at 1500 pounds. A sensation of the year was the announcement that the Philip Carey Manufacturing Co., near Cincinnati, would begin construction of a plant to utilize steam at 1400 pounds, in reciprocating engines which would exhaust to process. The boilers were to be designed for 1800 pounds.

The year witnessed much research work in the field of alloy steels to meet the service demands of high pressure and high temperature. Also, furnace design underwent many changes to cope with the demand for high capacities and high

rates of forcing boilers. Stoker sizes were increased and designs improved so as to permit higher combustion rates, greater flexibility of operation, and highly preheated air. Among the smaller industrial plants, the year saw a considerable increase in the application of stokers, due largely to renewed activity on the part of smoke prevention departments in a number of cities.

There was wider appreciation of the fact that the stoker and pulverized coal each had a place according to local conditions, and stoker improvements enabled it to stem the popular trend toward pulverized coal. The latter was still going strong, however, and the unit system is now making headway in the large stations, where formerly the centralized system held the field. Greater refinements were being made in both systems and in burners, based on closer studies of the influence of pulverization fineness and flame reactions. There was also a trend toward larger mills.

In Europe, a number of high-pressure plants had been in successful operation for several years, but these in general were smaller than in the United States. The second Benson boiler was operating in Germany at 3200 pounds, and a third was reported to be under construction. Many of the European countries were devoting much attention to better utilization of fuels, higher efficiencies and adequate power supply in the realization that more power in industry is the key to national prosperity. See STEAM TURBINES; DYNAMO-ELECTRIC MACHINERY.

POWER TRANSMISSION. See ELECTRIC POWER TRANSMISSION.

PRAIRIE PROVINCES. The name applied to the three Canadian provinces of Manitoba, Saskatchewan, and Alberta. Total area, 758,817 square miles (Manitoba, 251,832; Saskatchewan, 251,700; Alberta, 255,285). Population, according to the census of 1926, 2,067,682 (Manitoba, 639,056; Saskatchewan, 821,042; Alberta, 607,584). For production, etc., consult the articles on the respective provinces.

PRATT INSTITUTE. A non-sectarian educational institution at Brooklyn, N. Y., founded in 1887, and composed of four schools; Fine and applied arts, household science and arts, science and technology, and library science. The 1928 autumn enrollment was 4614, divided as follows: Arts, 1707; household science, 900; science and technology, 1980; library school, 27. There were 175 members on the faculty, and 79 special lecturers. The library contained 140,000 volumes. President, Frederic B. Pratt, A.M., LL.D.

PREHISTORY. See ANTHROPOLOGY.

PRESBYTERIAN CHURCH. The Presbyterian Church, with the Reformed churches, rests on features of the Reformation brought forward by Zwingli and Calvin. It consists of bodies in the United States, the British Isles, and elsewhere, following the doctrinal and ecclesiastical system developed in Holland and France and more fully in Scotland under John Knox. The distinctly Presbyterian bodies of the United States are derived for the most part from bodies in Great Britain, but are in many respects similar to the Reformed churches in the United States, sprung from parent bodies in other parts of Europe, and particularly in Holland. The following organizations in the United States bear the Presbyterian name: The Presbyterian Church in the United States of America; Presbyterian Church in the United States (South); United

Presbyterian Church of North America; Cumberland Presbyterian Church; Cumberland Presbyterian Church, Colored; Reformed Presbyterian Church; Reformed Presbyterian Church, General Synod; Associate Synod of North America, also known as the Associate Presbyterian Church; and the Associate Reformed Presbyterian Synod. The Presbyterian churches of the United States have general affiliations with the Alliance of Reformed Churches Throughout the World Holding the Presbyterian System, and also with the General Council of the Presbyterian and Reformed Churches in America, a similar organization of purely American scope. Steps were taken at the meeting of the American section of the World Alliance at Richmond, Va., in 1925, to effect a union of the world and American bodies.

PRESBYTERIAN CHURCH IN THE UNITED STATES OF AMERICA. This is the largest body of the denomination and is represented by churches in every State of the Union and by official mission stations in Alaska, Cuba, Porto Rico, and foreign lands. In 1928 the churches in the United States were organized into 46 Synods and 294 Presbyteries. Statistics for the year ended April 1, showed a net gain in membership for the year of 35,570, and a total membership of 1,962,838. The Sunday-school enrollment totaled 1,614,013, an increase of 17,498 over the previous year. As a result of the movement on foot in the church to dissolve churches having a nominal existence and to combine churches where possible, the number was decreased by 65, giving a total of 9432, including 54 churches organized during the year as against 78 which were dissolved. The number of ministers had increased from 9497 in 1927 to 10,013 in 1928. Contributions during the year amounted to \$64,598,530, the largest amount ever raised by the denomination in one year, and an increase of \$1,815,623 over the previous year. Of the total income, \$48,525,779 was used for congregational expenses, while \$15,642,508 was devoted to benevolences, including \$4,195,640 given to the Board of National Missions; \$3,667,962 to the Board of Foreign Missions; and \$817,029 to the Board of Christian Education; the Board of Pensions received \$524,736 of the total contributions to benevolences, and in addition \$5,457,600 from subscriptions to its \$15,000,000 special fund. The denomination maintained 56 colleges and 13 theological seminaries. The official medium of the denomination is the *Presbyterian Magazine* (monthly). Privately owned Presbyterian periodicals are the *Presbyterian Advance*, the *Presbyterian Banner*, and the *Presbyterian* (all weekly). The Rev. Hugh Kelso Walker, D.D., LL.D., of Los Angeles, Calif., was Moderator of the General Assembly for 1928-29, the 1928 meeting of which was held at Tulsa, Okla., May 24-30. The chief permanent officer is the Stated Clerk, who in 1928 was Dr. Lewis Seymour Mudge, D.D., LL.D., 514 Witherspoon Building, Philadelphia, Pa.

PRESBYTERIAN CHURCH IN THE UNITED STATES (SOUTH). This division of the Presbyterian denomination covers the territory commonly known as the Southern States. It was composed in 1928 of 17 Synods and 90 Presbyteries, with 3596 organized churches and 2342 ministers. The ruling elders numbered 15,730, and deacons, 17,390. The total church membership was 444,657; the Sunday-school enrollment, 431,065. Contributions for the year were: Current expenses, \$10,306,188, a gift of \$23.18 per capita; and benevolences, \$5,520,285, a gift of \$12.40 per capita, making

the total gift per member \$35.58. This church had sent out and was supporting 484 missionaries in six countries—Africa, Brazil, China, Japan, Korea, and Mexico. These missionaries were assisted by 3099 native workers. In the six countries there were 44,278 church members and 70,104 members of Sunday schools. The office of the General Assembly and Bureau of Vacancy and Supply is located in Dallas, Texas. The Rev. J. D. Leslie, D.D., LL.D., is Stated Clerk and Treasurer.

PRESBYTERIAN CHURCH OF NORTH AMERICA, UNITED. A branch of the Presbyterian Church formed by the union of the Associate and the Associate Reformed churches (Secession and Covenanter) effected in Pittsburgh in 1858. It represents the earlier covenanter and secession movements of the denomination in Scotland, from which it inherited whatever was distinctive in their views and usages. In organization and government it is in accord with other Presbyterian bodies, having the same courts-session, presbytery, synod, and general assembly, and observing the same general methods of baptism, admission to church membership, and ordination to the ministry. The General Assembly convened in St. Louis, Mo., May 23, 1928. On that date there were 11 synods, 57 presbyteries, 898 congregations, 916 ministers, 5053 ruling elders, and a church membership of 175,075 in the United States. The total membership, including missionary fields, was 238,240; the Sunday-school enrollment was 177,589; there were 958 Young People's societies, with a membership of 26,225; and 1634 missionary societies. The average pastor's salary was \$2435; congregational expenses amounted to \$4,150,165; total contributions, \$6,224,733, an average per member of \$35.55; and missionary contributions, \$1,639,382, an average of \$9.36 per member. The denomination supported 400 men and women in four foreign-mission fields, and 411 men and women in homeland missions. It carried on medical work in 31 foreign hospitals and dispensaries; conducted educational work in 333 schools at home and abroad; maintained 9 colleges and 4 theological seminaries at home and abroad; reached 35,000 youths in its schools and colleges, and graduated more than 600 young men and women. New houses of worship were erected during the year at a cost of \$663,800, and the total estimated value of the church property of congregations was \$27,886,747; value of parsonages, \$3,443,545; value of property and permanent funds of the mission boards, \$8,846,917; value of property and permanent funds of the colleges and seminaries \$7,653,124; total value of property and permanent funds of the denomination, \$47,830,333. The official organ of the Church is the *United Presbyterian*, a church-owned yet independent weekly, published at Pittsburgh, Pa. The Rev. W. A. Spalding, D.D., of Albany, Oregon, was the Moderator of the General Assembly, and D. F. McGill, D.D., LL.D., Bellevue, Pa., was Stated Clerk.

PRESIDENTS, COLLEGE. See **UNIVERSITIES AND COLLEGES.**

PRINCE EDWARD ISLAND. A Maritime Province of Canada; the smallest province in the Dominion, situated at the mouth of the Gulf of St. Lawrence and separated by Northumberland Strait from the mainland of New Brunswick and Nova Scotia. Area, 2184 square miles; population, according to the census of 1921, 88,615. The capital is Charlottetown, with a population

of 12,347. The chief industries are agriculture, stock raising, fishing, and the breeding of silver foxes. (For particulars of agriculture and live stock, see under CANADA.) The value of pelts marketed and live foxes sold for breeding purposes in 1926 was estimated at \$3,000,000. The total value of fisheries in 1925 was \$1,598,119 as against \$1,201,772 in 1924. The revenue for 1925 was \$740,076 and the expenditure \$745,338. The public debt on Dec. 31, 1925, was \$2,490,200, from which should be subtracted \$1,335,072 standing to the credit of the province at Ottawa. The province is under a lieutenant-governor and a legislative assembly of 30 members, elected for four years, a property qualification being required in the case of one-half the members and the other half being elected by universal man and woman suffrage. Lieutenant-Governor, Frank R. Heartz; Premier and Attorney-General, A. C. Saunders; Secretary-Treasurer, W. M. Lea; Public Works, J. P. McIntyre; Ministers without portfolio, J. Blanchard, D. McDonald, B. W. Le Page, W. B. Butler, J. F. McNeil, and O. S. Inman.

PRINCETON UNIVERSITY. A non-sectarian institution for the higher education of men at Princeton, N. J., founded in 1746. The 1928 autumn enrollment totaled 2453, of whom 2226 were undergraduates and 227 graduate students and fellows. The total endowment in 1927 was \$17,743,840; the total income, \$2,174,712; and the total expenditures, \$2,108,772. The number of volumes in the library was 611,000, exclusive of pamphlets, broadsides, manuscripts, etc. The campaign of the graduate council to secure \$2,000,000 for the increase of faculty salaries was successfully completed before the end of the year, as well as an endowment of \$2,000,000 for scientific research to which \$1,000,000 was to be added by the general education board. The general education board also enabled the departments of art and archaeology and of modern languages to inaugurate special research activities in humanistic studies.

New appointments of the year to the Princeton faculty were those of Hermann Weyl, of Zurich, Switzerland, as T. D. Jones professor of mathematical physics; G. H. Hardy as exchange professor in mathematics from Oxford University; H. L. Lutz, as professor of public finance; P. MacClintock, as Knox Taylor professor of geography; and Augustus Trowbridge, as dean of the graduate school, succeeding Andrew Fleming West, retired. Important gifts to the library of the university included the William A. White copy of the First Folio Shakespeare, the Thomas Rowlandson Collection, and the John Bright Memorial Collection founded by Mrs. Florence Brooks-Aten. The Princeton University Geological Museum also received a valuable addition to its Oligocene Collection in the fossil material, for the study of the mammalian fauna of the Lower Eocene, discovered by the Princeton Scientific Expedition in the Bighorn Basin in Wyoming during the summer.

A university chapel, harmonizing in structure with other recent buildings on the campus, was dedicated on Memorial Day, and later in the year announcement was made of the gift of \$60,000 from Mr. and Mrs. Harvey S. Firestone, of Akron, Ohio, for use in connection with the chapel, including \$10,000 from Mrs. Firestone, to be given at the rate of \$2000 for five years, to further the development of music in the chapel.

On November 15, more than 200 engineers and scientists from various sections of the United States gathered at Princeton for the official dedication of the Engineering Building constructed in the Gothic style, the first independent home of the school of engineering of the university.

Changed conditions in undergraduate life resulted in the amalgamation of the two historic literary societies, the Cliosopich and the American Whig, antedating the American Revolution, into the Whig-Cliosopich Society. Similar changes in student affairs were reflected by the organization of an undergraduate council in place of the former senior council, and the creation of a faculty standing committee to be known as the Council on Undergraduate Life, to include all phases of undergraduate study. Two new scholarships to be known as the Henry Clay Irons Memorial Scholarships, amounting to \$450 each, became available to students in the school of engineering, through their endowment by Henry C. Irons, Jr., class of 1921, and his brother William G. Irons, 2d, class of 1922, of New York, in memory of their father, the late Henry Clay Irons, class of 1889, a construction engineer. President, John Grier Hibben, Ph.D., Litt.D., LL.D.

PROHIBITION. Prohibition again appeared to occupy the major attention of the American public during the year and despite the decisiveness of Governor Smith's defeat in the presidential election there is no question that the subject was still as unsettled as ever when the year closed. Early in the year events began to indicate that Prohibition was to play an important part in the forthcoming national election. Senator Borah, himself no candidate for the Republican nomination, put a series of questions to national Republicans who had indicated their willingness to be their party's standard bearers. These questions included the following: 1. Do you favor a Prohibition plank in the party's platform? 2. What are your enforcement views? 3. Do you favor permitting the States to determine the legal alcoholic content of beverages? 4. Do you favor the repeal of the Eighteenth Amendment or the Volstead Act? Mr. Hoover's views, in the light of his subsequent nomination, are of interest. He said: "I do not favor the repeal of the Eighteenth Amendment. I stand, of course, for the efficient, vigorous, and sincere enforcement of the laws enacted thereunder. Whoever is chosen president has under his oath the solemn duty to pursue this course. Our country has deliberately undertaken a great social and economic experiment, noble in motive and far-reaching in purpose. It must be worked out constructively."

Upon this declaration Secretary Hoover took his stand when he received the Republican nomination. On the other hand, Governor Smith boldly supported modification with a scheme of State control modeled on the Canadian system. In his Milwaukee speech of September 29, the Democratic candidate outlined a programme of the following character: An amendment to the Volstead Act which was to contain a "sensible definition" of an alcoholic beverage. On this basis each State was to fix its own alcoholic content. An amendment to the Eighteenth Amendment

to permit fuller freedom of action for the individual States. A popular referendum on the question of Prohibition. "I would then regard it as the right of the State itself, subject to the limitations which I have outlined, to dispense to its own inhabitants alcoholic beverages as desired by the people of the State."

The issue was thus placed four-square before the American public. As the campaign progressed it became evident that all the Dry forces were supporting Secretary Hoover. The Anti-Saloon League, in public statements, declared that the election of Governor Smith would be a definite blow to the whole theory of Prohibition. Assistant Attorney-General Willebrandt, in addresses before religious groups, called for the defeat of the Democratic candidate because he was a menace to American institutions. Never was the whole subject of Prohibition debated so widely before as a result of Governor Smith's frank recognition of the failure of enforcement.

With the defeat of Governor Smith it was only natural that the Drys should claim the victory as a vindication of all their efforts. F. Scott McBride, of the Anti-Saloon League, C. T. Wilson, of the Board of Temperance, Prohibition, and Public Morals of the Methodist Episcopal Church, and Dr. Ernest A. Cherrington, of the World League Against Alcoholism, all agreed that the repudiation of Governor Smith was a triumph for Prohibition. Mr. Cherrington's statement, for example, said: "The continuance of prosperity, the steady decrease in our death-rate, the drop in our criminal ratio, the disappearance of poverty and the slum, the new moral idealism . . . these are all unanswerable arguments in favor of Prohibition." It was generally conceded, however, that the election of a Republican administration would allow an opportunity for the complete testing of what Mr. Hoover had called "a noble experiment." The events of the next four years would permit the American people to see if Prohibition could really be enforced.

OTHER ELECTION RESULTS. In an unofficial referendum in Massachusetts, the Wet forces won an overwhelming victory when the voters in 36 of the State's 40 senatorial districts voted, 697,735 against 414,512, for the repeal of the Eighteenth Amendment. Thirty-four districts were carried by the Wets.

On November 14, the voters of New Zealand, in the regular triennial parliamentary election, expressed their desire for the continuance of the licensing system. The majority was in the neighborhood of 200,000. The electorate was called to indicate its preference among the following: 1. National continuance of the liquor trade or licensing. 2. State purchase and control of the trade. 3. National Prohibition.

ENFORCEMENT APPROPRIATIONS. For the fiscal year beginning July 1, 1923, the United States Congress in February voted an appropriation of \$13,000,000 for the Prohibition Bureau and \$28,640,000 for the Coast Guard, of which at least \$15,000,000 was to be used to fight rum-running. The debate attending the passage of the appropriation measure was very spirited in view of the fact that the Wets insisted upon an appropriation of \$75,000,000 as well as the restriction of the release of alcohol for industrial purposes. This was in line with their attitude that Prohibition could have a complete test only if every possible measure was taken toward enforcement. The

same situation developed in the short session in December when the Congress came to debate the Treasury Department appropriation bill, for the fiscal year beginning July, 1, 1929. Prohibition Commissioner Doran, though he asked for only \$13,500,000 for his bureau, confessed that it would cost the country \$30,000,000 annually if the nation was to be effectively policed. Both he and Admiral Billard, of the Coast Guard, were satisfied with the success of the war against the rum-runners. To them, serious sources of supply were European ports, the French Island of St. Pierre, and particularly Canada. On the other hand, the domestic production of alcohol and liquor was well in hand, and this had particular reference to the illegal diversion of industrial alcohol. The chief source of domestic supply was the illicit manufacture of spirits from grain and sugar.

The Wets, in debating the appropriation measures, attempted their usual tactics. They sought to have passed enormous supply bills and, in fact, the Senate passed Senator Bruce's measure to give the Prohibition Bureau \$270,627,384 for its work. This was done by the majority to forestall a lengthy debate on the subject that was threatening, for it was obvious that the conference committee of the two houses would not permit the figure to stand. The conference report, which was passed in the Senate by a narrow majority of three votes and in the House without a recorded vote, called for the expenditure of \$13,500,000 on the work of the Prohibition Bureau and \$14,686,000 for the Coast Guard to be devoted to enforcement work.

WORK OF THE PROHIBITION BUREAU. Dr. Doran's report of the work of his office for the fiscal year ending June 30, 1928, was released early in December. It showed that Prohibition agents had made 75,307 arrests and gained 58,813 convictions, an increase of 10,000 arrests over the previous year. Operating with 4396 permanent, and 92 temporary, employees, the Bureau had seized 1,048,636 gallons of illegal spirits, 4,254,029 gallons of malt liquors, 396,603 gallons of wine, 16,220 illicit distilleries, 18,980 stills, and 217,278 fermenters. During the year, 169,000,000 gallons of alcohol were manufactured, 92,000,000 gallons of denatured alcohol, and 159,000,000 gallons were withdrawn for denaturing. Distilled spirits withdrawn from warehouses on which taxes were paid amounted to 1,613,534 gallons, leaving in bond approximately 20,000,000 gallons of such spirits (though the figure was actually half that amount because of evaporation).

WORK OF THE COAST GUARD. Admiral Billard's report for the fiscal year ending June 30, 1928, showed that his unit boarded and examined 65,710 vessels and of these, 1554 were seized or reported for violations of the law. It was declared that, "The law-enforcement work of the Coast Guard relative to the prevention of the smuggling of liquor into the United States from the sea has been prosecuted with very satisfactory results. This illicit traffic has been tremendously reduced and rum row has been eliminated."

WORK OF THE DEPARTMENT OF JUSTICE. The report of the Assistant Attorney-General, Mrs. Mabel W. Willebrandt, in charge of the Division of Prohibition of this Department, showed that for the fiscal year 1928 her division had instituted 55,729 criminal prosecutions, an increase of 15,020 over the preceding year. Of the 58,429 cases that were terminated during the year, 48,-

820 resulted in convictions. Jail and prison sentences imposed totaled more than 7700 years while the total amount of fines collected was \$7,303,563. As a result of the use of the padlock, the number of permanent injunctions obtained was 3999, which was an increase of 586 over the preceding year.

As a result of the activities of the customs officials and the Coast Guard, progress was made in checking the importation of illicit liquor by domestic ships. During the fiscal year, 370 domestic craft were seized as compared with 320 in 1927. In 1928 almost half the seized craft were in Florida waters. Foreign craft seized totaled 22, while 28 ships were forfeited during the year. It may be noted that, in 1925, 35 foreign ships were seized, while only 10 forfeitures were made. Smuggling from Canada was regarded as a still unsolved problem. In view of the fact that a large part of the liquor smuggled in from Canada was cleared through the regular Canadian customs, it was possible to obtain an approximate idea of the size of this traffic. The figures that follow indicate the size of this traffic (in whisky only) over a period of years.

EXPORTS OF WHISKY FROM CANADA TO UNITED STATES

	<i>Amount in Gallons</i>	<i>Canadian Value</i>
1925	665,896	\$10,772,988
1926	988,152	15,475,270
1927	1,053,213	17,171,484
1928	1,169,002	18,883,541

LIQUOR-SHIP SEIZURES. The action of the British Government during the year indicated increasing dissatisfaction with the zeal displayed by the Coast Guard in stopping British ships. In April the British Ambassador delivered a note to the State Department in which he pointed out specific violations of the so-called Bahaman agreement on the part of American Prohibition forces. The differences between the two governments included territorial limits, legal jurisdiction, etc. The Bahaman agreement, arrived at on Mar. 27, 1926, was in effect a gentleman's understanding and did not bind either party legally and was to be subject to withdrawal if it did not work. The agreement was to permit "specified United States revenue cutters to enter British territorial waters at Gun Cay and the islands contiguous thereto without strict compliance with Admiralty regulations governing the visits of foreign armed vessels to British overseas ports." But "the only formality which his Majesty's Government desires to see observed in this connection is that the cutters in question shall first call at Bimini to inform the Bahamas Commissioner of their intention."

The British note pointed out specific violations of this part of the agreement and enumerated the cases of three rum chasers that had entered Bahaman waters without first indicating their intentions to the authorities. The fact is, the note of the British Government was not the first evidence of dissatisfaction. It followed a long interchange of correspondence and conferences among British officials, Coast Guard authorities, and State and Treasury Department officials bearing on this same point, i. e., the seizure of British vessels.

U. S. SUPREME COURT. In May, the U. S. Supreme Court, by a divided bench of five to four, declared wire-tapping legal when done by Pro-

hibition agents when in the performance of their duties. The case revolved about the conviction of a large group of bootleggers in the State of Washington against whom successful evidence was obtained through tapped wires. It is interesting to note that a State statute forbade such practices. The appeal taken to the Supreme Court was based on the Fourth and Fifth Amendments of the Constitution guaranteeing individuals the right of security against unreasonable search. Chief Justice Taft wrote the majority decision in which he said: "The language of the amendment cannot be extended and expanded to include telephone wires reaching to the whole world from the defendant's office . . . A standard which would forbid the reception of evidence if obtained by other than nice ethical conduct by government officials would make society suffer and give criminals greater immunity than has been known heretofore." Justices Brandeis, Holmes, Butler, and Stone dissented. Mr. Justice Holmes expressed the minority opinion when he called wire-tapping a "dirty business." He went on: "We have to choose, and for my part I think it is a lesser evil that some criminals should escape than that the Government should play an ignoble part." Mr. Justice Brandeis in his dissent said: "The duty of the Federal courts to see that the law is not violated precludes evidence secured by a conspiracy in which the United States is engaged." Justices Stone and Butler also wrote dissenting opinions. In April, the Supreme Court, in a decision written by Mr. Justice Sutherland found the use of the padlock legal, declaring: "It is no answer to the suit to say that the owner did not participate in the criminal act." It was generally agreed that the padlocking of premises for a six-month period, where liquor violations had been committed, would render great aid in the fight on bootlegging.

NEW YORK. In September, an acrimonious debate took place between Mayor Walker, of New York, and Assistant Attorney-General Willebrandt as a result of the charge of the latter that the administration was making no efforts to arrest and prosecute owners of speakeasies. Mayor Walker easily won first honors when he pointed out that since the beginning of his administration on Jan. 1, 1926, the police in the precinct in which night clubs were located had filed complaints with the Department of Justice and submitted evidence of violations of the Prohibition law in 1593 cases. In only 22 of these cases did the Department of Justice obtain injunctions. In the autumn Mrs. Willebrandt seemed to take a particular interest in New York and sent a special Federal attorney to prosecute Prohibition cases. It was generally conceded that the move was political for the effort was not long sustained. The medical examiner's figures for deaths from alcoholism in New York showed that, up to September, 1518 deaths had been due to this cause. The medical examiner's office attributed these deaths largely to the Government's policy of poisoning commercial alcohol to make it unfit for beverage purposes. In 1927, alcoholism was the cause of 719 deaths as compared with 87 deaths in 1918, 95 in 1919, and 84 in 1920 (the year of the passage of the Eighteenth Amendment).

FIGHT ON AMENDMENT. The Association Against the Prohibition Amendment took steps during the year to expand its programme, the most important move being the appointment of

Henry H. Curran, of New York, as its president and general director. In May the Association indicated the new scope of its activities by announcing the addition of 21 new board members and passing resolutions favoring the modification of enforcement acts in the individual States and the creation of State agencies for the distribution and sale of liquor on the Canadian model. Pierre S. du Pont continued as chairman of the executive committee. On December 31, the association made public its plans for the year 1929. It declared its intention to spend \$100,000 in an elaborate investigation into the effects of Prohibition, not only in the United States, but in England, France, Italy, Norway, Denmark, Belgium, and Finland. The study was to include the financial and economic aspects of Prohibition, as well as its psychological, political, and social sides.

STATISTICS. In its fourth annual survey, the Moderation League indicated its conviction that drunkenness has increased to the pre-Prohibition level; that drunkenness among the young is "far above anything ever known in this country"; that conditions in the dry States are much worse than in the wet States; and that arrests for drunkenness per capita in New York City are "much less than in the other large cities of the nation." The report for the year was based on information received from police departments of 584 places, in which arrests for drunkenness increased from 164,125 in 1924 to 707,104 in 1927. In the 388 places for which figures were available from 1914 to 1927, the report states that arrests for drunkenness were higher in 1927 than in any pre-war year except the boom year of 1916. The 1916 peak was 559,364 arrests and the 1927 figure was 557,369.

With regard to conditions in the so-called dry States, the report declares that they were very much worse in 1927 than they were in 1914.

In the places reporting from dry States, there were 106,072 arrests for drunkenness in 1914; 59,941 in 1919; and a new high level of 184,327 in 1927. . . . One of the interesting things disclosed by the survey is that while the low point of drunkenness in the former wet States was reached in 1920, the first year of the Eighteenth Amendment, yet in the former dry States—States which had some kind of a State-wide dry law before the Amendment was passed—the low point of drunkenness was in 1919 before National Prohibition. In other words, in the dry States the increase in drunkenness had already begun in the first year of National Prohibition.

DURANT PRIZE. William C. Durant, automobile manufacturer, made public in September an offer of \$25,000 for the best plan for Prohibition enforcement. On December 26, Major Chester C. Mills, formerly Federal Prohibition Administrator for the New York District, was announced the winner. Malcolm D. Almack, of the Palo Alto (Calif.) High School, was announced the winner of the \$5000 school prize. Mr. Mills's plan for enforcement was concerned largely with the checking of the diversion of industrial alcohols for the illicit manufacture of intoxicating beverages. He divided his proposal under four heads. 1. With regard to the issuance of permits—The Government should make every effort to ascertain the purposes for which industrial alcohols are being used. The Government should even have resources for supervising the manufacture of the articles for which permits have been granted. The issuance of permits should be placed in the hands of the local administrator. 2. With regard to enforcement—The Coast Guard has

been successful in checking the importation of foreign liquors and should be continued. As for controlling the manufacture of domestic liquors, in each case this is a local problem and should be treated as such. Each district should be watched and analyzed to determine consumption and sources of supply. 3. As for the political aspects—The supervision of the enforcement machinery must be taken out of politics. 4. A detailed method for controlling the diversion of industrial alcohol—The independent denaturing plant has no place in the industrial scheme and it should be eliminated. It purchases its alcohols from licensed distilleries and since it cannot compete for legitimate business it is often compelled to sell its goods to bootleggers.

The leading form of diversion is under the cover of permits allowing firms to manufacture articles from specially denatured alcohol. To control these, Mr. Mills suggested the following: "I believe that strict supervision of the manufacturing activities of these permit holders and the requirement that they notify the local administrator in sufficient time to enable him to supervise the manufacture will practically eliminate their opportunities to divert specially denatured alcohol to the bootlegger." It is interesting to note that in the contest, 23,230 plans were submitted. Some of the proposals were fantastical and called for the use of the Army and Navy, the employ of a Prohibition dictator, and capital punishment as the penalty for the sale of intoxicating beverages. Some 1500 persons urged that the Government manufacture and sell intoxicants; better foreign cooperation was urged by 1392 persons; there were 19,108 recommendations for education and propaganda, etc., etc. The prize award committee consisted of the following:

Chairman, W. O. Thompson, president emeritus, Ohio State University; William H. Allen, Jane Addams, Senator William E. Borah, Bruce Barton, George Gordon Battle, Dr. S. Parkes Cadman, Senator Carter Glass, Maj. Gen. Harbord, William G. McAdoo, Robert L. Owen, Owen Roberts, Elmer Schlessinger, G. P. Whaley, and Dr. Stephen S. Wise.

The Prohibition authorities at once threw cold water on the whole project. They indicated their belief that Prohibition enforcement did not depend upon the shutting off of a single source of supply; that as soon as one door was closed another one was immediately opened. They indicated that Mr. Mills was wrong in saying that the source of the evil was the diversion of industrial alcohols, that in fact the chief trouble at the present time was the manufacture of "wildcat" alcohol. The New York *World* pointed out very illuminatingly: "And certainly the Prohibition service knows by this time that the more success it achieves in shutting off diversion of industrial alcohol and in shutting off rum-running from Canada and Europe, the more promptly it will encourage the manufacture of alcohol in a million wildcat stills, which will make the problem of enforcement more complex than ever." It is questionable whether Prohibition enforcement was very far advanced at the end of the year 1928.

DEBATE. Additions to the literature of Prohibition were voluminous. Prof. Irving Fisher was responsible for a third volume replete with statistics of a rather doubtful character, to prove that poverty was gone, our morals were better, etc., and all because of Prohibition. Prof. Ray-

mond Pearl wrote an interesting study on the psychology of Prohibition in the December *Mercury* when, by an examination of the figures of alcoholic beverage consumption, he showed that while the areas under State-wide prohibitory laws were increasing, the American public was drinking more and more. For example, in 1870 the consumption per capita was 7.7 gallons while in 1917 it was 20 gallons. On the other hand, in 1870, 3.08 per cent of the American population was living under State-wide prohibition laws while in 1917, 35.27 per cent were so living. His conclusion is: "The fundamental element of American societal psychology regarding Prohibition is that the people want both a prohibitory law and liquor too."

Mr. Henry F. Pringle had an interesting article in the November *Harper's* called, "Vice and the Volstead Act." Prof. Lee McBain published *Prohibition, Legal and Illegal* in which he pointed out that there was no immediate prospect for the repeal or modification of the Eighteenth Amendment. The most that might be hoped for was the legislative or administrative failure of the enforcement machinery. He devoted a necessary chapter to the prevalent loose talk about States' rights in which he neatly dismissed the subject with the following: "There is nothing sacrosanct about States' rights. The States derive their rights neither from nature nor from God. The liberty of the States is, like the liberty of the individual, wholly a question of political expediency." Governor Smith's frank discussion of the failure of enforcement was responsible for considerable space being devoted to the Canadian and Swedish systems. Among the articles of note may be mentioned those appearing in the New York *Times* of September 2, 9, and October 14 and the New York *Tribune* of September 16 and November 18. The *Current History* for July, August, September, and October contained a number of articles of greater or less merit on the question of enforcement and the moral effects of Prohibition. See ANTI-SALOON LEAGUE; WOMEN'S CHRISTIAN TEMPERANCE UNION; UNITED STATES.

PROTESTANT EPISCOPAL CHURCH. A religious denomination representing the Anglican communion in the United States, of which the Church of England is the parent church, and which was brought to America with the Jamestown colonists in 1607. The first American service from its Book of Common Prayer, however, was held in the year 1579, on the first Sunday after Trinity, on the Pacific coast near the present site of San Francisco, when the Rev. Francis Fletcher, chaplain of the fleet under command of Sir Francis Drake, conducted service, preached a sermon, and celebrated Holy Communion. The Virginia colony was permanently established with regular ministrations of the Church in 1607, and, despite the absence of a colonial episcopate, the Church, under English clergymen, maintained a firm foothold for 170 years. In 1785, the first American bishop was consecrated in Scotland, and three years later two more were consecrated. The Church completed its organization at a convention in Philadelphia in October, 1789, at which the constitution and name were adopted, and a Book of Common Prayer was set forth. The Episcopal Church maintains active missionary enterprises in Japan, China, Liberia, Mexico, the Philippines, Alaska, Hawaii, Brazil, the Canal Zone, Cuba, Porto Rico, Haiti, the Dominican Republic, the Virgin Islands, and Palestine, and is

represented by establishments in 10 important European centres. Its domestic missionary activities include work among the foreign-born, American Indians, Negroes, mountaineers, in mill communities, and a wide range of social service. Five colleges and many educational institutions represent the interest of the Church in this field.

The government of the Church centres in a General Convention which meets triennially. The affairs of the Church between sessions are conducted by a National Council made up of 16 representatives elected by the General Convention, of whom four are bishops, four priests, and eight laymen, supplemented by eight others named by the eight provincial synods. This Council conducts its work with the aid of three major departments, missions, religious education, social service, and three others, finance, publicity, and field. The Council is also the Board of Directors of the Domestic and Foreign Missionary Society, conducted through the Department of Missions and Church Extension. The presiding bishop of the Church, elected by the General Convention, is also president of the National Council. The whole work of the Church is incorporated in a general church programme adopted triennially.

Operating on a balanced budget, the Church, in 1927, reported total expenditures amounting to \$3,593,089. Of this sum, the total expenditure for missions, domestic and foreign, was \$2,819,074, divided in practically even amounts between the domestic and foreign fields. The number of missionaries supported in whole or in part by appropriations through the Department of Missions during the year 1927 was as follows: American missionaries abroad, 189 men and 245 women; native staff abroad, 1266 men, 621 women; American missionaries in the United States, 526 men, 117 women; native staff in the United States, 101 men, 2 women, making a total of 3067 persons. During the year 47 new missionaries were appointed.

In 1928 there were reported 6237 clergy, an increase of 30 over the preceding year. The total number of communicants was 1,241,828, an increase of 22,887 over the preceding year. The total contributions to all causes within the Church were \$45,928,056, an increase of \$1,184,213 over the preceding year. There were 6000 Church schools with 487,505 pupils, under the direction of 58,477 Sunday-school teachers. The fifteen theological seminaries of the Church reported an increase of 9 in the number of candidates for the ministry.

The National Council is assisted in its work by a group of co-operating agencies. The Woman's Auxiliary, through its triennial thank offering, inaugurated in 1889, contributed in 1928 for the years 1925-28, the sum of \$1,101,450.40, as compared with \$912,841 in the preceding triennium. Other co-operating agencies of the Church are the Brotherhood of St. Andrew, for men; the Daughters of the King; the Guild of St. Barnabas, for nurses; the Churchwomen's League for Patriotic Service; the Knights of St. Paul, the Knights of St. John, the Knights of Washington, and the Order of Sir Galahad, for boys; the Girls' Friendly Society in America, for girls and young women; and the Young People's Fellowship, for young people in general. The Church Mission of Help is notable among affiliated organizations dealing with a wide range of Church interest and activity. The Church publishes *The Spirit of Missions*, *The Church at Work*, *Findings in Re-*

ligious Education, and *Bulletins* of the National Council, together with material dealing particularly with each department of the National Council. Six independently owned publications make an important contribution to the life of the Church; they are *The Living Church*, *The Churchman*, *The Witness*, *The Southern Churchman*, all weeklies; *The American Church Monthly*, and *The Chronicle*, monthlies. In addition, there are 80 monthly diocesan publications in the home field and a score of others in the mission field.

The General Convention of the Church held its triennial meeting in Washington, D. C., in October, 1928. The most important work before the Convention was the completion of the Prayer-Book revision begun in 1913. It also continued the Commission on Faith and Order and appointed a new commission to confer with Methodist and Presbyterian groups in the interest of church unity. A maintenance budget amounting to \$4,224,670 a year was adopted to carry on the world-wide work of the church during the triennium in progress and plans for raising \$3,000,000 for advance work were made. The Convention gave consideration to such vital topics as marriage and divorce, rural work, labor and industry, world peace, and young people in the Church, and took appropriate action. In connection with the Convention there was held an Institute of Religion in which about 3000 persons registered for study classes. The next session of the Convention was scheduled for September, 1931, in Denver, Colorado.

The year 1928 was marked by the death of seven bishops of the Church: The Rt. Rev. Ethelbert Talbot, D.D., Bishop of Bethlehem, the oldest prelate of the entire Anglican Communion, and sometime presiding bishop, who was succeeded by his coadjutor, the Rt. Rev. Frank William Sterrett, D.D.; the Rt. Rev. Henry B. Delany, D.D., Suffragan Bishop of North Carolina; the Rt. Rev. Charles M. Beckwith, of Alabama, who was succeeded by his coadjutor, the Rt. Rev. William G. McDowell, D.D.; the Rt. Rev. Joseph H. Johnson, D.D., of Los Angeles, who was succeeded by his coadjutor, the Rt. Rev. W. B. Stevens, D.D.; the Rt. Rev. William A. Guerrey, D.D., of South Carolina; the Rt. Rev. George A. Kinsolving, D.D., of Texas, who was succeeded by his coadjutor, the Rt. Rev. C. S. Quin; and the Rt. Rev. John Le Mothe, D.D., of Honolulu. The General Convention meeting in Washington in October elected the following priests to vacant Missionary Sees: The Rev. Norman S. Binstead, as Bishop of Tohoku; the Rev. Thomas Jenkins, D.D., for Nevada; and the Rev. George H. Thomas, for Wyoming, who, however, declined the election. During the year, also, the Rev. Albert S. Thomas was elected Bishop of South Carolina, the Rev. J. I. B. Larned, Suffragan Bishop of Long Island, and the Rev. Frank E. Wilson, first Bishop of the newly created diocese of Eau Claire. The headquarters of the National Council are in the Church Missions House, 281 Fourth Avenue, New York City.

PROTOGEROFF, ALEXANDER. Macedonian autonomist leader, assassinated at Sofia, Bulgaria, July 7. He was the head of the movement for the independence of Macedonia, and held almost unlimited power in Macedonian circles and an influential but unofficial position in Bulgaria. It was asserted that he was killed by opponents who desired to renew action against Jugo-Slavia, or perhaps in revenge for one or another of

numerous political murders laid at the door of Protogeroff. He was a Bulgarian general in the World War, when that country was allied with Germany, Austria-Hungary, and Turkey, and after the armistice he placed himself at the head of the radical Macedonian autonomist movement. After the War, Jugo-Slavia demanded his extradition from Bulgaria, charging him with brutality and sedition during the Bulgarian occupation of eastern Serbia, but the Government at Sofia refused to accede to the demand.

PRUSSIA, prűsh'a. A constituent republic of the German Republic; a kingdom of the German Empire until the October Revolution of 1918; proclaimed a republic Nov. 13, 1918. Capital, Berlin. Area, Apr. 1, 1925, 112,625 square miles, as compared with 135,134 square miles before the War; population, according to the census of 1925, 38,120,173, as compared with 40,165,219 in 1910. The later figures for area and population are exclusive of the Saar district, Eupen and Malmedy, and the territory of Upper Silesia which was ceded to Poland; showing a loss to Prussia, as a result of the Treaty of Versailles, of 21,645 square miles and a population of 4,601,626. The movement of population in 1926 was: Births, 780,621; deaths, 472,334; marriages, 300,804. The chief cities with their populations in 1925, according to the census of that year, are Berlin, 4,024,165; Cologne, 700,222; Breslau, 557,139; Essen, 470,524; Frankfort-on-Main, 467,520; Düsseldorf, 432,633; and Hanover, 422,745.

The area under the principal crops and the yield in metric tons for 1926 were as follows: Wheat, 2,322,594 acres, 1,620,258 tons; rye, 8,918,003 acres, 4,937,677 tons; barley, 1,940,571 acres 1,387,851 tons; oats, 5,813,652 acres, 4,434,431 tons; potatoes, 4,533,390 acres, 21,579,018 tons; hay, 6,928,344 acres, 11,356,573 tons.

In 1926 vineyards had an acreage of 39,639 with a yield of 4,023,282 gallons of wine valued at 17,771,969 marks. On Dec. 1, 1926, the livestock included: Cattle, 9,604,891; sheep, 2,724,678; swine, 13,238,163; goats, 2,033,255; horses, 2,670,942; and poultry, 47,210,127. The chief minerals are coal, lignite, iron ore, and salt. The railway mileage, which has been taken over by the Federal Government, is about 20,000. The revenue and expenditure for 1927-28 balanced at 3,645,030,959 marks. The Government is under a Diet and a State Council, the members of the former being elected for four years by secret and direct ballot on the basis of proportional representation. The latter is elected by the provincial assemblies on the basis of one for every 50,000 inhabitants. The executive, which exercises the functions of the former king, is vested in the ministry, which is appointed by the Prime Minister elected by the Diet. As a result of the elections of Dec. 7, 1924, the following parties were returned: Social Democrats, 114; Centre (Catholics), 81; German National party, 109; National Socialists, 11; German People's party, 45; Democrats, 27; Communists, 44; Economic party, 11; German Hanoverians, 6; and Polish party, 2; total 450. The Prime Minister in 1923 was Otto Braun (Socialist, appointed Apr. 4, 1925).

PSYCHIATRY AND CRIME. See CRIME.

PSYCHICAL RESEARCH. The minority which in various countries was interested in the investigation of this field continued to be divided in various ways. First into those who make it a religion (Spiritualists) and, second; those to

whom it is a scientific inquiry (Psychical Researchers), though of course the classes shade into each other. The former, once numerous in the United States, had become very much reduced in numbers, while in England, where the cult did not so much flourish, of late years it was on the increase. The great majority of scholarly men and women (comparatively few in number) who have devoted much time and attention to Psychical Research have become convinced of, or impressed by, one or several claimed types of the "supernormal." But these, again, are divided, roughly speaking, into two groups—those who accept one or more types of mental phenomena only (such as telepathy, premonitions, clairvoyance, psychometry, and facts supernaturally derived by mediumship, whether through telepathy or discarnate intelligences), and those who, while generally acceding to one or more types of these, are also convinced of the genuineness of one or more species of physical phenomena (such as telekinesis, levitation, spirit photography, ectoplasm, and the materialization of spirit forms). These cross-divided groups (the Spiritualists almost universally accepting physical phenomena) in turn shade into each other, as when a man convinced of several mental species, accepts no physical one more than tentatively.

Those of America and England who accept physical phenomena are more generally disposed to credit the bulk of them to spirits, while savants on the Continent of Europe as a rule attribute them to freakish biological processes and little-understood physical forces. Particularly in Germany, where Baron von Schrenck-Notzing and other defenders of disputed physical cases had their organ, the *Zeitschrift für Parapsychologie*, the war was going on, though less merrily since Count von Klinckowstroem and other skeptics had lost theirs, the *Zeitschrift für Kritischen Okkultismus*, which died during the year for lack of an "angel." The champions of the physical mediums find it hard to explain the skeptics except on the assumption that these have hard hearts and a penchant for exposing. The skeptics usually hold that the convinced mean well but are little acquainted with the possibilities of conjuring and are the victims of sensory illusion.

Dr. Rosenbusch and others claimed to have caught Eleonora Zugun in fraud, and Countess Wassilko and Prince came to her defense. Vinton and Schrenck-Notzing crossed swords over the Schneider Brothers. Prince reported unfavorably on Rudi Schneider, Frau Silbert, and Guzik. To the support of the first came Dr. Gerda Walther and, in a moderate degree, R. Lambert; to that of the second rallied Dr. Tischner and Prof. Walter. The medium, Kraus, confessed that he hoodwinked the Baron and the latter declared that the confession was false. The detailed confession of Munnings in London was similarly confronted. In America, out of the four official commissions, embracing 19 persons, which investigated the "Margery" case, 17 persons stand opposed, but J. M. Bird still continued to publish a quantity of literature in defense, and she had many followers.

In the field of mental phenomena, which require no "conditions" hampering experiment, and where investigation is more a matter of trained common sense, the waters continued comparatively calm. Skeptics abound, but none were found ready to attempt the task of explaining

away any of the great stenographically-reported and critically-analyzed cases. Yet even newspaper leaders foster the legend that Houdini, the genial magician, was an authority in this field and could duplicate anything which the best of psychics have done under scientific auspices.

Among the leading organizations concerned with psychical research of a more or less scientific character, there may be listed in random order: The Society for Psychical Research (London), the Boston Society for Psychic Research (Boston), the American Society for Psychical Research (New York), the British College of Psychic Science (London), the National Laboratory of Psychical Research (London), the Institut Métapsychique International (Paris). All of these issue publications. Probably the best organ of the Spiritualistic religious cult abroad is *Light* (London), and possibly the best in the United States is *The National Spiritualist*.

BIBLIOGRAPHY. Among the more notable of recent books, some for one reason, some for quite another, and not all of equal critical value, are the following:

Life Beyond Death, by C. Dayton Thomas; *The Bridge*, by Nea Walker; *Leonard and Soule Experiments*, by Lydia W. Allison; *Notre Sixieme Sens*, by Charles Richet; *How to Go to a Medium*, by E. J. Dingwall; *Noted Witnesses for Psychic Occurrences*, by Walter Franklin Prince; *The Either-Or of Spiritualism*, by Mrs. St. Clair Stobart; *Chinese Ghouls and Goblins*, by G. Wiloughby-Meade; *Psychical Science and Religious Belief*, by J. Arthur Hill; *The Scripts of Cleophas*, by Geraldine Cummins; *The Great Problem*, by George Lindsay Johnson.

PSYCHOANALYSIS. A most active controversy continued within the field of psychoanalysis concerning the status of lay analysis. Freud's belief was that in the majority of cases the physician's help and medical knowledge are unnecessary; that psychoanalysis is not a particular branch of medicine but a part of general psychology. The question still under discussion by members of the International Psychoanalytical Association was whether the association could officially approve and train non-medical analysts to work under medical supervision and consultation after previous medical diagnosis of the patient's symptoms. A draft of rules for training in psychoanalysis had been prepared and circulated for criticism by the International Training Commission.

The status of the psychoanalytic movement in America was thus described by C. P. Obendorf (*The International Journal of Psychoanalysis*, 1928, vol. ix, p. 275):

From my acquaintance with the psychoanalytic movement in other countries, it is safe to say that nowhere has the interest in psychoanalysis been so diffuse and at the same time so superficial and confused as in the United States. During the past year, the tendency to cloud the perplexed public mind has been decidedly increased by the considerable publicity which attended the visits of several European analysts, including Ferenczi, Rank and Adler to this country. Moreover, the charlatans, who have always followed on the trail of very great movement in science, have not been slow to utilize Freud's position in regard to lay analysts, to excuse their totally inadequate preparation of any kind.

On the other hand, the psychoanalytic teachings in regard to the necessity for more minute and penetrating anamneses, the influence of sexual impulses, and the conflicts engendered between instinctive trends and cultural demands, have been adopted by lecturers on

social topics and child guidance so that these psychoanalytic positions have become commonplaces in our social thought and discussions.

During the year the New York Psychoanalytic Society arranged an introductory course of lectures on psychoanalysis which were attended by eighteen physicians who had had previous training in neurology or psychiatry.

Among the important books published during the year are *Contributions to Analytical Psychology*, by C. G. Jung, being the second English collection of the author's essays; and *Index Psychoanalyticus*, 1893-1926, by J. Rickman, honorary secretary of the Institute of Psychoanalysis, London. The latter work contains about 10,000 references to English, German, French, Dutch, Hungarian, Italian, Polish, Russian, Spanish, Swedish, and Portuguese books and papers, classified according to author. The index is considered to be of exceedingly great value to all workers in psychoanalysis. *Psychoanalysis for all*, by R. Urbantschitsch (translated by A. Eiloart), is a book intended to give a peep behind the scenes and gives a fairly satisfactory account of the psychoanalytic process. *Symbolism: Its Meaning and Effect*, by A. N. Whitehead, was published by the Cambridge University Press.

PSYCHOLOGY. NOTES AND NEWS. The thirty-seventh annual meeting of the American Psychological Association was held at Columbia University on Dec. 27-29, 1928, in conjunction with the eighty-fifth annual meeting of the American Association for the Advancement of Science. This was the largest meeting in the history of the American Psychological Association with a registration of 537 members. The presidential address was delivered at the close of the annual banquet at the Hotel Pennsylvania, by Prof. Edwin G. Boring, of Harvard University. At the business meeting held on the evening of December 27, Prof. K. S. Lashley, of the Institute for Juvenile Research, Chicago, was elected president for 1929. It was decided to merge the 1929 Association meeting with the International Congress of Psychologists which was to meet in September of that year. (See below.) Fewer papers were read than at previous meetings, in order that time might be available for profitable discussion. Round-table discussions were held on: The First Course in Psychology, Personality, Consciousness and Behavior, Psychophysical Measurement Methods, and Psychology of Aesthetics. The first of these discussions was of particular interest because the nature of the first course in psychology has been the subject of much criticism in recent years. There was a sharp difference of opinion as to whether the course should be preparatory to more advanced courses in psychology, or whether it should prepare the student to meet his life's problems. It was recognized that one single course could scarcely do both. There were 12 papers read on Experimental Psychology, 10 on Animal Psychology, five on each of the following: General Psychology, Psychology of Emotions, Child Psychology, Mental Tests and Measurements, and Abnormal Psychology. There were four papers on Educational Psychology. At two sessions for Informal Reports of Graduate Students, there were 19 papers read.

A special seminar was conducted at the Columbia University Summer Session of 1928 for the discussion of "The First Course in Psychology." Special fellowships were awarded to

nine persons in various universities who represented various points of view. It was planned to repeat the seminar in the Summer Session of 1929. The results of the discussion were to be published later. The project was directed by Prof. R. M. Elliott, of the University of Minnesota.

The Congress International de Psychologie appliquée announced a meeting of the Congress in Paris, March 21-27, 1929, postponed from October, 1928.

The Fifth International Congress of Psychotechnics was held at Utrecht, September 10 to 14, 1928. The recognized languages were French, German, and English. The problems of character and temperament occupied a prominent place on the programme. The proceedings of the Fourth Congress held at Paris, 1927, was published and could be procured from M. J. M. Lahy, Secretary General, 22 Avenue de l'Observatoire, Paris (14), E.

The Sixth Annual Meeting of the Council for the Education of Exceptional Children was held in Toronto, Canada, February 23 to 25, 1928. Special classes in the schools for various kinds of defectives were open for inspection, and addresses and papers were delivered on many topics concerning the special problems involved in the teaching of defectives.

The National Conference on Character Education in Schools was held at Teachers College, Columbia University, on Mar. 2 and 3, 1928. The proceedings revealed a wide and serious interest in character education among those who deal with youth in school, church, welfare organizations, and the home.

A conference on Experimental Psychology was held at Carlisle, Pennsylvania, on Mar. 30 and 31, 1928, under the auspices of the Division of Anthropology and Psychology of the National Research Council. The state of laboratory psychology was discussed and recommendations made for a committee on Experimental Psychology to obtain and administer funds for the promotion of research.

Arrangements were completed for the Ninth International Congress of Psychology, to be held at Yale University, New Haven, Connecticut, Sept. 1 to 7, 1929. This was to be the first meeting of the Congress in America, previous meetings having been held in Paris, 1889, London, 1892, Munich, 1896, Paris, 1900, Rome, 1905, Geneva, 1909, Oxford, 1923, and Groningen, 1926. The President of the Congress was James McK. Cattell, of New York City; Secretary, Edwin G. Boring, Harvard University.

Plans were made for a psychological study of the Australian aborigines, under the auspices of the Australian Research Council. Dr. S. D. Porteus, Director of the Psychological Clinic of the University of Hawaii, was invited to initiate the work.

Dr. Madison Bentley, of the University of Illinois, was appointed Sage Professor of Psychology at Cornell University to occupy the chair held for nearly 35 years by the late E. B. Titchener.

Bird T. Baldwin, Research Professor of Educational Psychology and Director of the Iowa Child Welfare Research Station at the University of Iowa, died May 12, 1928.

The completion of 35 years of service in teaching and research in psychology by Professor Margaret F. Washburn, of Vassar College, was commemorated by the publication of a volume of

studies by her friends and students. The work appeared as a special volume of the *American Journal of Psychology*, of which Professor Washburn had been an editor for a number of years. The book contains 32 articles on theoretical and experimental topics, together with a bibliography of the writings of Professor Washburn.

Dr. George M. Stratton, Professor of Psychology at the University of California, and Dr. Lewis M. Terman, Professor of Psychology at Stanford University, were elected to membership in the National Academy of Sciences. Prof. Wolfgang Koehler, of the University of Berlin, and Prof. Karl Pearson, of the University of London, were elected foreign honorary members.

GENERAL AND THEORETICAL PSYCHOLOGY. One of the questions of most general interest during 1928 has been that concerning the nature of mental organization. The view of Prof. Charles Spearman, University of London, that mental organization is comprised of one or more general factors and a number of specific factors, and the opposing one of Prof. E. L. Thorndike, of Columbia University, that specific factors are adequate without the assumption of general factors have generated much theoretical discussion and a number of experimental attacks upon the problem. (See C. L. Hull, "Aptitude Testing," also S. C. Dodd, "The Theory of Factors," *Psychol. Review*, 1928, for a brief discussion.) Attempts were being made to determine whether such qualities as speed of function, accuracy, perseveration, honesty, and the like bear the earmarks of general or specific factors. *Cross Roads in the Mind of Man*, by T. L. Kelley, Stanford University Press, 1928, presents an excellent survey of both experimental and theoretical material.

The controversy concerning the nature of the mental endowment of human beings aroused by the attack of Watson and others upon the traditional instincts a few years previously still continued. A number of studies of early infancy now in progress, notably that of Gesell in the Psychoclinic at Yale University, would eventually make positive contributions to the solution of this important but difficult question. The activities of the Child Development Institute, New York City, where a few infants are kept under 24-hour observation, will contribute most valuable data. At the University of Michigan, plans were under way for a similar project which would make possible continuous observations of a large number of infants. Meanwhile, discussion continues as evidenced by the articles appearing in the *Psychological Review* (1928) and other similar journals.

Gestalt psychology and its place in general psychology was a matter of active discussion. Interest in this problem was stimulated by the appointment of Prof. Kurt Koffka, one of the German exponents of Gestalt, to fill the William Allan Neilson Professorship at Smith College. A book on the subject was announced by an American publisher under the authorship of Wolfgang Koehler, Professor of Philosophy, University of Berlin, another of the German leaders of the Gestalt movement.

The conditioned reflex, offered as a mechanism of learning in animals through the studies of Pavlov and others, was beginning to usurp the place held by the Laws of Association as the explanation of human learning. The studies of conditioning in infants and adults had seemed to

some investigators to offer not only a substitute explanation for learning by association but to show how behavior patterns, particularly of emotional type which have been thought to be native, could be acquired in early infancy and childhood through a conditioning process. The monumental work of Pavlov is now available to the English world in *Conditioned Reflexes*, translated by G. V. Anrep (Oxford University Press, 1927).

Psychology: Its Facts and Principles, by Prof. H. L. Hollingworth, Columbia University (New York, 1928), represents an interesting attempt to systematize the subject in the light of the more recent movements in psychology. "It seeks at once to eliminate the dualism of mind and body, so characteristic of traditional psychology, and also to reconcile in a single synthesis the subjective and objective approaches to the study of the mind. A single set of simple working concepts based on observation and experiment serves to describe results in both the introspective and behavioristic fields." Another volume which presents a clear picture of the present status of psychology is *An Historical Introduction to Modern Psychology*, by Gardner Murphy (New York, 1928).

ANIMAL PSYCHOLOGY. Productive work was rapidly increasing in the animal laboratories, particularly in the United States, owing mainly to the fact that many of the puzzling problems of human psychology can be attacked in the work on animals. The laws of human learning have been called into serious question during the last few years, especially the so-called "Law of Effect" which states that the satisfaction following a reaction tends to stamp in that reaction so that on a later occasion that particular reaction will tend to be repeated. Likewise the "Trial and Error" conception of learning has been subjected to critical analysis, largely through the discovery of learning through insight in the high animals (see Wolfgang Koehler, *The Mentality of Apes*). The studies of animals were aiding materially in the solution of these problems. For example, the researches at the Institute of Psychology at Yale University under the direction of Prof. R. M. Yerkes was throwing light upon the question of insight versus trial and error as a means of solving problems. Work of a similar nature was being done at Clark University by Prof. W. S. Hunter. In the Animal Laboratory of the Department of Psychology at Columbia University, under the direction of Prof. C. J. Warden, a series of studies was almost completed on the motivation of animal behavior. The strength of the hunger impulse, thirst impulse, sex and maternal impulses had been studied and measured and their relative potency in determining behavior evaluated. The Animal Laboratory at Stanford University, under Dr. C. P. Stone, was continuing its study of the development of sex activity in animals and the factors which influence the strength of the sex impulses.

The Neurological Department of the College of Physicians and Surgeons of Columbia University, under Dr. Frederick Tilney, began a series of researches on the factors contributing to the sense of direction in animals. This project grew out of the detailed examination of the sensory and other capacities of Helen Keller, by Dr. Tilney, in which certain clues to a sense of direction were detected. After a lapse of a few years from the active work on animals carried on by Dr.

John B. Watson, Johns Hopkins University was planning to initiate studies in animal learning.

At the University of Toronto, Dr. W. E. Blatz had made a comparison of the behavior of human subjects and chimpanzees in similar, controlled situations. Some 28 children had completed the first stages of the experiment. The approach of the children to the experimental situation was very much like that of the apes, except for their use of language. This was very significant for an analysis of the learning process.

EDUCATIONAL PSYCHOLOGY. One of the outstanding events in the field of Educational Psychology in 1928 was the publication of *The Twenty-Seventh Yearbook* of the National Society for the Study of Education, under the leadership of Prof. Lewis M. Terman, of Stanford University. Two volumes of this yearbook were devoted to an attack upon the problem of nature and nurture as they affect achievement. The large individual differences that have been found in tests of intelligence and achievement have raised the issue as to their causes.

The issues which are involved are obviously of great consequence for educational theory and practice, since they are part and parcel of the age-old problem as to the relative influence of nature and nurture upon human destinies. If the differences found are due in the main to controllable factors of environment and training, then, theoretically, at least, they can be wiped out by appropriate educational procedures which it would then become our duty to provide. On the other hand, if they are due primarily to differences in original endowment, then the duty of the school is clearly to provide for differentiated training which will take these native differences into account (p. 1).

The first volume of the *Yearbook* is devoted to the "Influence of Nature and Nurture upon Intelligence" and presents a series of studies of the various factors influencing intelligence-test scores such as membership in a given family, social environment, race, schooling, health, physique, and special training or coaching. The second volume covers the "Influence of Nature and Nurture upon Achievement," and includes studies of the effects of intelligence, effort, amount of time spent on study, and cost of instruction.

The contribution of the whole project to educational theory and practice is expressed in the following quotation (p. 6):

Readers who do not sufficiently appreciate the inherent difficulties and complexities of the problem, particularly the difficulty of securing factual data that are at once crucial and unambiguous, will perhaps be disappointed in the lack of perfect consistency in the results of various contributors. For certainly it must be admitted that no final answer to the nature-nurture question has been attained, or even approximated. The most that can justly be claimed is that the bounds of our knowledge have been in some measure extended. Anyone who has reasonable regard for the fundamental importance of the problem will be grateful for any advance in our knowledge, however slight, which the contributions of this Year Book have accomplished. It is conceivable that the elusive nature of the problem is such as to preclude for a long time to come, if not forever, a complete and final solution. One needs to cultivate patience and the faculty of suspending judgment.

The problems of adult education are receiving increasing attention under the stimulation of the American Association for Adult Education. A part of the work of the Institute of Educational Research, Teachers College, Columbia University, on the problem is reported in *Adult Learning* (New York, 1928) by E. L. Thorndike and others. The following statements taken from

Chapter 13 on practical applications will indicate the significance of this interesting research:

In general, nobody under forty-five should restrain himself from trying to learn anything because of a belief or fear that he is too old to be able to learn it. Nor should he use that fear as an excuse for not learning anything which he ought to learn. . . . In general, teachers of adults of age 25 to 45 should expect them to learn at nearly the same rate and in nearly the same manner as they would have learned the same thing at fifteen to twenty. . . . The provision of opportunities whereby adults can learn those things which they are able to learn, and which it is for the common good that they should learn is a safe philanthropy and a productive investment for the nation. . . . Age, in itself, is a minor factor in either success or failure. Capacity, interest, energy, and time are the essentials.

Along with this interest in the adult, there goes an equally strong interest in the mental characteristics and development of the infant and pre-school child. Research was in progress in the Institutes for Child Welfare at the University of Iowa, Columbia University, University of Minnesota, University of California, and elsewhere. The Yale Psycho-Clinic, under the direction of Dr. Arnold Gesell, has published a further report of the findings in *Infancy and Human Growth*. They had prepared a schedule of 135 behavior manifestations which are characteristic of normal stages of development during the first year of life, and which may serve as the basis of a measuring scale for this early period.

An excellent review of *Child Psychology*, by B. T. Baldwin, appears as No. 11 of vol. 25 of the *Psychological Bulletin* (1928). It is in the form of an annotated bibliography of 539 titles.

MENTAL TESTS. In the field of mental tests, progress was made in the development of instruments for the measurement of character and personality traits, and of special aptitudes. These problems were usurping much of the interest formerly directed to the more general measures of intelligence. *Aptitude Testing*, by Prof. Clark Hull, of the University of Wisconsin, gives an excellent account of the problems involved in the measurement of special aptitudes, the statistical procedure to be used, and the methods of standardizing and validating the tests. The need for a book of this type is reflected in a statement from its preface:

Of course it is possible for one who has no scientific understanding of test methods to learn the simple procedures of test administration and test scoring, or even to carry on a certain amount of routine manipulation of test data, but there is a growing recognition of the dangers involved in this kind of work. The rapid multiplication of well-planned measurement courses in teachers' colleges and universities may be expected in time to remove all excuse for testing on the lower amateur levels. That time, in fact, seems to be drawing very near, and its advent is being materially hastened by the publication of textbooks which go beyond the superficial aspects of the subject.

Studies in Deceit, by Profs. Mark A. May and Hugh Hartshorne (New York, 1928), embodies the results of several years of research supported by the Institute of Social and Religious Research, and conducted in the Institute of Educational Research (Psychological Division) at Teachers College, Columbia University. The problem assigned the investigators was "the study of the actual experiences of children which have moral and religious significance and the effects for periods of time of the moral and religious influences to which children, youth, and adults have been exposed," and the "application of the objective methods of the laboratory to the measurement of conduct under controlled condi-

tions." Trustworthiness was chosen for intensive study. The techniques which were developed for that purpose will serve as the model for the construction of tests for measurement of other character traits. The book contains also the results of studies to determine the effects of moral and religious instruction as well as a general discussion of moral values in contemporary education.

Devices for the measurement of interest had reached a stage where their practical utility has been demonstrated. The work at Stanford University, California, resulted in the publication of the Vocational Interest Blank which may be used for the detection of interest in eighteen or more vocations. A central bureau for the scoring and interpretation of the test records was being established at Stanford University. Among the vocations for which the interest test was applicable are those of lawyer, engineer, minister, banker, artist, office worker, salesman, and school-teacher.

APPLIED PSYCHOLOGY. The Australian Institute of Industrial Psychology organized in September, 1927, whose director was A. H. Martin, University of Sydney, completed its first year. Many problems of vocational guidance and industrial efficiency were successfully handled. The Institute is similar in organization to the National Institute of Industrial Psychology in England.

One of the most promising new activities in Applied Psychology was the coöperative research project of the Yale University and Columbia University law schools on the subject of Evidence and its psychological analysis. Several reports had already been published and others were in preparation. They appear in the *Law Reviews* of the two institutions. Among the problems studied thus far were motivation, habit, memory, and character in their relation to the interpretation of evidence.

The Committee on Personnel Methods of the American Council on Education held a conference on Coöperative Experiments in Personnel Methods, at Briar Cliff Manor, N. Y., in April, 1928. A high-school record card and a college record card were demonstrated. These with a manual of instructions were ordered printed for distribution during the summer. A report of a sub-committee concerned devices for the measurement of personality. It recommended that, in the absence of satisfactory character tests, rating scales should be improved and used until they could be replaced by real test instruments. A rating scale together with proper instructions for using it was described. This material was published as a supplement to the *Educational Record* (July, 1928).

A significant attempt to determine the relationship between scholarship and business success appears in the article by Walter S. Gifford in *Harper's Magazine* (May, 1928), entitled "Does Business Want Scholars?" The conclusions were based on records of success of thousands of college graduates. The answer to the question is that scholarship and business show a high positive correlation.

To be sure, they deal with averages just as actuarial statistics do in estimating the "expectation" of life for the individual. A high-stand scholar may miserably fail and a low-stand scholar may notably succeed, but, taking the averages, the men in the first tenth of their respective classes began in about five years to earn more than the other college men, and continued to increase

their advantage as the years went on. This was true, though not quite to the same degree, of men in the first third of the classes, whereas the men in the lowest third earned least, and the longer they were in business the slower their earnings rose. From this it is deducted that a man in the highest tenth in scholarship at a college has two chances in ten of standing in the highest ten in salary as compared with the one chance in twenty-two which the man in the lowest tenth has.

That Russia had become actively engaged in practical psychological work was indicated by the programme of the first Federal Conference on Psychophysiology of Labor and Vocational Guidance held in Moscow, May 29 to June 3, 1928. Discussions and conferences were held on such topics as Methods of Mental Testing, Vocational Guidance and Selection, Exercise, Fatigue, and Physiology of Work. Special studies were made of the use of the hammer and file in industrial work after the manner of the analyses made in the United States by means of the micromotion picture. Another conference was arranged for 1929 in Leningrad.

During the year 1928, renewed interest had developed in the psychological and physiological problems of physical and mental work. The application of metabolism measuring methods to determine the energy cost of different kinds of work and work under different conditions has brought forth practical results in the laboratories of A. V. Hill, England, Atzler in Berlin, and the Industrial Fatigue Research Board of England. *Arbeitsphysiologie*, a new German periodical, was inaugurated in February, 1928, for the publication of such material. It has an international board of coöperating editors.

ABNORMAL PSYCHOLOGY. The activities of psychologists interested in the field of Abnormal Psychology in 1928 were directed mainly toward the detection, measurement, and correction of personality defects which lead into more serious mental disturbances if corrective measures are not applied. Thus, in *The Psychology of the Adolescent*, by L. S. Hollingworth (New York, 1928), there is a treatment of the normal course of development of the adolescent with a great deal of attention paid to the factors which may lead from the normal to the distorted personality during this period. Likewise, in *Modern Psychology: Normal and Abnormal*, by D. Leary (Phila. 1928), the normal and the abnormal are linked in a single discussion. And J. J. B. Morgan in *The Psychology of Abnormal People* (New York, 1928), treats cases of abnormality as deviations from the normal rather than as phenomena in a class by themselves. *The Psychology of Personality*, by E. Bagby (New York, 1928), is a definite attempt to interpret the more serious personality disorders in terms of exaggerations of normal personality trends. He makes much use of conditioned reactions, disabling fears, worries, day-dreaming, inferiority feelings, defense reactions, etc., in his analysis of personality.

As an instance of a mild disability which may lead into serious personality difficulties, stuttering and other speech defects were receiving renewed attention along with defects of vision, hearing, and other handicaps. The nature of the attack in this field was indicated in *The Problem of Stuttering*, by J. M. Fletcher (New York, 1928), and *Speech Pathology with Methods in Speech Correction* (Expression Co., 1928).

Among the tests constructed for the purpose of detecting significant personality traits was

that of G. W. Allport for the measurement of Ascendancy and Submission (*Journal of Abnormal and Social Psychology*, 1928, vol. 23, p. 118). An actual study of the predictive value of a number of such personality measuring scales was made by E. G. Flemming for use by college students (*Archives of Psychology*, No. 96, 1928).

SOCIAL PSYCHOLOGY. The developments in the field of Social Psychology during the year 1928 might appear rather intangible to the casual reader, although the careful observer can see lines of active research which will eventually provide the foundation for a sound social psychology. The work of F. H. Allport (*Social Psychology*, 1924) has had its influence in directing interest toward experiment and measurement and away from speculation.

These studies in social psychology were taking the form of tests primarily—tests of character and temperament and of the influence of one person upon another or of one group upon another group. In fact, the tremendous accumulation of data from the administration of tests to individuals, to racial, social, and occupational groups, to delinquents, to groups differing in age, sex, and environmental contacts, might all be considered the data of social psychology. Typical of such material are the following articles appearing in the *Journal of Abnormal and Social Psychology*: Watson, G. B., "Do Groups Think more Efficiently than Individuals?" (p. 328); Lehman, H. C. and Witty, P. A., "Sex Differences in Credulity," (p. 356); Travis, L. E., "The Influence of the Group upon the Stutterer's Speed in Free Association" (p. 45); Lima, Margaret, "Racial Differences in Intelligence in Minnesota" (p. 68); Allport, G. W., "A Test for Ascendancy-Submission" (p. 117).

Out of this wealth of test material, there was developing a more critical attitude toward the concept of racial superiority and a search for environmental and training factors that might account for racial differences in test scores. An ambitious experimental project under the direction of Franz Boas, Professor of Anthropology in Columbia University, was intended to discover the relative native endowment of certain Indian tribes, certain Negro groups, and groups of selected whites. This project involved the construction and standardization of tests for each racial group, rather than the use of tests standardized upon cultured whites.

The book by F. H. Hertz, *Race and Civilization* (New York, 1928), reviews the arguments for race superiority from the Greeks to the present. The Social Science Research Council was supporting a project for the construction of a scale to measure attitudes toward Negroes and the application of this scale to the measurement of the attitudes characteristic of various population groups.

The attention of social psychologists was being directed toward the study of abnormalities and delinquencies and their causes. An extensive investigation of "Personality Traits and Community Factors in Juvenile Delinquency" was begun by the Institute for Juvenile Research, of Chicago, with the support of the Social Science Research Council. The review of the literature on Criminology by R. H. Gault (*Psychological Bulletin*, 1927, vol. 24, p. 692) contains 101 titles on such matters as the effects of capital punishment, parole, probation, sterilization, pardons, etc., on the community.

A very practical attack upon social problems was made possible by the establishment of a fund of \$36,000 at the School of Education of New York University for a three-year study of the effect of a boys'-club programme upon a local community, and its boy problems in New York City. The fund was to be used primarily for establishing fellowships and scholarships. The work was to be directed by Frederick M. Thrasher and an advisory council of experts in this field of research.

The investigation will be unique in that it will attempt a complete community case-study in which all factors will be considered in their interrelationships, normal as well as pathological. A recently established boys' club (with a total capacity of 9000 boys) will be used as a laboratory for the study, and the problems of the community will be investigated before the development of the club and during the first three years of its program.

PUBLIC AFFAIRS, INSTITUTE OF. Inaugurated in 1927 at the University of Virginia as an experiment for the purpose of advancing the popular understanding of public questions and stimulating in the public mind a more vital interest in public matters, particularly the domestic problems of the United States. The attendance at the 1928 session consisted of 116 delegates from Virginia, appointed by Governor Byrd; 21 delegates appointed by organizations in other States; 276 registered members from 37 States and 6 foreign countries; and 812 registered visitors, not including the summer-session students. Membership in the Institute is open to men and women who have taken part in public life and to those who are interested in any phase of public affairs, national, State, or local. Members may attend all lectures and addresses delivered during the session and any two of the round-table discussion groups. The programme of the 1928 session was planned in accordance with the announced purpose of the Institute to limit its discussions primarily to a study of governmental problems of national, State, and local concern, and to certain economic and social conditions underlying them. However, since Latin-American affairs are so intimately connected with the economic and industrial progress, as well as with the national policy of the United States, a round table and open forum on this subject was introduced and proved one of the most interesting features of the institute, and it was predicted that some phase of foreign relations would be a feature of each recurring session. The programme in 1928 consisted of 11 round tables, each of which met every other day during two weeks; an open forum each morning; and an address each evening.

Following is a list of the round-table subjects with their leaders: The Agricultural Problem, Dr. John D. Black, professor of agricultural economics at Harvard University; Women in Modern Society, Dr. Aurelia Henry Reinhardt, president of Mills College, California; Our Latin-American Relations, Dr. John H. Latané, professor of American history at Johns Hopkins University; Municipal Management, Dr. Thomas H. Reed, professor of municipal government at the University of Michigan; County and Township Government, Dr. Kirk H. Porter, associate professor of political science at the University of Iowa; Political Parties, Dr. A. R. Hatton, professor of political science at Northwestern University; the Tax problem, the Hon. Mark Graves, tax commissioner of the State of New

York; The Influence of the Press in Public Affairs, Dr. Victor Rosewater, journalist, editor, and former publisher of the *Omaha Bee*; The Economic and Industrial Development of the South, Dr. Bradford Knapp, president of the Alabama Polytechnic Institute; Arbitration of Commercial Disputes, Dr. Wesley A. Sturges, of the Yale University Law School; and Aeronautics, Dr. Otto Schreiber, head of the Air Law Institute, Koenigsberg University, Germany.

Evening addresses were delivered as follows: The Crisis of Democracy, Count Carol Sforza; Awakening the Public Conscience to Proper Municipal Management, the Hon. George A. Levy; The Solid South—Its Cause?—Its Future? Mrs. Sarah Lee Fain; Sectionalism and National Politics, the Hon. Ralph R. Lounsbury; Public Welfare and Municipal Administration, Dr. William J. Hickson; The South at the Parting of the Ways, Dr. William E. Dodd; Political Parties, the Hon. Richard Washburn Child; Newspaper v. Political Corruption, Boyd Gurley; The Agricultural Problem in the Middle West, the Hon. L. Jesse Dickinson; Is There a Genuine Agricultural Problem? the Hon. Evans Woollen; Governmental Fundamentals, the Hon. Finis J. Garrett; Is Prohibition a Party Issue? Mrs. Nellie Taylor Ross; The Law of Aeronautics, Dr. Otto Schreiber; Arbitration of Commercial Disputes, Lee J. Eastman.

The invited speakers, in addition to those who participated in the round table and open forum, numbered 107. The officers of administration were: Dr. Edwin Anderson Alderman, president of the University of Virginia; Dr. Charles Gilmore Maphis, dean of the summer quarter and director of the Institute; and an advisory board composed of 29 prominent educators and recognized leaders in public affairs, selected from all sections of the country and from the two political parties.

PUBLIC FINANCE, UNITED STATES. American public finance, during the year 1928, afforded no characteristic features. The year was really a period of continuation of what had been begun and attempted during the preceding year or two. Neither in the development of a tax programme nor in the collection of international debts due the United States was there any material innovation. From the standpoint of routine Treasury management, the year was commonplace. Operations in continuation of refunding and the like presented no new problems. The experience of the twelve months did throw some light upon the working of changes already made and in the real distribution of tax burdens within the United States, but it did not afford any decisive solutions even of these.

The total ordinary receipts of the year were slightly in excess of those of the preceding season so far as most sources of revenue were concerned, but in the two largest—income tax and customs—there was a slight shrinkage. The net outcome was to leave receipts about \$87,000,000 behind those of 1927, but the reduction thus actually suffered was not as great as had been expected or provided for, so that it still left a margin when compared with expenditure. The table on page 634 furnishes a general view of the development of the revenue situation within recent years.

Included in the receipts from miscellaneous sources were the proceeds of the sale of foreign obligations, which ran nearly as heavily as ever,

ORDINARY RECEIPTS, FISCAL YEARS 1920 TO 1927
[On basis of daily Treasury statements (unrevised)]

Year ending June 30—	Customs	Income and profits taxes	Miscellaneous internal revenue	Miscellaneous revenues, including Panama Canal Proceeds from foreign obligations	All other	Total
1920.....	\$322,902,650	\$3,944,949,288	\$1,460,082,287	\$74,296,622	\$892,334,542	\$6,694,565,389
1921.....	308,564,391	3,206,046,158	1,390,379,823	114,821,206	605,121,383	5,624,932,961
1922.....	356,443,387	2,068,128,193	1,145,125,064	75,222,068	464,185,439	4,109,104,151
1923.....	561,928,867	1,678,607,428	945,865,333	232,989,156	587,744,697	4,007,135,481
1924.....	545,637,504	1,842,144,418	953,012,618	221,774,675	449,475,487	4,012,044,702
1925.....	547,561,226	1,760,337,823	828,638,068	183,637,677	459,773,890	3,780,148,684
1926.....	579,430,093	1,982,040,088	855,599,289	194,237,957	351,448,263	3,962,755,690
1927.....	605,499,983	2,224,992,800	644,421,543	206,089,173	448,390,943	4,129,394,441
1928.....	569,000,000	2,173,400,000	621,000,000	205,900,000	468,900,000	4,042,300,000

EXPENDITURES CHARGEABLE AGAINST ORDINARY RECEIPTS

General Expenditures	1927	1928
Legislative establishment	\$ 19,678,325.13	\$ 16,402,048.28
Executive proper	612,197.93	589,497.19
State Department	16,497,668.60	11,607,071.23
Treasury Department	151,560,333.78	195,648,941.27
War Department	360,808,776.71	390,540,803.49

Navy Department	318,909,096.28	331,335,491.98
Interior Department	302,706,745.19	298,999,534.09
Department of Agriculture	156,287,304.95	159,914,696.27
Department of Commerce	30,939,749.02	34,383,165.32
Department of Labor	9,921,644.26	9,821,480.97
Veterans' Bureau	391,470,413.72	401,324,833.17
Other independent offices and commissions	35,442,771.15	35,681,462.45
District of Columbia	37,566,520.57	39,399,622.44
Total	\$1,857,409,642.76	\$1,953,525,595.77
Deduct unclassified items	448,920.63	198,554.39
Total	\$1,857,858,563.39	\$1,953,327,041.38
Interest on public debt	\$ 787,019,578.18	\$ 731,764,476.30
Refunds of receipts:		
Customs	20,320,524.37	21,856,901.13
Internal revenue	117,412,172.61	148,286,060.13
Postal deficiency	27,263,191.12	32,080,202.46
Panama Canal	8,305,345.04	10,448,879.83
Operations in special accounts:		
Railroads	1,042,746.21	619,721.67
War Finance Corporation	27,065,781.61	3,813,040.77
Shipping Board	19,011,397.11	34,881,713.16
Alien property funds	496,117.92	351,151.52
Grain Corporation
Sugar Equalization Board
Purchase of obligations of foreign governments
Adjusted service certificate fund	115,219,352.30	111,817,839.69
Investment of trust funds:		
Government life-insurance fund	47,315,972.70	61,701,568.44
Civil-service retirement fund	425,194.65	109,272.28
District of Columbia teachers' retirement fund	289,980.43	513,917.75
Foreign-service retirement	87,267.50	80,938.85
General railroad contingent	870,677.84	1,179,957.39
Total ordinary	\$2,974,029,674.62	\$3,103,264,854.83
Public debt retirements chargeable against ordinary receipts:		
Sinking fund	\$333,528,400.00	\$354,741,300.00
Purchases from foreign repayments	19,254,500.00	19,068,000.00
Received from foreign governments under debt settlements ..	159,961,800.00	162,736,050.00
Received for estate taxes	1,500.00
Purchases from franchise tax receipts (Federal Reserve and Federal intermediate credit banks)	1,231,834.78	618,367.05
Forfeitures, gifts, etc.	5,578,310.00	3,089,803.25
Total	\$519,554,844.78	\$540,255,020.30
Total expenditures chargeable against ordinary receipts ..	\$3,493,584,519.40	\$3,643,519,875.13
Surplus (+) or deficit (—).....	+\$635,809,921.70	+\$398,828,281.06

of railroad securities which had been reduced, and of several other items, all sufficient to show in the aggregate a total of about \$469,000,000 or some \$21,000,000 more than in 1927.

Included in the collections of tax arrears are sums which amounted to a very considerable amount indicative of the continuation of great activity in settling obligations which had been

allowed to fall behind. Considerable progress was made in working toward a contemporary position in tax collections. Even at the close of the year, however, the department was still very much behind in its work. Customs duties at \$569,000,000 were still about \$36,000,000 lower than in 1927 as a consequence of a falling off in importation, partly the outgrowth of very severe customs ad-

ministration and partly the result of new and higher duties on imported goods which had been imposed at the instance of President Coolidge as embodied in proclamations issued by him for the purpose of raising the duties which Congress had authorized him to alter when it included the so-called flexible tariff sections in the act of 1922. Shrinkage of internal revenue, although very moderate indeed, notwithstanding the fact of an increase in individual incomes subject to taxation was largely the result of falling off of internal duties which had previously been very heavy but had now reached the turning point and started on a decline.

FEDERAL EXPENDITURES. The expenditures for the year amounting to \$1,953,000,000 were obviously considerably lower than outgoes for the preceding year. Accompanying tables furnish a survey of the principal items of expenditure for 1928 as compared with those for 1927. The total of expenditure was \$1,953,525,000 exclusive of the public debt and operations on special accounts. As the table on page 634 shows, the principal items of outlay did not, however, run very differently from those of the preceding year.

THE SURPLUS. For several years, discussion of the Treasury surplus had at times assumed a very acute position. There was a feeling that regular surpluses were being accumulated for the purpose of reducing the public debt, notwithstanding that it was asserted in connection with the budget that such surpluses were incidental or incalculable. During the income-tax revision of 1927, sharp controversy arose between Secretary of the Treasury Mellon and the Chamber of Commerce of the United States, the latter body asking for a much larger cut in taxation than had been proposed and asserting that the surplus situation would allow it. In the revision in question, it was officially stated that curtailments arranged for would practically eliminate the surplus. The following table furnishes the details of surplus development for the years 1920-1928 and shows that whereas for the fiscal year 1927 the indicated surplus was \$635,000,000, the largest sum in any year on record, the surplus for the fiscal year of 1928 was officially stated as \$398,000,000, a figure which was exceeded only by the returns for 1927 and 1924.

ORDINARY RECEIPTS, EXPENDITURES CHARGEABLE AGAINST ORDINARY RECEIPTS, AND SURPLUS 1920 TO 1928

[On basis of daily Treasury statements (unrevised)]

Fiscal year	Total ordinary receipts	Expenditures chargeable against ordinary receipts	Surplus
1920 ..	\$6,694,565,388	\$6,482,090,191	\$212,475,197
1921 ..	5,624,932,960	5,538,209,189	86,723,771
1922 ..	4,109,104,150	3,795,302,499	313,801,651
1923 ..	4,007,135,480	3,697,478,020	309,657,460
1924 ..	4,012,044,701	3,506,677,715	505,366,986
1925 ..	3,780,148,684	3,529,643,446	250,505,238
1926 ..	3,962,755,690	3,584,987,873	377,767,817
1927 ..	4,129,394,441	3,493,584,519	635,809,922
1928 ..	4,042,348,156	3,643,519,875	398,828,281

This surplus, however, related to a period ending with June 30, 1928, and computations for the year 1929 indicated a further reduction of it, while during the first month of the winter session of Congress of 1928, recommendations made by the Treasury Department for refunds of taxes illegally collected called for appropriations which if fully disbursed would probably eliminate much of the balance on hand and in the opinion of some Treasury authorities may even

go so far as to create a deficit. It was undoubtedly true that with transactions as large as those involved in the income-tax system it was difficult to estimate the contingent liabilities of the Treasury Department, so that an indicated surplus was at all times a desirable adjunct to the easy management of fiscal affairs. The situation may be summed up at all events by stating that, despite reductions in taxation, there was still a large indicated surplus with controversial discussion as to contingent liability.

PUBLIC DEBT SITUATION. During the year 1928, the French Government continued to defer ratification of the debt-funding treaty that had been previously concluded, but it maintained the policy already established in 1927, of making regular payments on the obligations named by the treaty, just as if the document had in fact been ratified. Payments also were made, as agreed, by other countries, with which treaties had been established as a result of the efforts of the World War Debt Funding Commission, and with the funds thus placed in the hands of the department (and with such contributions from surplus as could be made from time to time), further reductions were made in the outstanding public debt. During the year 1928, the total amount of reduction was \$905,833,703, the entire debt being reduced from \$18,510,174,226 gross, to \$17,604,290,562 gross. This reduction was smaller than had been the case in any recent year and was of course effected in some measure by the use of amounts received from foreign countries which were stated as about \$161,000,000 interest and \$47,000,000 principal. The total realized from the sale of railroad and other securities was about \$175,000,000, however, and this taken with the proceeds of foreign payments thus constituted a substantial fraction of the entire amount of debt reduction. According to the official statement, the amount discharged from ordinary receipts was \$540,246,020. The table on page 636 shows the debt situation in condensed form. Note should be made of the final conclusion of the process of refunding the Third Liberty Loan, the outstanding bonds of that loan being converted into notes and certificates of comparatively short term.

TREASURY FINANCE. Taken in conjunction with the refunding of the Second Liberty Loan in 1927, the disposal of the Third Liberties remaining outstanding, which took place during 1928, made a great change in the general character of the outstanding debt. It left the long-term bonds of the First and Fourth Liberty Loans still in existence on the same basis as originally, while the post-war Treasury bonds of long term would not begin maturing until 1940, but it effectually put the great bulk of the remainder of the World War financing, amounting to \$5,000,000 more or less, into short-term notes and certificates with a series of maturities spaced during the coming decade in such a way as to necessitate practically continuous operations.

This process of refinancing had been developed during the years soon after the close of the War, and was in line with the special method of Treasury management which had been worked out by Secretary McAdoo and his aids, some of the latter holding over from the Democratic into the Republican administration and bringing with them the same methods of finance that had become well known during the McAdoo period. Such continuous refunding was desirable only in

PRELIMINARY STATEMENT OF THE PUBLIC DEBT OUTSTANDING OCTOBER 31, 1928, BY
ISSUES
[On basis of daily Treasury statements (unrevised)]

Bonds:		
Consols of 1930	\$ 599,724,050.00

the event that a continuously declining, or at all events a steadily-maintained low, rate of interest could be made to prevail in the open market. However, the year 1928 witnessed the inevitable transition from exceedingly plentiful money and low rates of interest to tight money and high rates. This was inevitable in view of the tremendous bank expansion that had been in progress, but it of course brought with it certain necessary consequences in connection with Treasury finance. Whereas the Second Liberty Loan had been converted in 1927 into refunding notes on a basis as low as 3½ per cent, the Treasury financing which grew out of the Third Liberty transactions in 1928 had to be placed at rates

varying from 3¼ per cent to 4½ per cent with subsequent certificate transactions at an even higher rate, the final offering being 4¾ per cent, while it became more and more necessary to have the reserve banks support the market for Treasury obligations by standing ready to take them off the hands of large holders or dealers subject to a so-called "repurchase agreement" whereby the reserve banks bound themselves to return such obligations to those from whom they had been taken, should the latter at any time desire such action.

In these circumstances, the Treasury refinancing necessarily became a great burden upon the reserve banks, even at the higher rates which the

department had named, while the volume of subscriptions for Treasury operations tended to fall off in a striking manner. The close of the year, with its extraordinarily high money rates in the open market, apparently opened a period of increasing difficulty in Treasury finance due to the necessity of coping with difficult banking conditions.

BUDGET ESTIMATES. Estimates of outlay for the year 1928-29 were as usual prepared by the

Treasury together with a forecast of the probable situation in the year 1929-1930. As thus presented, the indicated expenditures for the year 1930 were figured at \$3,227,000,000 as against \$3,252,000,000 for the preceding year, an indicated probable surplus of about \$30,000,000. Accompanying this was the official indication that reduction of Federal expenditures, except in so far as the future refunding of the debt might bring economies, had practically reached its

SUMMARY OF RECEIPTS AND EXPENDITURES FOR THE FISCAL YEAR 1928, ON THE BASIS OF DAILY TREASURY STATEMENTS (UNREVISED), AND ESTIMATED RECEIPTS AND EXPENDITURES FOR THE FISCAL YEARS 1929 AND 1930

Board of trustees, Postal Savings System, balances		50,545,764.88	
Balance to credit of postmasters, etc.		2,430.00	
Retirement of additional circulating notes (Act of May 30, 1908)		3,532,502.23	
Uncollected items, exchanges, etc.			229,571,186.02
Balance in Treasury June 30, 1928			\$260,190,330.85

imit. Private interest, desirous of income-tax reform, continued however to be of the opinion that further savings were entirely possible, and that the indicated surplus for the year 1929, taking into account most ordinary and extraordinary receipts, was sufficient to warrant an expectation of possible further revision of taxation. The estimates for the year 1930 were presented to Congress at the opening of the session in December 1928 as shown in the table on page 637.

GENERAL FUND OF THE TREASURY. The general fund or current cash condition of the Treasury reflected comparatively few changes of importance. Actual returns as presented in the annual report on the finances were as shown on page 637.

LEGISLATION, NEW AND PROPOSED. The legislation of the year was confined to the so-called Income Tax Amendment Act of 1928 which had already been proposed and passed by the Lower House before the close of 1927. While the Act of 1928 had been looked forward to as making great changes in the burden of taxation, the alterations actually introduced were comparatively few and contrary to expectation were not made retroactive, so that they come into effect first in the returns of 1929 (for the income of 1928).

The major changes in taxes and rates in the Revenue Act of 1928 were as follows:

Corporation income tax: The rate of tax was reduced from 13½ to 12 per cent, applicable to incomes of 1928 and succeeding years. The "specific credit" allowed domestic corporations having a net income of \$25,000 or less was increased from \$2000 to \$3000.

Individual income tax: The maximum net income on which an earned income credit is allowed was increased from \$20,000 to \$30,000.

Automobile tax: The tax of 3 per cent on manufacturers' sales of passenger automobiles was repealed. Admissions and dues: Amounts paid for admissions to theatres and other places of amusements of \$3 or less were exempted from tax as compared with 75 cents or less under the preceding act. On admissions of \$5 or more to prize fights, however, the rate was increased from 10 to 25 per cent. The annual club dues exempted from tax were increased from \$10 to \$25.

Miscellaneous: The amount withheld at the source was increased in the case of certain tax-free covenant bonds owned by non-resident aliens, foreign corporations, and unknown holders. The tax of one cent per gallon on cereal beverages was repealed. The tax was reduced on still wines from 16 cents, 40 cents, and \$1 to 4, 10, and 25 cents, respectively, per gallon according to alcoholic content; and on grape brandy from 60 cents to 10 cents per proof gallon. The special tax on retailers of narcotics was reduced from \$6 to \$3 per annum. The tax on the use of foreign-built boats was repealed, but the term "motor boat" in the Tariff Act of 1922 was defined to include yachts and pleasure boats.

PUISEUX, PIERRE-HENRI. French astronomer, died September 28. Born at Paris, July 20, 1895, he studied at the École Normale Supérieure, where he received the D.Sc. degree in mathematics in 1879. He later lectured at the Sorbonne, and was appointed honorary professor on the Faculté des Sciences of the Université de Paris. He was made astronomer at the Paris Observatory in 1907, in charge of charting the sky. Dr. Puisseux was elected to the Paris Academy of Sciences in 1912, and was at one time

president of the French Astronomical Society. Besides his thesis of 1879 on *L'Accélération Séculaire du Mouvement de la Lune*, he wrote *Cours de Cinématique*, and *La Terre et la Lune: Forme Extérieure et Structure Interne* (1907), and he collaborated with Loewy in *L'Atlas Photographique de la Lune* (1896-1910).

PULITZER PRIZES. See LITERATURE, ENGLISH AND AMERICAN; THEATRE.

PUTNEY, put'nē, ALBERT HUTCHINSON. American lawyer and educator, died at Washington, D. C., October 22. He was born at Boston, Sept. 28, 1872, and was graduated from Yale in 1893, and from the law school of the Boston University in 1895. He practiced in Boston at first, but later moved to Chicago, where he worked from 1899 until 1913, also acting as professor in the Illinois College of Law, 1900-12, and as dean, 1904-12. He was made chief of the Near Eastern Division, of the U. S. Department of State, in 1913, served in this capacity throughout the World War and until 1920. During this time he studied the positions of the smaller European nations, particularly that of Czechoslovakia, in order to formulate the basis upon which the United States could recognize their governments. Dr. Putney served during the same period, until his death, as professor at the National University Law School. He was made dean of the school of diplomacy and jurisprudence, of the American University, in 1920, and he also lectured at the University of Prague during the summer of 1923, on the government and constitution of the United States. Besides being decorated by Rumania and Lithuania, and receiving the D.C.L. degree from De Paul University, and the Ph.D. degree from the American University, he was awarded the Order of the White Lion by Czechoslovakia. Dr. Putney wrote extensively, among his most important works being the twelve-volume *Law Library* (1908), and *Principles of Political Economy* (1909).

QUEBEC, kwə-bék'. The largest province in Canada, and one of the four original provinces in the present Dominion of Canada; bounded on the west by Hudson Bay and Ontario, on the north by Hudson Strait, on the east by Labrador, and on the south by New Brunswick, the United States, and southern Ontario. Area, as amended by the Labrador Boundary award, 594,434 square miles; population, according to the census of 1921, 2,361,199, of whom 1,038,128 were rural, 357,295 of British origin, and 1,889,090 of French origin. Capital, Quebec. The chief cities with their populations, according to 1926 municipal statistics, are as follows: Montreal, 684,500; Quebec, 126,000; Hull, 35,233; Verdun, 42,247; Three Rivers, 35,000; and Sherbrooke, 25,021.

The provisional figures for the acreage and yield of the most important field crops for the year 1927 were as follows: Wheat, 61,000 acres, 1,141,000 bushels; oats, 1,782,000 acres, 51,856,000 bushels; barley, 125,000 acres, 3,213,000 bushels; rye, 12,200 acres, 222,000 bushels; flax, 2400 acres, 24,000 bushels; mixed grains, 117,000 acres, 3,475,000 bushels; other grains, 208,600 acres, 14,360,000 bushels; potatoes, 159,000

acres, 14,676,000 cwt.; roots, 34,000 acres, 4,940,000 cwt.; hay and clover, 4,153,000 acres, 5,607,000 tons; fodder corn, 88,000 acres, 700,000 tons.

The mineral production of the Province in 1928 amounted to \$37,023,645, or an increase of \$7,899,535 over 1927, with gold and copper in particular showing notable increases. Copper in 1928 was valued at \$4,910,306, as against \$407,146 in 1927; while gold in 1928 was valued at \$1,240,435, as against \$172,214 in 1927.

Quebec is the chief Canadian province in the production of pulpwood, having more than half of the Canadian production. The value of mineral production in 1926 was \$25,750,463. The total imports for consumption in 1925-26 amounted to \$253,428,000; total exports, \$423,235,000. The revenues for 1927 was \$30,924,997.01; expenditure, \$29,078,702.89. The public debt, as of June 30, 1928, was \$58,827,532. Quebec has 5267 miles of railway, including 400 miles of electric tramway. At the head of the Government is a lieutenant-governor appointed by the Governor-General of Canada, who acts through a responsible ministry; legislative power is vested in a bicameral body, a council of 24 members appointed for life, and a legislative assembly of 85 members elected for five years. Quebec is the only province in Canada in which women are not enfranchised or eligible for election to the legislature. Lieutenant-Governor in 1928, N. Pérodeau; Premier, Attorney-General, and Minister of Municipal Affairs, L. A. Taschereau; Lands and Forests, H. Mercier; Treasurer, J. Nicol; Secretary, A. David; Agriculture, J. E. Caron; Colonization, Mines and Fisheries, J. E. Perrault; Public Works and Labor, A. Galipeault; Roads, J. L. Perron; Ministers without portfolio, E. Moreau, L. Lapierre, J. H. Dillon.

QUEEN'S COLLEGE. A college for women at Charlotte, N. C., founded in 1771; non-sectarian in purpose, but under the direction of the Presbyterian Church. The enrollment for the autumn term of 1928 was 319. There were 32 members in the faculty. The income for the year amounted to \$130,000. The library contained 9000 volumes. President, William H. Frazer, D.D., Litt.D.

QUEENSLAND. A state in the Commonwealth of Australia situated north of New South Wales; the second largest of the constituent Australian states. Area, estimated at 670,500 square miles; population, according to the census of 1921, 755,972; estimated, Sept. 30, 1927, 897,419. The movement of population in 1926 was: Births, 19,765; deaths, 8215; marriages, 6428. The immigrants in the same year numbered 87,624 and the emigrants, 78,166. Capital, Brisbane, with a population in 1926 (10-mile radius), of 274,260 (census).

During 1926 there were 1739 state schools (including 13 high schools and 147 provisional schools) with 4230 teachers and an average daily attendance of 108,526. The total value of all crops in 1927 was £14,431,644 as compared with £12,181,917 in 1926. The principal crops are green fodder, sugar cane, corn, wheat, cotton, hay, and bananas. The total value of the mineral production in 1926 was £2,174,187. Since the discovery of the gold fields in 1858 the value of the gold output, to the end of 1926 was £85,234,496. Coal is also an important mineral product (1,221,059 tons produced in 1926), and among the other mineral products are copper, tin, wolfram, lead, cobalt, etc. In 1926-27 the imports amount-

ed to £13,497,779 and the exports to £14,721,176. The registered shipping in 1926 consisted of 173 sailing vessels of 6384 net tons and 74 steamers of 18,207 net tons. On June 30, 1926, 6240 miles of railways were open, of which 5964 were being worked.

Executive power is vested in a governor, who acts through a responsible ministry; and legislative power in a single chamber or legislative assembly of 72 members elected for three years (the legislative council was abolished in 1922). Governor in 1928, Sir T. H. J. C. Goodwin (appointed February, 1927); Lieutenant-Governor, W. Lennon; Prime Minister, W. McCormack.

QUESADA, PRESENTACION. Honduran statesman, died at Tegucigalpa, Honduras, July 15. He was Constitutional Vice President of Honduras, elected after the revolution of 1924, and a leader of the National or conservative party of the country. He was noted in Central America as a jurist. In the election that followed the revolution of 1924, Dr. Miguel Paz Barahona was elected President of Honduras and Dr. Quesada, Vice President, their election being proclaimed by the National Assembly Jan. 20, 1925.

QUICKSILVER. The world production of quicksilver for 1928 was estimated at about 150,000 flasks of 75 pounds each and commanded a price ranging from \$115 to \$135 per flask, or slightly higher than the previous record high price of the metal in 1927. The production in the United States in 1928 was estimated at about 17,000 flasks as against 11,276 flasks valued at \$1,314,782 in 1927 which was the greatest production since 1920 when 13,392 flasks were reported. The War year, 1918, showed a production of 32,883 flasks. A notable tendency during 1928 was the continued increase at the Almaden Mine in Spain which developed its production from 52,500 flasks for the season ended June 1, 1927, to more than 74,000 flasks for the corresponding season of 1927-28. In Italy, production was estimated at about 64,000 flasks with the Monte Amiata District showing increased production.

The quicksilver industry in the United States, especially mines in California and Nevada, flourished during the year and new plants were built, while old mines were reopened. The American industry seemed to be in a satisfactory condition and, in view of the development of the trust or cartel by Italian and Spanish producers able to control about 90 per cent of the world's output, promised to figure more extensively than ever both in domestic and other markets. In 1927 the United States imported 20,207 flasks, valued at \$1,780,134, while in 1928 there were imported 12,656,100 flasks, valued at \$1,572,017. The trust referred to above was reported controlled by the Spanish and Italian governments, the latter operating the Idria Mine. It was reported that this trust would curtail production so as to keep prices at a high level.

RACING. The "sport of kings" retained its strong hold on popular favor in 1928, the meetings conducted at the various tracks in the United States, Great Britain, France, Cuba, and Mexico attracting their customary throngs of turf followers. Edward B. McLean was the leader in purse winning, his stable turning in more than \$250,000. Other owners with goodly earnings were Harry Payne Whitney and Joseph E. and George D. Widener. Reigh Count, owned by Mrs. John D. Hertz, developed into the outstanding

thoroughbred of 1928 in the United States and after the season closed was shipped to England to become acclimated for an attempt to win the famous Ascot Gold Cup. Reigh Count triumphed over all opposition of his own age, three years, in the three principal tests of the year—the Saratoga Gold Cup, Lawrence Realization, and Jockey Club Gold Cup. Reigh Count also won the Kentucky Derby, his total earnings being \$111,040. This wonder horse would have come close to topping the renowned Man o' War in winnings had it not been for sickness and injuries which he suffered before and after the Kentucky Derby.

The champion two-year-old of 1928 was Marshall Field's High Strung, which won both the Belmont Futurity, worth \$97,990 and the Pimlico Futurity, worth \$50,750. Of the older horses, Mike Hall, a four-year-old, made the best showing, the performances of Crusader, Display, Hydromel, and Justice F. being most disappointing. Laverne Fator led the American jockeys in number of winning mounts.

The winners of the principal turf events in the United States were as follows: Futurity, High Strung; Preakness, Victorian; Kentucky Derby, Reigh Count; Hopeful, Jack High; Belmont Stakes, Vito; Withers, Victorian; Saratoga Special, Blue Larkspur; Travers, Petee Wrack; Suburban Handicap, Dolan; Metropolitan Handicap, Nimba; Saratoga Cup, Reigh Count; Brooklyn Handicap, Black Panther; Latonia Derby, Toro; Coffroth Handicap, Crystal Pennant.

Felstead, owned by Sir Hugo C. Owen, won the English Derby in 2:34 2-5, equaling the record set by Call Boy in 1927. Cride Guerre, owned by Ogden Mills, captured the Grand Prix de Paris. The Ascot Gold Cup went to Invershin, the Thousand Guineas to Scuttle, owned by King George, and the Grand National Steeplechase to Tipperary Tim. Billy Barton, an American horse, finished second in the Grand National.

HARNESS RACING. Winnipeg, a Canadian bred pacer, owned by E. J. Baker of St. Charles, Ill., and driven by Palin, set three records in 1928. This horse traveled the fastest race-mile (1:59¼), the fastest mile (1:57¾) and the fastest mile over a half-mile track (2:01). Spencer, a three-year-old, owned by David M. Look of Goshen, N. Y., tied a world trotting record for a mile against time at the Lexington meeting of the Grand Circuit, his mark being 1:59¼. Benelwyn turned in the fastest race-mile for trotters (2:01½). Hollywood Colin, a four-year-old, was the leading race winner among the Grand Circuit trotters.

RACE STUDIES. See **ANTHROPOLOGY**; **ZOOLOGY**, under *Heredity*.

RACQUETS. The racquets season in the United States in 1928 was featured by the visit to America of an English team comprising Hon. C. N. Bruce, J. C. F. Simpson, and P. W. Kemp-Welch. The Americans defeated this team in an international match held in New York City by a score of 3 to 2, but Simpson and Bruce carried off the U. S. doubles title. C. C. Pell saved the singles crown for the United States by conquering Bruce in the final contest. Stanley G. Mortimer, of the United States, defeated Bruce in the final of the classic Gold Racquet Tournament after a thrilling match. The United States national squash-racquets championship was won by Herbert N. Rawlings, of New York City, who defeated Myles P. Baker, of Boston, the defending

title holder, in the final round. The United States team successfully defended the Lapham Trophy in an international match with Canada.

The court tennis season was signalized by the crowning of a new world champion in the person of Pierre Etchebaster, of France, who triumphed over George F. Covey, of England, long supreme in this field of sports, in a challenge match contested at London. Etchebaster previously had visited the United States and taken away the professional title from Jock Soutar, of Philadelphia. The United States national title went to Hewitt Morgan, of New York, while Jay Gould and William C. Wright retained their national doubles championship.

RADCLIFFE COLLEGE. A non-sectarian college for women at Cambridge, Mass., founded in 1879. The enrollment for the autumn of 1928 was 1109, distributed as follows: regular students, 761; graduates, 323; special students, 25. Instruction was given to the students of the college by 215 teachers from Harvard University. The productive funds amounted to \$4,815,286, and the income for college purposes to \$477,691. The library contained approximately 65,000 volumes, exclusive of pamphlets. President, Ada Louise Comstock, A.M., Litt.D., L.H.D., LL.D.

RADIO TELEPHONY AND BROADCASTING. Probably the most important advance in the general field of broadcasting was the inauguration of the re-allocation plan of the 6169 stations in 1928 operating in the United States. This shifting in frequency of the stations was undertaken by the Radio Commission under order of the 1928 Radio Act. The reassignment was worked out in accordance with engineering principles, each of the five zones created by the Act receiving an equal number of channels; some of these channels are rated for "Rural Service" and are allowed high-power stations (up to 25 KW and experimentally up to 5 KW), others are "regional" and still others are "local service," the latter being limited to 100 watts and the regional to 1000 watts. The entire scheme of channel assignments was carried out with the idea of eliminating the well-known whistling interference.

In general, the radio listeners were well pleased with the new plan, most reports being to the effect that conditions are much improved. The General Electric Station, WGY, was, however, so disgruntled by its new assignment that the owners decided to test the legality of the ruling of the Radio Commission and had taken their case to the courts for adjudication.

This year saw the almost universal adoption of crystal controlled transmitters, that is, transmitters which had their frequency set by a small piece of piezo electric quartz. Such a control scheme is vital to the success of the Commission's re-allocation plan, as this calls for strict adherence to the station's specified frequency. Stations departing appreciably from their assigned frequency would have their licences revoked by the Commission.

As an aid to air navigation, radio showed two advances for the year. Accurate and frequent (every hour) weather reports were being sent over most of the eastern airways, so that a pilot knows, without inquiring, just what kind of weather he is heading into. A radio beacon system, having a visually operating indicator in the plane, enables an aviator to keep his plane headed straight for his landing field.

Transatlantic telephony expanded its range and volume; and any telephone subscriber in the United States could talk to a subscriber in nearly any part of Europe; as a special ocean cable was being built, over which it is expected that transatlantic telephony can be carried, it seemed questionable in 1928 whether the radio telephone link would be much more developed.

The Columbia Broadcasting Company further established itself as a competitor to the National Broadcasting Company (the Radio Corporation chain) by acquiring station WABC, which, on a clear channel with full-time operation, will be its key station.

The broadcast-receiver was greatly improved by the practically universal adoption of 60-cycle-power operation; tubes using alternating current for filament heating were used for all amplifiers, and a special "heater" tube was used for detector. To get an output free from distortion, the better sets use a push-pull output stage, the tubes in this stage being power tubes using up to 400 volts in the plate circuit, with a useful output of several watts.

The moving coil, or so-called "dynamic," speaker was finding universal adoption, primarily because of its better response in the frequencies below about 100 vibrations per second. The average efficiency of such a speaker, arranged with suitable baffle board, is about 5 per cent, which is several times as good as that of the older cone-type speaker using the rocking armature motor.

RADIO TELEGRAPHY. In the field of radio telegraphy, the world-wide network of the Radio Corporation of America was expanded by new links, notably San Francisco to Shanghai (via Manila) and New York to Venezuela. Their channels in 1928 reached to Great Britain, Norway, Germany, Poland, France, Italy, Sweden, Argentina, Brazil, Dutch West Indies, Dutch Guiana, Porto Rico, Turkey, French Indo-China, and some other countries. The greatest activity in radio telegraphy was in the study and application of short waves, especially those shorter than 50 meters. The engineers of the Bell Telephone Laboratories were responsible for most of our increased knowledge of the action of these short waves, many excellent theoretical and experimental papers having come from these researchers. It was found, by oscillograph records, that these short waves actually do travel all the way around the world, many measurements yielding the time necessary for the circuit, on a great circle, as about .14 second. This corresponds closely to the velocity of light waves. On one occasion, a 15.6-meter wave was pictured after having gone around the world twice.

There was much activity in directional radio in the short-wave channels; Great Britain especially has been putting into service stations having a kind of parabolic system of antennas at both receiving and sending stations. This type of station is said to cut down the amount of required power to only a few per cent of that required with non-directional antennas.

It appeared that there was to be considerable application of short-wave, directive stations in the United States for "point to point" communication. Of the 600 short-wave channels available, the Radio Commission granted over 300 to three of the commercial communicating companies and the press, these all to be fixed stations, and about 150 licenses were granted for short-wave mobile stations (marine and aircraft). The total requests for short-wave channels sent in to the Commission numbered over 2200.

TELEVISION. In television, but little progress has been apparent during the year. The only development of note was the application by the Bell Laboratories' engineers, of some new photo-electric cells, larger and much more sensitive than those previously used. By their aid, outdoor scenes, having natural illumination, have been sent by the television apparatus used in their first experiments. Other engineers working on the television problem frequently announced to the newspapers great accomplishments, but the apparatus generally proved to be only an emasculated form of the apparatus used by the Bell Laboratories' research men. It seemed that the home television set, which would give pictures worth looking at, was still in the distant future.

RADITCH, rā'ditch, STEPHEN. Leader of the Croatian Peasant party, in Jugo-Slavia, died at Zagreb, August 8, as the result of a bullet wound inflicted by a representative of a Serbian radical district, during a session of the Jugo-Slavic Parliament, June 20. Raditch was born of a peasant family at Trebarjevo, Croatia, June 11, 1871 and attained an education in spite of severe poverty. As he understood his country's subjection to Austria-Hungary, he became vehement in his opposition to the Ban, or governor, appointed from Budapest, and, while still in his teens, he organized political student groups in the hope that he and his followers might some day achieve Croatian autonomy. Such youthful activity brought him into conflict with officials of school and government, and he already had been once expelled and twice arrested when he received his degree in classics from the college at Rakovac in 1891. He continued a tempestuous existence, traveling without funds throughout Jugo-Slavia and into Germany and Russia, observing the relations between people and governments. After teaching Russian and Croatian at Prague, he became involved in an insurgent movement which found expression on Oct. 16, 1895, when the students of Zabred University publicly burned a Hungarian flag. The following month Raditch was imprisoned as the leader of the insurgents. During his confinement he learned the Czech language, and, having been released in June, 1926, he set out for Russia with the intention of entering the law school at the University of Moscow. He found, however, that the course was too expensive, so, having been excluded from the universities of Zabred, Prague, and Budapest, and from all countries represented at the Vienna Parliament, he went to Paris to attend the École Politique, from which he was graduated in 1898. He returned to Prague the following year, and, besides working on the editorial staff of the *Independence*, he wrote many political articles.

In the election to the Hungarian Diet in the autumn of 1901, Raditch favored the opposition party, becoming secretary of the Union of

Croatian Opposition. Raditch was working for Croatian autonomy, and, placing his hope in the peasants, he published from 1903-04, the *Croatian Thought*, with the purpose of enlisting the intellectuals on the side of the majority class. On Dec. 22, 1904, Raditch presided at the meeting for the formation of a Croatian Peasant party. On May 28, 1910, a new franchise law was passed, which secured the vote of 16,000 peasants. During the World War, from 1914 until 1918, the Peasant party was pacifist, and Raditch even favored the Entente powers. When Bulgaria expressed herself ready to withdraw her troops from the Central powers, the Peasant party declared itself republican, in July, 1918. In the autumn of that year, the Austro-Hungarian Empire dissolved, and a revolutionary assembly of party leaders met at Zabred. Raditch, who had been elected to the new Government, failed to establish Croatian autonomy, and he opposed the committee which in November, 1918, surrendered to the Serbian Nationalists in order to secure the protection of the Serbian Army. A provincial government ruled until, in 1920, a committee was elected to draft a constitution for the United Kingdom. The Croatian Peasant party returned fifty members, but they refused to cooperate in the writing of the constitution.

Raditch believed that Jugo-Slavic unity was established, but that cultural differences between the Croats and Serbs and Slovenes made local independence essential, and, being in sympathy with the peasants, he advocated an immediate settlement of land disputes. Realizing that his purpose could not be accomplished without compromise, Raditch came to an agreement with the Belgrade authorities on Mar. 27, 1925, and the Peasant party officially recognized the Serbian dynasty, and the Jugo-Slavic constitution, in which its leaders had formerly refused to participate. The Croatian Peasant party and the Radical Serb party came to terms on July 14, providing that Serbian, Croatian, and Slovene citizens should have equal rights under the central Government, and that each commune should be autonomous. Six days later the Nettuno agreements were signed with Italy, but they roused such opposition in the Peasant party, and with the public, that the Belgrade authorities were unable to pass them through the legislature. Raditch became minister of education on November 18 of the same year, and although he was retired in the spring of 1926, he retained control of the cabinet through his followers until Feb. 1, 1927, when the Slovene clericals came into the majority. He was returned Sept. 11, 1927, and until his death he held nearly all legislation in abeyance by his opposition to Serbian measures, particularly the Nettuno agreements.

RADIUM. During 1928 but little radium ore was mined in the United States and no radium was reported isolated, the world market being supplied with radium from ores mined in the Belgian Congo. This product was the dominating feature of the radium situation. In Utah, a few tons of carnotite were mined and also in New Mexico small quantities of other ores were produced, all of which were utilized in therapeutic preparations. The Union Miniere du Haut-Katanga, controlling the Belgian Congo supply, reported that in the fiscal year ended June 30, 1928, it had sold 26 grams of radium produced from Belgian Congo ores. The retail price during

the year was stated at about \$70,000 per gram. The Soviet Government was also a producer reporting about 6 grams from various places, working the radium ores from Ferghana, a province of Russian Turkestan. In Czechoslovakia, ores mined at Jachymov, Joachimsthal, continued to be treated by the Government. During the year, attention was called to a number of deaths among workers in plants, in the United States, where radium ores and mesothorium were handled in making luminescent watch and clock dials and house numbers. The surgeon general of the Public Health Service toward the end of the year called a conference to consider the connection between radioactive substances and health, but no report had been prepared by the end of December. Radioactive salves, drinking-water, and pads continued to be manufactured. See also under **CHEMISTRY, INDUSTRIAL**.

INDUSTRIAL POISONING BY RADIUM. The daily press during 1928 contained many references to poisoning of workers in manufacturing plants which make use of radium and of damage suits resulting therefrom; but the scientific status of the problem was unsettled. In December, Surgeon General Cumming, of the Public Health Service, called a conference for the purpose of determining the best method of dealing with the problem. Seventy-five scientists and industrialists attended the conference which was held at Washington, D. C., Dec. 20, and the interest centered in the medical history of all of those in the country who have worked at luminous dial painting. In these subjects the individual resistance to radium poisoning differs within wide limits and it is possible that a certain standard of robustness will eliminate the danger of poisoning. Elimination of risk by a better technic, such as prohibition of wetting the paint brush with the lips, should greatly aid in the campaign, although Dr. E. Steward, Commissioner of Labor Statistics, favored complete abolition of radium in all industry. Dr. Drinker, of Harvard, who had inspected certain radium plants where poisoning had occurred, found that some of the victims had not used paint brushes at all; among the fatalities were cases in chemists and a superintendent. Injurious effects could supervene long after the period of actual exposure. See **CHEMISTRY, INDUSTRIAL**.

RAI, LALA LAJPAT. Indian Nationalist leader, died at Lahore, India, November 17. He was active in nationalistic propaganda to undermine the British domination while the Earl of Minto was viceroy, and, in 1907, he was deported for increasing the widespread unrest. Living in America, he wrote extensively on the political problems of India. After the World War he returned to India, and became an influential follower of Gandhi. As leader of the Nationalist party in the Indian legislative assembly, he continued to work against British intervention, coming into frequent conflict with the authorities. He was arrested in 1921, on the charge of conducting a seditious political meeting. In the month before his death, he led a demonstration against the Simon commission, which was to investigate statutory reform.

RAILWAY ACCIDENTS. During 1927, the number of persons killed in railway accidents in the United States was 6821, as compared with 7090 in 1926, while the number injured was 104,799, as compared with 130,235 in 1926, according to the report contained in *Accident Bulletin*

No. 96, issued by the Interstate Commerce Commission, in 1928. Of the total number killed in train accidents, 286, and of those injured, 3,072, there were 194 railroad employees killed while on duty and 1211 injured. The total number of accidents, from collision, derailment, or other causes, was 18,976, and these resulted in damage to property totaling \$20,765,698. It was reported that of the 236,283 highway crossings on the railroads of the United States, Dec. 31, 1927, 207,559 were unprotected.

RAILWAY ACCIDENTS BY GROUPS

Group of accidents	Year ended Dec. 31, 1927		Injured
	Number of accidents	Number of casualties	
Train accidents	18,975	286	3,072
Train-service accidents	42,327	6,096	39,531
Non-train accidents	(a)	439	62,196
Total	(a)	6,821	104,799
Group of accidents	Year ended Dec. 31, 1928		Injured
	Number of accidents	Number of casualties	
Train accidents	21,077	360	3,916
Train-service accidents	48,504	6,329	45,733
Non-train accidents	(a)	401	80,586
Total	(a)	7,090	130,235

According to the director of the Bureau of Railway Economics, there was approximately a 10 per cent decrease of deaths over 1927 in the first eight months of 1928, and approximately a 20 per cent decrease of injuries.

One of the most serious accidents in the United States was that on the Interborough Rapid Transit subway, when seventeen persons were killed on August 24 as two cars were derailed during rush hour by a faulty switch.

In Great Britain, there were more lives lost in railway accidents in 1928 than in any year since 1915. Fourteen persons were killed on October 13 at Charfield, Gloucestershire. Twenty-five passengers were killed at Darlington on June 27 when the engineer of a freight train mistook signals at a switch, and ran head-on into an excursion train, causing a passenger coach to be telescoped. The accident aroused discussion in the Ministry of Transport as to the advisability of all-steel coaches, the efficiency of automatic train control, and the means of preventing telescoping.

The most disastrous accident of the year occurred on October 26, when the Simplon-Orient express collided with a Bucharest train, killing thirty-four persons, including every passenger in two sleeping coaches which were telescoped. Sixteen persons were killed when a trainman mistook signals on the Northern Railway of France, outside the Paris terminal, on April 11. A Budapest express, receiving false signals, was wrecked in Czechoslovakia, and twenty persons killed, on September 10.

RAILWAYS. Argument was begun before the Supreme Court of the United States on Jan. 3, 1929, in the so-called St. Louis & O'Fallon case. This case indirectly affected the earning power of railroad property estimated to be worth \$18,900,000,000 or more. It involved the method adopted by the Interstate Commerce Commission in valuing railroad property. Under the Transportation Act of 1920 the Interstate Commerce Commission was empowered to make a valuation of property of railways employed in rendering transportation service and was required to fix such rates

for passengers and freight as would yield the railway companies a fair return on the capital found to be invested in the physical property, after the payment of expenses and taxes. Under the Transportation Act the Government was empowered to recapture one-half of all railroad earnings in excess of 6 per cent.

The Interstate Commerce Commission used the prices of 1914 as a basis for valuation of the railroad properties. The railway companies claimed that this was not a fair present value. The whole question was immensely complicated because the present value of railroad property was determined by the rates which railroads were allowed by the Interstate Commerce Commission to charge for transportation. It would seem simple to determine with a fair degree of accuracy the actual investment which had been made in railways and to allow such rates as would yield a fair return after the payment of expenses on this valuation; but in practice it was found quite impossible to arrive at the actual historical cost of the railways and, therefore, the commission made an attempt to determine what it would cost to build the railways of the country to-day, but in arriving at this cost the commission used the prices of 1914 for both labor and materials. Since these prices were considerably below the prices that labor and materials command today the valuation as arrived at by the commission was, according to the railway companies' lawyers, too low.

There was another question involved in the St. Louis & O'Fallon case which the court was called upon to decide. There were two railway lines involved in the case, one the St. Louis & O'Fallon Railway Company and the other the Manufacturers' Railway Company. The railway companies contended that the Transportation Act of 1920 contemplated the consolidation of various railway companies' properties and that a fair return could legally be earned on the aggregate value of the properties. The commission contended that a fair return and only a fair return should be allowed to each separate company and that the averaging of the two values was not in accordance with the Transportation Act.

The railways were not only faced with the problem of convincing the Supreme Court of the United States, and this really meant the public opinion of the United States, that they were entitled to charge rates for the carriage of passengers and freight which would yield a fair return on what they contended was the true value of the property used for transportation services, but they also, in 1928 as never before, had to meet competition in service from airplanes and from motor trucks using public highways. Even given a right of way constructed by the State or the Federal Government, motor trucks cannot render freight or passenger service at as low a cost as steam railways for distances over 100 miles; but they can render service which for the moment at least was more satisfactory to the public than the service rendered by railways. The consequence was that the steam railways were losing both freight and passenger business in competition with motor trucks. Nevertheless, through economies of operation, the railroad managements were able to make a better showing in 1928 than they had in 1927. In the first ten months of 1928, total operating expenses were \$133,000,000 less than in the corresponding period of 1927; \$174,000,000 less than in the first ten months of 1926

and \$408,000,000 less than in 1923. Transportation expenses, which are the out-of-pocket cost of moving freight and passenger business, were \$65,600,000 less than in 1927 and \$226,000,000 less than in 1923. Motor transport competition also figured in Great Britain. See GREAT BRITAIN.

The total net operating income of the Class 1 (companies earning a million dollars a year or more each) roads in the first ten months of the year 1928 was \$986,000,000, or at the annual rate of 4.73 per cent on their property investment.

In a review of railway operations in 1928 written by Julius H. Parmelee, Director of the Bureau of Railway Economics for the Annual Statistical Number of the *Railway Age*, Mr. Parmelee says:

Freight traffic for the year was almost exactly the same as in 1927. The traffic for the first six months was about 4 per cent below that of the corresponding period of 1927, while the traffic of the second six months was about 4 per cent above 1927. Passenger traffic declined in every month of 1928, the decrease for the year being about 6 per cent. The freight traffic's story falls into two distinct periods of six months each from January to June, both car loadings and ton-miles ran consistently below the corresponding months of 1927 while from July to the end of the year they ran as consistently ahead. As the result the totals for the year are almost the same as in 1927.

The total passenger miles (a passenger mile is one passenger carried one mile, or two passengers carried a half-mile each, etc.) in 1928 amounted to 31,500,000,000 and in 1927 to 33,655,000,000. This again is for Class 1 railroads and is based by Mr. Parmelee upon reports of the Interstate Commerce Commission and include revenue movement only.

One of the means which the steam railways adopted to meet competition by other methods of transportation was the development especially important in 1928 of joint air-rail routes. The first air-rail route to be put into actual operation was the service between Chicago and the Twin Cities (St. Paul and Minneapolis). The Northwest Airways Company operating this service had an agreement with the Great Northern Railroad, the Northern Pacific Railway and the Chicago, Milwaukee, St. Paul & Pacific Railway whereby passengers may use the airplane service between Chicago and the Twin Cities as part of their journey from the East to the Northwest or from the Northwest to the East. The Pennsylvania Railroad, the National Air Transport Company, and the Atchison, Topeka & Santa Fe made arrangements for passengers taking the trip from New York to Los Angeles to travel by rail (on the Pennsylvania) from New York to Columbus, Ohio, thence by airplane to Dodge City, Kansas, and thence by rail again to a point in New Mexico where they again would take airplane to Los Angeles.

The New York Central provided passenger service permitting the traveler to go by rail from New York to Cleveland and by airplane from there to Chicago. The Pan American Airways operating between Miami, Florida, and Havana, Cuba, made traffic arrangements with the Chicago-Florida lines and the New York-Florida lines in conjunction with the Florida East Coast Railway whereby passengers from New York or Chicago or intermediate points might use the airplane service between Miami and Havana. The Illinois Central had traffic arrangements with the Chicago-St. Louis air lines whereby round-trip tickets between these points were sold which were good by rail one way and by air the other.

To meet competition in freight service, the railways improved their freight service very much. They reduced their schedules of freight trains and improved on the time performance of these schedules. Among typical examples was ninth-morning delivery of freight originating at Chicago destined for Los Angeles and San Francisco, a reduction of the schedule by twenty-four hours. The time from Chicago to Denver was reduced to 10½ hours. From St. Louis to Denver the time had been reduced from 77½ hours to 67 hours. From Kansas City to Denver the time was reduced on freight from 55½ hours to 44½ hours. The through freight from Chicago to Omaha is run on a 24-hour-and-10-minute schedule saving 24 hours in delivery at Omaha on freight originating east of Chicago and received before 5 A. M. at Chicago, a saving of 24 hours to Seattle, Tacoma, Portland, and other northwestern points, making it possible for eighth-morning delivery instead of ninth-morning delivery. The Great Northern and the Chicago, Burlington & Quincy provided freight service which gives ninth-morning delivery from Seattle, Tacoma, and Portland to Fort Worth, Texas, saving 24 hours. The lines running between St. Louis and the Twin Cities now make second-morning delivery of freight as compared with third-morning delivery heretofore.

The Chicago & Eastern Illinois and the St. Louis-San Francisco provided a new schedule of second-morning delivery of freight from Chicago to Springfield, Joplin, Mo., and Tulsa, Oklahoma, instead of third-morning delivery. The Chicago & Eastern Illinois reduced the running time of its manifest trains from Chicago to southeastern connections at Evansville, Indiana, Chaffee, Missouri, and Thebes, Ill., from two to four hours each. The Illinois Central reduced the schedule of its Chicago, Birmingham, Alabama, and Chicago, Martin, Tennessee, trains so as to provide a saving of 24 hours to Florida and other southeastern destinations.

The possibilities for more commodious and luxurious passenger accommodations on trains than on automobiles was widely advertised. Attractive rates were being offered to counteract to some extent the rates offered by motor-coach lines. As one of the principal sources of the loss of traffic was in day-coach travel, every effort was made to render this service more attractive.

Surprising as it may seem, more mileage of steam railroads was built in 1928 than in 1927. The *Railway Age* compilation of miles of new line completed in the United States since 1893 shows that 1025 miles (road-miles) were completed in 1928 as compared with 779 miles completed in 1927. In part offsetting this new mileage built, the mileage of lines abandoned in the United States in 1928 was 512 as compared with 282 abandoned in 1927. The lines abandoned in 1928 include 80 miles in Nevada, 40 miles in California, 40 miles of branch lines in Tennessee, and 68 miles of branch line in Ohio.

CARS ORDERED IN 1928. The *Railway Age* made a compilation of the orders given for railroad equipment during the year and estimated that orders were placed for 51,200 freight cars for service in the United States during 1928 as compared with orders for 72,006 freight cars for service in the United States in 1927. The number of passenger cars ordered for service in the United States in 1928 was 1930 comparing with 1612 ordered in 1927. The number of locomotives or-

dered for service in the United States was 603; for service in Canada, 98; and for export to other countries, 27. This compared with 734 ordered for service in the United States in 1927; 58 for service in Canada in 1927; and 54 for export. The number of cars and locomotives ordered and the number built should not be confused. The number of freight cars built in the shops in the United States was 46,998 in 1928 comparing with 64,477 built in 1927. Of those built in 1928, 938 were for foreign use and 46,060 were for domestic use. Of those built in 1927, 1087 were for foreign use and 63,390 for domestic use.

CONSOLIDATIONS. On Apr. 13, 1928, majority and minority reports on the revised Parker Bill for the consolidation of railroads were presented in the House of Representatives by the House Interstate Commerce Committee. Senator Fess, of Ohio, on Dec. 19, 1928, introduced in the Senate a revised railroad consolidation bill to take the place of the bill he had introduced at the previous session. The new bill was made up of the text of the Parker Bill with several amendments proposed by the representatives of the Association of Railway Executives. One amendment would remove the prohibition against the acquisition by one carrier of securities of another in an amount not sufficient to constitute control, but with the provision that such shares shall not be voted on any question relating to unification without the approval of the Interstate Commerce Commission. Another amendment provided that the holders of voting securities shall be held to have consented to a unification plan if a majority of the votes of stockholders are cast in favor of the plan. Unless in the case of bondholders having a vote, the trustee shall file a certificate showing that the holders of a majority of the bonds dissent.

In the majority report on the Parker Bill it was said that "the time has come when the temporary provisions of the present law must be repealed and termination provisions substituted therefore which are adequate to protect and promote the interests of the public, which are reasonably certain and possible of administration and under which the established policy can be carried out." The primary purpose of the bill was to limit the defects of the existing law in order that the established policy of permitting the voluntary unification of the railroads and their properties may be carried out, but only if in each case the Interstate Commerce Commission has determined that the proposed unification will promote the public interest. The bill provided that only unifications which will effectively promote the public interest may be authorized and it affords the carriers more flexible methods for carrying into effect a proposed unification which has been approved by the Commission. The proposed unification may be carried out through corporation merger, a corporate consolidation under State law, an acquisition of control through stock ownership or an acquisition of properties by purchase, lease or otherwise. The requirement that the Interstate Commerce Commission first establish a plan for consolidation is repealed. Protection is given dissenting stockholders by compelling the payment in cash to those who do not desire to remain stockholders. Stock may be acquired by condemnation.

The Bill, Section 214, provides:

That no tax shall be levied or collected under any revenue law of the United States or by or under the authority of any state or any political sub-division

thereof in respect to any issue, sale, delivery or transfer of any security, or any agreement to sell or memorandum sale of any security if in pursuance of an order of the Commission under this title approving a plan. Gain from the sale or other disposition of the property or economy from any distribution in connection with such unification shall not be subject to tax by or under the authority of any state or any political sub-division thereof except to the extent that money is received from time to time from such sale, disposition, or distribution. Any such unification shall be held to be a reorganization within the meaning of that term as used in Part 1 of Title 2 of the Revenue Act of 1926.

Regulation of interstate passenger motor-bus traffic which the original Parker Bill placed in the hands of joint commissions comprising representatives of the highway courts of the various States through which the lines traveled is vested in the Interstate Commerce Commission by the amended measure. The original bill merely designated the Interstate Commerce Commission as a court of appeal from the decisions of the proposed joint regulatory courts.

During 1928, no important proposals for consolidation of railroads were brought before the Interstate Commerce Commission.

RECEIVERSHIPS AND FORECLOSURE SALES. The compilation of railroad mileage in the hands of receivers and of receiverships, made by the *Railway Age*, gave 5352 miles as the number of road-miles operated by receivers in 1928. Only one road, the White River, a 19-mile line in Vermont, was placed in receivership during 1928. In all, thirty-four different companies owned the 5352 miles of railroad which were in receivership during 1928.

The Chicago, Milwaukee & St. Paul was reorganized during 1928 as the Chicago, Milwaukee, St. Paul & Pacific. As might have been expected, the earnings of the company showed improvement as soon as the purposes of the receivership had been accomplished. Total operating revenues Jan. 1 to Oct. 31, 1928, were \$138,451,658 as against total operating revenues, for the corresponding period of 1927, of \$136,555,779. Operating expenses, however, for Jan. 1 to Oct. 31, 1928, were \$101,142,806 and for the corresponding period in 1927, \$111,562,785. Net, after deducting expenses, rentals, and taxes, amounted to \$24,497,627 Jan. 1, 1928 to Oct. 31, 1928, and for the corresponding period in 1927 to \$12,063,224. The road mileage traveled was 11,251 in 1928 and 11,204 in 1927. Thus, with a somewhat larger mileage traveled, there was a slightly larger gross in 1928 than in 1927 and very much smaller expenses.

DIVIDEND CHANGES. The New York, New Haven & Hartford declared the first dividend on the common stock since 1913 and paid a special dividend of \$1 per share to stockholders of record at the close of business on March 9. In August, the directors again declared a special dividend of \$1 per share to stockholders of record September 10, and in November a special dividend of \$1 was declared to stockholders of record December 7, making a total disbursement for the year of \$3 per share. In April, the directors of the Atchison, Topeka & Santa Fe raised the regular quarterly rate of dividends on the common stock from 1¾ per cent to 2½ per cent, thus officially recognizing the fact that the Atchison, Topeka & Santa Fe common stock was on a 10 per cent annual dividend basis. An extra dividend on the common stock of the Chicago & North Western of one-half of 1 per cent was declared in addition to the regular 2 per cent semi-annual

dividends at the November, 1928, meeting of the Board of Directors. The Chicago, Rock Island & Pacific directors placed the common stock on a 6 per cent annual basis by raising the quarterly dividend from $1\frac{1}{4}$ per cent to $1\frac{1}{2}$ per cent. An initial quarterly dividend of $1\frac{1}{4}$ per cent on the 5 per cent preferred stock of the Missouri Pacific Company was declared payable to holders of record Dec. 15, 1928. At the same time an extra dividend of $1\frac{1}{2}$ per cent was declared to apply on the back dividends of this stock which had been cumulative since 1918. The Texas & Pacific declared an initial dividend of $1\frac{1}{4}$ per cent quarterly to holders of record May 31, placing the stock on a 5 per cent annual basis. Directors of the Norfolk Southern declared a semi-annual dividend of $\frac{1}{4}$ per cent to stockholders of record December 20 and an extra dividend of 1 per cent was declared at the same time. The directors of the Rutland Railroad declared a dividend of 1 per cent on the outstanding 7 per cent cumulative preferred stock to stockholders of record November 30. This was the first payment on this cumulative preferred stock since the payment of 1 per cent which was made in January, 1927.

The directors of the Wheeling & Lake Erie declared a dividend of 7 per cent on the prior lien stock of the company, to stockholders of record October 25. This was the first payment on this stock which was issued in the reorganization of the company in 1916. The stock was cumulative and its holders were entitled to elect a majority of the directors while dividend payments remain five years or more in arrears. The directors of the Alabama Great Southern, which company was affiliated with the Southern Railway, declared an extra dividend of 3 per cent on both the common and preferred stock in addition to the regular 4 per cent semi-annual dividends on both issues. The two extra dividends of 3 per cent in 1928 compare with two each of $3\frac{1}{2}$ per cent in 1927. The directors of the Kansas City, Oklahoma & Gulf declared an initial dividend of \$3 per share to stockholders of record July 23, 1928, on the company's Series A, 6 per cent preferred stock.

The directors of the Long Island Railroad declared a dividend of 4 per cent on the stock, nearly all of which was held by the Pennsylvania. This was the first dividend on the stock of the Long Island since 1896. The directors of the Mobile & Ohio declared an extra dividend of 5 per cent in addition to the regular semi-annual dividends of $3\frac{1}{2}$ per cent. This compares with an extra dividend of 3 per cent declared in December, 1927. The directors of the West Jersey & Seashore declared a dividend of $2\frac{1}{2}$ per cent to stockholders of record March 15 and in September a second semi-annual dividend of $2\frac{1}{2}$ per cent was declared.

SIGNALS. According to the *Railway Age* compilation, automatic block signals were completed on 3121 miles of road during 1928 which mileage exceeds the annual average for the past 10 years by 752 miles, but compares with 5127 miles of road equipped with automatic block signals in 1927. There were 126 new interlocking plants completed in 1928 compared with 142 completed in 1927. On the 3121 miles of road equipped with automatic block signals in 1928, 5536 signal units were installed. The Interstate Commerce Commission issued a report on Nov. 26, 1928, saying in effect that a far greater measure of safety was

to be expected from vigorous efforts to provide adequate protection against the large number of accidents that arise from causes other than the disregard of fixed signals than from requiring by order special efforts to extend automatic train-control installations. The Commission did not order any further installations of train-stop or other train-control devices. The Pennsylvania Railroad, at the end of 1928, had under construction the installation of locomotive cab signals without automatic control of the brakes of 225 locomotives operating on 81 road-miles, comprising 327 track-miles. The wayside automatic signals on this line are to be continued.

RAILROAD SECURITIES. The total sales of railroad securities in the first eleven months of 1928 was \$746,724,000 (par value) as compared with more than \$900,000,000 in the full year 1927. This tabulation was made by the *Wall Street Journal*. Of the total par value of railroad securities sold, 25 per cent was stock, 64 per cent, bonds, and 11 per cent, equipment trust certificates. This compares with 21 per cent of the total in 1927 in stock, 70 per cent, bonds, and 9 per cent, equipment trust certificates. The Interstate Commerce Commission had favored competitive bidding for railroad securities and, in its annual report for 1927 made public in 1928, pointed to a steady decrease in the spread between the cost of funds to the railroads and the interest yield to the public. In 1928, however, a railroad invited bids from sixty bankers on an equipment trust issue (the commission had expressed the opinion that equipment trust issues were particularly well adapted for competitive bidding) and only three bids resulted, all of which were rejected. The highest of these bids was 97.25 per cent. The road, after rejecting the bids, sold the issue to its regular banker for 98.25 per cent. The Pennsylvania Railroad sold \$17,500,000 stock to officers and employees and \$62,408,250 par value stock to stockholders. The St. Louis-San Francisco offered \$49,157,400, 6 per cent preferred stock to its common stockholders. The New York Central sold \$42,158,300 capital stock (it has no preferred stock) to stockholders and the proceeds were used to retire bonds. The Atchison, Topeka & Santa Fe offered to stockholders the right to subscribe to \$30,204,000 par value convertible debentures and was authorized by the Interstate Commerce Commission to issue \$18,122,400 common stock to be exchanged for bonds which may be offered for conversion.

The Interstate Commerce Commission disapproved of the issue to stockholders at par of stock by the Chesapeake & Ohio. The commission expressed the desire that the Chesapeake & Ohio stock, which was paying 10 per cent and was quoted on the New York Stock Exchange Jan. 6, 1929, as closing at 219 $\frac{1}{4}$, be offered to stockholders at 150. The railroad company re-submitted its case.

The St. Louis-San Francisco sold through Speyer & Company, J. & W. Seligman & Company, and the Guaranty Trust Company \$100,000,000, par value, of $4\frac{1}{2}$ per cent Series A Consolidated Mortgage bonds due 1978 to the public at a price of 97. The Pennsylvania Company sold through Kuhn, Loeb & Company, \$50,000,000 of $4\frac{1}{4}$ per cent Secured Mortgage bonds due 1963, at a price to the public of 99. The Southern Pacific sold \$29,400,000 of $4\frac{1}{2}$ per cent bonds due 1968 at 99 $\frac{3}{4}$ to the public, yielding to maturity 4.52 per cent. This compares with the Penn-

sylvania Company bonds yielding 4.81 per cent to maturity. The Union Pacific sold, through Kuhn, Loeb & Company, \$20,000,000 of 4 per cent bonds due 1968 at a price to the public of 92¾, yielding 4.38 per cent, and the Alabama Great Southern sold \$5,206,000 per value of First Mortgage Series B bonds due 1943 through J. P. Morgan & Company, the First National Bank, and the National City Company, to the public at a price of 98½ yielding 4.15 per cent. The Wabash sold \$17,867,000, par value of 4½ per cent Refunding and General Mortgage Series C bonds, due 1978, at 93 to Kuhn, Loeb & Company, who offered them to the public at 95½. The yield to the bankers was 4.875 per cent and to the public 4.74 per cent.

See ELECTRIC RAILWAYS; FINANCIAL REVIEW; RAILWAY ACCIDENTS; RAPID TRANSIT TUNNELS. **RAILWAYS, ELECTRIC.** See ELECTRIC RAILWAYS.

RAPID TRANSIT. NEW YORK CITY. The work of the Board of Transportation of New York City in the construction of the several works which it had under way, described in the 1927 YEAR BOOK, progressed satisfactorily during the year. The principal portion of the new construction was the line extending from the upper end of Manhattan Island, along Broadway, Fort Washington Avenue, St. Nicholas Avenue, Eighth Avenue, Central Park West, lower Eighth Avenue, Greenwich Avenue, Sixth Avenue, Church and Fulton Streets, Manhattan, thence under the East River to Cranberry, High, and Jay Streets, Brooklyn. This line involved several novel features of design, a double-deck section in certain sections as well as difficult crossings of older construction, but it was carried forward rapidly and without serious difficulty. A considerable portion was complete with street surfaces restored at the end of the year. The details of the construction methods employed, with little interruption of street traffic as compared with the great open cuts of the original New York subway, are an interesting example of modern methods and problems of excavation. The design, on the other hand, shows how wisely the original subway project was worked out, for the new work follows exactly the same steel-beam-and-jack arch type of construction.

The cross-connection between this north and south route at Fifty-third Street also made good progress. Beginning at Eighth Avenue, where transfer will be made, the line runs eastward under the East River and Welfare (formerly Blackwell's) Island to Long Island City. One of its most important features is the tunnel under the East River. Two tubes are used, each 18¼-ft. diameter, at 30-ft. centres, and they were safely and rapidly constructed. At the close of the year they were practically excavated and awaiting only the official ceremony of "holing through." As these tubes passed through rock in large part, they were built both in part under normal atmospheric pressure and in part using compressed air. A central shaft on Welfare Island as well as construction shafts both at the Manhattan and the Queens approaches were used. The rapidity of this work is indicated by the fact that the contract was let in March, 1927.

The Fourteenth Street-Eastern subway in Brooklyn, representing 7¾ miles of route built at a cost of \$33,000,000, having been sufficiently advanced from its previous terminus, at Montrose and Bushwick Avenues, to the Broadway elevated

connection at Conway Street, was opened for service to East New York. Coincident with this opening, bids were called for to extend this line from its present Manhattan terminal in Fourteenth Street and Sixth Avenue, to Eighth Avenue where transfer can be made to the new Eighth Avenue line under construction.

The so-called Nassau Street loop, after years of discussion and some difficulty over letting the contract, was under construction. It was an extremely difficult piece of work and connects the Brooklyn-Manhattan Transit station under the Municipal Building in New York by a line extending down Nassau Street to Whitehall Street, to the present line and Montague Street Tunnel of the B. M. T. This would permit the Broadway (Brooklyn) line to be operated as a loop with the lower B. M. T. line and thus, it was hoped, speed up traffic. The work was being done in two sections, the first having been let early in 1928 and the second at the end of the year.

PHILADELPHIA SUBWAY. The first train passed through the new \$87,000,000 North Broad Street Subway on September 1. Twenty-three minutes after leaving the City Hall Station it arrived at the Olney Avenue terminal, six miles north. The work was begun four years previously and involved a four-track subway. It was expected that only the two local tracks would be used pending the completion of the South Broad Street section, from City Hall to South Street, under construction during the year. A three months' operating contract was made with the Philadelphia Rapid Transit Company for a rental of \$200,000 a month with a fare of 7½ cents. It was understood that the data secured on operating costs during this period would be used in making a longer contract. Indications are that there is to be considerable difficulty in reaching a decision on a final contract.

LONDON TUBE RECONSTRUCTION. The large number of passengers, some 25 million annually, using the important Piccadilly Circus station in the London "tubes" or underground railway, had made it clear that the time had arrived for a redesign of this station. It was one of the first of its kind in London and involved many features which were far from convenient judged by modern standards. The London Electric Railway Company therefore decided upon a thorough reconstruction of the accesses (passageways) and circulating areas (platforms, etc.) with the substitution of escalators for lifts (elevators) and with special attention to securing passageways which make it possible to avoid the dangers of the heavy street traffic for passengers by providing exits at various street points. The work was begun in 1925 and was to be opened early in 1929 at a cost of \$2,500,000. A large new "booking hall," elliptical in form and occupying some 15,000 square feet in the centre of the area, was covered by a spider-web arrangement of steel beams and was one of the main construction features of the design.

At Waterloo Station, due both to present traffic requirements and because of expected increases on account of the completion of the Kensington extension of the Hampstead line, a new triple escalator was built, by the Southern Railway Company. This work involved excavation deep in the London clay through which the London tubes are built.

TOKYO SUBWAY. The first city of the Orient to adopt the subway as a means of rapid transit

opened its first work late in December, 1927. Only $1\frac{1}{2}$ miles long and equipped with ten all-steel cars, this line, built like the New York subway, doubtless marks the beginning of such construction in the East. It connects two sections of Tokyo, Ueno and Asakusa, for which surface facilities had proved inadequate, and is privately owned.

RATHBONE, HENRY RIGGS. American lawyer and representative in Congress, died at Chicago, Ill., July 15. He was born at Washington, D. C., Feb. 12, 1870. His father, Maj. Henry R. Rathbone, was a special aide to President Lincoln on the night of Apr. 14, 1865, and was with the President when he was assassinated; Major Rathbone's fiancée, whom he subsequently married and who became the mother of Henry R. Rathbone, also was in the President's box in Ford's Theatre, Washington. Mr. Rathbone, who was a successful trial lawyer and a member-at-large of Congress from Illinois from 1923 until his death, was a noted collector and student of Lincolniana. He was graduated from Yale, 1892, and studied law at the Albany (N. Y.) Law School and the University of Wisconsin. From 1893 on he lived and practiced at Chicago. He was especially active in the national House of Representatives as sponsor of the proposed amendment to the United States Constitution to prohibit child labor.

RAYMOND, RÄMUND, E. T. See THOMPSON, EDWARD RAYMOND.

RAYMOND, ROBERT MATTHEW. American mining engineer and educator, died at Prescott, Ariz., August 23. He was born at Norton, New Brunswick, Canada, 1856, and having been graduated from the University of New Brunswick in 1877, he came to the United States and studied at the Columbia School of Mines receiving the degree of E.M., in 1889. He was superintendent of the Diamond R. Mining Company, of Montana, 1891-94, and then general manager of the Harquahala Gold Mining Company, of Arizona, until 1896. Receiving a similar position in the El Oro Mining and Railway Company, of El Oro, Mexico, in 1902, he supervised the organization of the first cyanide process plant in Mexico, which was so successful that it was considered a model. Professor Raymond became managing director of the El Oro Company and of the Exploration Company of England and America in 1908, continuing that work until 1916, when he returned to the United States and was appointed professor of mining at Columbia University.

RAYON. In 1928 the world's production of rayon was estimated at about 347,940,000 pounds distributed as shown in the accompanying table taken from the annual review number

of the *Textile World* (New York). It will be seen that in 1928 as in previous years the United States led in the world's production, but also it was quite apparent that rayon manufacture was quite generally distributed throughout the world. In fact, in addition to its own production, the United States imported during 1928 rayon valued at \$15,500,158, in which figured yarns, threads, and filaments to the amount of 12,742,418 pounds, valued at \$10,905,531.

The statistics on production for the rayon industry for the United States are given in the accompanying table, also from the *Textile World*, which shows comparative figures with earlier years as well as the production for 1928 and estimates for 1929. These statistics indicate that the industry was in the hands of large and efficient corporations and the increase in production and capacity since its establishment had been rapid and marked. On the technical side, the leading features of the rayon industry of 1928 were the development of yarns of subdued lustre, and the increased production of multifilament rayon. The leading consumers in 1928 were the manufacturers of underwear who were taking practically a third of the country's production. Next came the manufacturers of cotton goods who used rayon in combination with cotton yarns, accounting for some 20 per cent; the manufacturers of hosiery took a slightly less amount, with manufacturers of silk goods in fourth place, other industries absorbing the remainder of the production. The various consumers were calling for improved and finer yarns; and technical advances due to the research chemist and engineer continued. As discussed under **TEXTILE MANUFACTURING**, there were several new plants in course of erection during the year.

WORLD PRODUCTION OF RAYON BY COUNTRIES [From *Textile World*]

Country	1926 Lbs.	1927 Lbs.	1928 Lbs.
United States ..	62,575,000	75,050,000	97,700,000

At the biennial census of manufactures taken in 1928 by the U. S. Department of Commerce, the establishments engaged primarily in the production of rayon and allied products in 1927 reported, for that year, a total output valued at \$109,888,336, an increase of 24.8 per cent as compared with \$88,060,962 for 1925, the last preceding census year. The production in 1927 was made up as follows: Yarns, 75,555,439 pounds, valued at \$106,468,752; allied products (sheets, etc.), 2,053,204 pounds, valued at \$3,076,835; and waste, 2,985,390 pounds, valued at \$342,749. This industry classification embraced establishments engaged primarily in the production of rayon yarns and of allied products in the form of sheets, etc., but does not cover establishments manufacturing rayon yarns into finished products, such as textiles. Of the 19 establishments reporting for 1927, three each were located in New Jersey and New York, two each in Ohio, Pennsylvania, Tennessee, and Virginia, and one each in Connecticut, Delaware, Maryland, New Hampshire, and West Virginia.

The statistics for 1927 and 1925 are summarized in the accompanying statement. The figures for 1927 are preliminary and subject to such correction as may be found necessary after further examination of the returns.

The scope of the measure was one of the most stupendous ever passed. It provides for the construction at the Black Canyon site on the Colorado River of a dam nearly twice as high as any in existence. This would impound approximately 26,000,000 acre-feet of water, providing for the irrigation of wide expanses of land in seven States of the Colorado River Basin, and the development of approximately 1,000,000 horse power of electrical energy. In addition, the act provides for flood-control works to protect the Imperial Valley in southern California, and also for the construction of an all-American canal across southern California from the Colorado River to bring irrigating waters to the Imperial Valley. The valley was being irrigated by a canal branching off the Colorado River which runs through Mexican territory.

The measure provides for a Federal appropriation of \$165,000,000, estimated as necessary to construct the dam and accompanying works. The cost is to be repaid under an amortization plan from proceeds of the sale of power. On the basis of estimates, it was expected that the entire cost would be returned to the Government with interest within 50 years.

Before the measure can become effective, at least six States in the basin area must ratify the Colorado River compact; California, Colorado,

RAYS, RADIATION. See PHYSICS.

RECLAMATION. By far the most important event of the year in relation to reclamation was the passage by Congress and signature by the President of the Boulder Canyon Dam Bill, for the three-fold purpose of irrigation, flood control, and power generation. This measure had been under consideration for several years, was a subject of bitter contest, and figured as an issue in the presidential campaign. The most persistent opposition came from Arizona, which felt that its rights were not being sufficiently conserved to insure the extension of irrigation projects in the future.

Nevada, New Mexico, and Wyoming already have approved the compact, leaving either Arizona or Utah to complete the requirement. The act marks a great stride in provision for development of the resources of this great river and the States under it, and in the opinion of power engineers is the greatest hydro-electric project ever undertaken by the Government. See DAMS; UNITED STATES.

There was little progress in new reclamation projects and less encouragement for their undertaking. The economic agricultural situation resulted in strong expressions of opposition from many quarters to the Federal Government opening up new areas through reclamation until such

are needed for agricultural production. Commitments already made would provide considerable areas, and the condition due to overproduction made it undesirable for the Federal Government consider plans to bring new areas under cultivation.

The *Engineering News-Record* (New York) in an editorial on May 24 attacked the present situation in American reclamation. It was pointed out that private investment in such works had been virtually killed by Federal operations. That Federal works, supposedly on a subsidy basis by which the Government meets half their cost, are under constant pressure from Congress tending toward the complete cancellation or repudiation of the debt owed the Government by the beneficiaries of these projects. "To the Western Congressman the reclamation debt is a mere formality; the only thing that counts is that reclamation projects shall be built with government money." Repayments by beneficiaries have not been made. Congress passed a blanket readjustment act in 1926 wiping out some \$25,000,000 then owed. Requests for further cancellations or extensions of time had continued. This journal questioned whether the reclamation venture brought about by the Act of 1902 should not be stopped to prevent further use by private interests of politics as a means of financing non-paying business enterprises. In the meantime, several important irrigation works went forward which are described in the article on DAMS.

In England, a Royal Commission on Land and Drainage was appointed to consider and report the need for any amendment of present laws under which difficulties of considerable magnitude have arisen since the Land Drainage Act of 1918. The Royal Commission was designed to closely examine the present drainage laws, based largely on a statute of Henry VIII, with proposals for necessary modifications.

In Holland, the Government was increasing its territory by about 550,000 acres, or 10 per cent, by reclaiming land from the Zuider Zee. A great dike, 300 feet wide at the base and rising 25 feet above the water surface at its crest, was being constructed at a total cost of \$37,000,000, to be increased by the cost of drainage, subsidiary dikes, compensation to fisheries, and other interests injured to a total of about \$200,000,000.

Ambitious plans had been made in Italy by Mussolini for the reclamation of 1,750,000 acres of land at a cost of \$400,000,000 to be spread over 14 years. Half the sum was to be expended on the drainage of swamp lands and the balance on irrigation. Farms were to be laid out on the reclaimed areas, and schools, churches, roads, etc., provided. Foreign financing for this undertaking was declined.

THE HINDENBERG EMBANKMENT. An interesting German work which, although built primarily as a railroad embankment, was showing an important effect on tidal currents and deposits, is the line which connects the mainland of Schleswig-Holstein, Festland, with the sandy bar island of Sylt in the North Sea. The railroad on the new embankment had stopped the tidal currents which formerly operated between the island and the mainland and it was thus probable that it would result in silting up this area and in a considerable reclamation of land. The embankment itself, particularly the means employed to make a final closure against strong tidal currents, is an interesting piece of con-

struction. See *Zeitschrift des Vereiners Deutscher Ingenieure* in the issue of January, 1928.

RECTIFIERS. See DYNAMO-ELECTRIC MACHINERY.

RED CROSS, AMERICAN. An organization chartered by Act of Congress in June, 1900, and incorporated in January, 1905. Its purpose is to supply relief to sufferers from war, from disaster, or from any widespread pestilence or famine. The society is a member of the League of Red Cross Societies, made up of similar societies in 54 nations, and of the International Red Cross Committee of Geneva, Switzerland, composed of Red Cross societies of 58 nations, who are signers of the Treaty of Geneva. All powers of control, management, and administration are vested in a central committee of eighteen persons, six of whom are appointed by the President, six elected by the chapters, and six by the board of incorporators.

On June 30, 1928, there were 3532 chapters of the American Red Cross. Service work for disabled veterans and their families was carried on by 2730 chapters, which spent \$1,838,000, while the national organization spent an additional \$862,337.13 for the same purpose. Service to ex-service men and their families included assistance in filing death and disability claims for Federal and State benefits, such as compensation, bonus, etc., and social or financial aid while adjustment of claims was pending. Hospital service was conducted in 73 government hospitals, including those of the Veterans' Bureau, Army, Navy, and National Soldiers' Homes, and in six contract hospitals.

The year brought many opportunities to the Red Cross for rendering service, as there were 88 disasters of major size, 66 of which were in the United States and its insular possessions. Contributions of funds were made to 22 foreign Red Cross societies for the relief of victims of major disasters. Floods in New England in the autumn of 1927 caused the Red Cross to send a large staff of workers there, who did not complete the rehabilitation work until in the summer of 1928. Relief work in the Mississippi Valley continued, and in the spring of 1928 floods in the tributaries of the Mississippi again made 250,000 persons homeless. Other floods and tornadoes swept through Middle Western States causing great damage and considerable loss of life. A dam break in California claimed many lives and caused much loss of property. Tornadoes numbered 29, floods 14, fires 24, hail-storms 4, mine explosions 3, and earthquakes 4. Monetary relief was given following earthquakes which hit Smyrna, Turkey, Corinth, Greece, and Bulgaria. Relief was also extended following disasters in Mexico, Jerusalem, Switzerland, Austria, Albania, and Brazil.

Among the insular possessions of the United States, relief was extended several times in disasters in the Philippine Islands and once each in Porto Rico and Alaska. The West Indies hurricane, which caused great havoc, occurred after the close of the Red Cross fiscal year, but reports of relief operations at the end of the year showed evidences of prompt activity in this region. In the case of this disaster the Red Cross made a nation-wide appeal for a relief fund. No nation-wide appeal was made in the fiscal year ending June 30, 1928, although an appeal limited to New England States was made as a result of the New England flood.

A total of \$16,544,258.87 was expended by national headquarters for disaster work in the United States during the fiscal year ending June 30, 1928. The society spent \$210,092.50 for assistance to victims of disaster in foreign lands. The Nursing Service of the organization had 47,252 nurses enrolled as a reserve and a source of supply for the Army, Navy, Public Health Service, United States Veterans' Bureau, and for duty in emergencies. In 1928, 39,286 persons received certificates after instruction in home hygiene and care for the sick. At the close of the fiscal year, there were 745 public health nurses supported entirely or in part by the Red Cross. They made 1,099,730 home visits, and inspected 874,218 school children. The Nutrition Service conducted 3982 classes and reached 122,386 school children with nutrition instruction.

The year marked the fourteenth anniversary of the establishment of the Life Saving Service, in which 173,506 men, women, and children were enrolled; 16,108 adults and 22,816 juniors passed the tests during the year. Volunteer workers in chapters made 253,040 garments, 2,276,621 surgical dressings, and completed more than 150,000 pages of Braille. The Red Cross first-aid instruction car was in continuous operation, nation-wide, and with it, 734 meetings and demonstrations were held, with a total attendance of 115,236. Approximately 43,445 certificates were issued to those taking systematic courses of instruction in first aid. Welfare service was provided for families in communities where no other agency existed for such service, an average of 10,049 families being aided each month. On June 30, 1928, there were 6,529,252 children enrolled in the American Junior Red Cross. At the close of the membership year, August 31, the senior enrollment was 4,058,949.

The President of the United States is president of the American Red Cross. Other officers in 1928 were: vice presidents, Robert W. deForest and William H. Taft; chairman of the Central Committee, John Barton Payne; counselor, William D. Mitchell; treasurer, Ogden L. Mills; secretary, Mabel T. Boardman; vice chairman in charge of domestic operations, James L. Fieser; vice chairman in charge of insular and foreign operations, Ernest P. Bicknell. Work is centralized in three administrative divisions, one at the National Headquarters, in Washington, one in St. Louis, and the third in San Francisco.

REED, red, CHARLES ALFRED LEE. American physician and surgeon, former president of the American Medical Association, died at Gloucester, Mass., August 28. He was born at Wolf Head, Ind., July 9, 1856, and was graduated from the Cincinnati College of Medicine and Surgery in 1874, returning to that institution as professor of gynecology and abdominal surgery from 1882-96. He became professor of clinical gynecology at the Medical College of Ohio in 1902. As director of the University of Cincinnati from 1891-03, he was instrumental in the merging of the various medical colleges of the city with the medical department of his university, and in 1909 he became professor of clinical gynecology. He taught until 1917, when he became professor emeritus, also having served as gynecologist at the Cincinnati Hospital since 1898. During the World War he was major in the medical corps of the United States Army.

Dr. Reed was made president of the inter-

national executive committee of the Pan-American Medical Congress in 1893, having acted as secretary-general at the organization's first meeting at Washington, D. C., in that year, and he became president of the seventh congress, in 1915. He was also president of the American Medical Association in 1900 and 1901, and of the American Association of Obstetricians and Gynecologists in 1898. Besides being a fellow of the British Gynecological Society, the American College of Surgeons, and the Cincinnati College of Surgeons, he was a foundation member of the International Periodical Congress of Gynecology and Obstetrics, and a corresponding fellow of the National Academy of Medicine of Peru in 1894. He went to Panama in 1905 as a member of the special United States commission. He was awarded the French Legion of Honor in 1908, for his services in promulgating the influence of French civilization in the United States. Dr. Reed wrote many articles for current periodicals, and published a number of books, including: *Text-Book of Gynecology* (1900); *Diseases of Women* (1913); *Marriage and Genetics* (1913); *Stomach and Intestines* (1913); *Chronic Convulsive Toxemia* (1919); and *The First Estate* (1927).

REED COLLEGE. A non-sectarian, liberal college of arts and sciences for men and women at Portland, Oregon, founded in 1911. The enrollment for the autumn term of 1928 totaled 353, of whom 187 were women, and 166 men, distributed as follows: freshmen, 151; sophomores, 94; juniors, 58; seniors, 39; graduates, 5; special students, 6. The faculty numbered 30 in the autumn of 1928, with 5 graduate assistants. The productive funds amounted to \$1,750,336, and the income to \$96,443. There were approximately 40,000 volumes in the library. President, Norman Frank Coleman, LL.D.

REFINING OF METALS. See METALLURGY.

REFORMED CHURCHES THROUGHOUT THE WORLD HOLDING THE PRESBYTERIAN SYSTEM, ALLIANCE OF. This organization was formed in London, England, in the year 1875 with the one great purpose, to encourage comity, co-operation, and efficiency in the accomplishment of Christian work. There are 106 churches connected with the alliance, located on all the six continents. The members and adherents of the Presbyterian and Reformed churches in the world number about 50,000,000, including those in the Evangelical Church in Germany, which has about 113,000. The Thirteenth Council was scheduled to meet June 20-27, 1929, in the First Presbyterian Church, Boston, Mass., with a representation from Great Britain, the European Continent, Africa, Australia, and America. In 1928 the President was the Rev. Charles Marle d'Aubigne, D.D.; the general secretary was the Rev. W. H. Hamilton; and the American secretary was the Rev. Henry B. Master, D.D., whose offices were at 912 Witherspoon Building, Philadelphia, Pa.

REFORMED EPISCOPAL CHURCH. A denomination formed in December, 1873, by clergymen and laymen who had withdrawn from the Protestant Episcopal Church. It was the outcome of an intense discussion carried on over ritualistic tendencies. As indicated in its name, the denomination held that it supported the principles of the Anglican Church of the time of the Reformation, and of the Protestant Episcopal Church as organized after the American

Revolution. Doctrine and polity, otherwise in general accord with those of the Protestant Episcopal Church, were anti-sacerdotal. A general council of the denomination meets triennially, and sat at Philadelphia, in May, 1927. Since the episcopate is regarded as ancient and desirable but not as existing of Divine right, bishops do not constitute a separate house in the general council. The denomination maintains a theological seminary at Philadelphia, Pa., and from that city issues a periodical, the *Episcopal Recorder*. Statistics for 1928 were: Churches, 86; ministers, 91; church members, 25,300; and Sunday school enrollment, 26,000. Bishop Robert L. Rudolph, of Philadelphia, was presiding bishop of the general council.

REFUSE DISPOSAL. See GARBAGE AND REFUSE DISPOSAL.

REGIONAL PLANNING. See CITY AND REGIONAL PLANNING.

REINACH, rī'nāk, THÉODORE. Jewish scholar and member of the Institute of France, died at Paris, October 29. He was born at Saint-Germain-en-Laye, July 3, 1860, and attended the Lycée Condorcet, École des Hautes Études, and École de Droit. After completing his law course, he was admitted to the Paris bar in 1881, and practiced before the Court of Appeals until 1886. He was chosen secretary of the Conférence des Avocats in 1885, and served as president of the Conférence Molé-Tocqueville three years later. In 1890 he went to Constantinople for archaeological research, and in 1894 he commenced a series of lectures on ancient numismatics at the Faculté des Lettres of the University of Paris. He was elected president of the Société des Études Juives in the same year, and in 1903 was appointed professor of religion at the École des Hautes Études Sociales, later becoming a member of its administrative council. He was president of the Société de Linguistique, 1906, and of the Association pour l'Enseignement des Études Juives, 1907, and vice president of the Ligue pour la défense des droits de l'Hellénisme, 1907. Besides being made director of the *Gazette des Beaux-Arts*, in 1906, and editing the *Revue des Études grecques*, 1888-1907, he translated writings from several languages, and wrote a number of authoritative books on Greek literature, archaeology, and religion. His *Short History of Christianity*, to give the English name of one of his most famous works, is highly regarded in several countries and was translated into several languages. He also wrote: a translation of *Hamlet* (1880); *De la Propriété des Hypothèques légales non inscrites* (1880); *Histoire des Israélites depuis leur dispersion* (1884); *Les Monnaies Juives* (1887); *Trois Royaumes d'Asie-Mineure* (1888); *De Archia Poeta* (1890); *Recueil des inscriptions juridiques grecques* (in collaboration with Dareste and Haussoullier 1890-1904); *République athénienne d'Aristote* (translated 1890); complete works of *Flavius Josephus* (translated 1900); *Les Monnaies Juives; une Nécropole royale à Sidon* (1892-26); *L'Histoire par les monnaies* (1902); *Recueil général des monnaies de l'Asie-Mineure* (in collaboration with Babelon, 1904); *Papyrus Reinach* (1905); *Du Progrès de la Religion* (1905); *La Fête de Pâques* (1906); and *Histoire sommaire de l'affaire Dreyfus* (1924).

REINDEER BREEDING. See ANTHROPOLOGY, under *Old-World Ethnography*.

RELATIVITY, THEORY OF. According to the generalized theory of relativity, light waves originating in a strong gravitational field should have a slightly lower frequency than those originating in a weaker field, and hence the lines in the spectrum of a massive star should be displaced slightly toward the red, relative to their position in terrestrial laboratory spectra. The exhaustive researches of St. John at the Mount Wilson Observatory have shown that such a displacement, of the theoretically predicted amount, is present in the solar spectrum. In 1925, Adams at the Mount Wilson Observatory found the lines in the spectrum of the companion of Sirius to be similarly displaced by the amount to be expected from the known mass and absolute magnitude; and spectrograms secured at the Lick Observatory in 1928 have now independently confirmed the result obtained by Adams.

Trumpler's definitive reduction of the Lick Observatory eclipse observations made in 1922, shows conclusively that the stars in the neighborhood of the sun were displaced from their normal positions by the amounts, and in accordance with the law, required by the theory of relativity. Furthermore, accurate measurements on plates made at the eclipse of January, 1926, by the Sproul Observatory expedition in Sumatra, show no measurable difference in the diameter of the moon from that at other times, thus proving that the cooling of the air in the shadow cone does not produce enough refraction to account for the observed deflections of the stars in that way.

Finally, the famous Michelson-Morley experiment designed to detect the earth's motion through the ether, upon the negative result of which was largely based the fundamental postulate of the restricted theory of relativity, has been repeated at Mount Wilson by Michelson himself, with an apparatus capable of detecting a motion only 2 per cent as great as that to be expected; and no measurable effect was observed. The source of the positive effect previously reported by Miller remains unexplained; in none of the other recent repetitions of the experiment has any such effect been found. See PHYSICS.

REMEY, GEORGE COLLIER. Rear Admiral, United States Navy, retired, died at Washington, D. C., February 10. He was born at Burlington, Iowa, Aug. 10, 1841, and was graduated in 1859 from the United States Naval Academy. He fought in the Civil War in the Union Navy in several engagements, and for a year was a prisoner of the Confederates. After the war he served as an instructor at the Naval Academy, and later was on duty at the Naval Observatory. In the Spanish-American War he commanded the naval base at Key West, Fla. He reached flag rank as a rear admiral in 1898, and in 1900 commanded the United States naval forces in Asiatic waters, at the time of the Boxer outbreak in China. He was retired in 1903, and at the time of his death was one of the oldest American naval officers of his rank. Fifteen retired rear admirals attended

the celebration of his eighty-sixth birthday, at Jamestown, R. I., in 1927.

RENAISSANCE LITERATURE. See PHILOLOGY, MODERN.

RENSSELAER POLYTECHNIC INSTITUTE. A non-sectarian institution for the technical training of men at Troy, N. Y., founded in 1824. In 1928 there were 1426 students enrolled for the autumn term, distributed as follows: Civil engineering, 467; mechanical engineering, 250; electrical engineering, 420; chemical engineering, 159; business administration, 54; biology, 25; physics, 18. The teaching staff numbered 115, an increase of two over 1927. The productive funds amounted to \$4,500,000, and the income for the year to \$563,000. The total value of the property of the Institute, including market value of securities and value of buildings and equipment, was more than \$10,000,000. The gifts for endowment during the year amounted to \$228,500. The library contained 18,355 bound volumes and 19,963 pamphlets. Amos Eaton Hall, a new library and auditorium building, with an auditorium seating capacity of 1400, a reading-room capacity of 300, and stacks for several hundred thousand volumes, was completed and occupied during the year. President, Palmer C. Rickets, E.D., LL.D.

REPTILES. See ZOÖLOGY.

RESEARCH COUNCIL, NATIONAL. A co-operative organization of scientific men of America, interested in pure and applied science, including engineering and industry. It was established in 1916 by the National Academy of Sciences at the request of the President of the United States, for the purpose of coordinating the research facilities of the country for work on war problems involving scientific knowledge. By executive order it was reorganized in 1918 as a permanent body, its essential purpose being to promote scientific research and the application and dissemination of scientific knowledge for the benefit of the national strength and well-being. It maintains a close coöperation with governmental scientific bureaus and their activities, and has the formal recognition and coöperation of 75 major scientific and technical societies throughout the country, its membership being composed in large part of appointed representatives of these societies.

The activities of the council are conducted by a series of major divisions, arranged in two groups. Each division has a chairman and from 20 to 25 members. One group comprises seven divisions of science and technology, representing physics, mathematics, and astronomy; chemistry and chemical technology; biology and agriculture; the medical sciences; psychology and anthropology; geology and geography; and engineering and industrial research. The other group consists of five divisions of general relations: state relations; educational relations; foreign relations; government relations; and research information.

Among the larger undertakings of the Council during 1928 were the maintenance of about 120 research fellowships in physics, chemistry and mathematics, the biological and medical sciences; work on the preparation and publication of International Critical Tables of Nu-

merical Data in Physics, Chemistry, and Technology, of which four of the planned seven volumes had been issued; the establishment, in coöperation with the American Petroleum Institute, of the Central Petroleum Committee which began a series of fundamental investigations in the physics, chemistry, and geology of petroleum, of which investigations about forty were under way; physics of the earth; research surveys of the minor plants; medical problems of animal parasitology, especially ascariasis in children; scientific problems of sex; medicolegal problems; physical causes of deafness in children; problems in tropical agriculture and biology; the atmosphere and man; state archaeological surveys; fellowships in child development; seed germination; structural welding; heat transmission; industrial lighting; highway research; problems of coastal subsidence and elevation; sedimentation; measurement of geological time; and others.

The financial support of the council is derived, first, from a gift of \$5,000,000 from the Carnegie Corporation of New York to the National Academy of Sciences, part of that sum to be devoted to the erection of a suitable building to house the Academy and Council; and second, from other gifts from various sources, mostly made for the specific support of particular undertakings. These sources include the Rockefeller Foundation, General Education Board, International Education Board, Laura Spelman Rockefeller Memorial, Commonwealth Fund, and various individuals and industrial concerns. The council maintains two regular series of publications; *Bulletins*, of which 66 had been issued up to the end of 1928, and the *Reprint and Circular Series*, of which 86 had appeared. It publishes, in addition, miscellaneous publications and its *Annual Report*.

The general administrative officers of the Council for 1928 were: Chairman, George K. Burgess; first vice chairman, Thomas H. Morgan; second vice chairman, John C. Merriam; third vice chairman, Simon Flexner; treasurer, J. S. Ames; permanent secretary, Vernon Kellogg. George E. Hale of the Mount Wilson Observatory, Pasadena, Calif., was honorary chairman. Headquarters of the council are on B. Street, between 21st and 22d Street, Washington, D. C.

RESINS. See CHEMISTRY, INDUSTRIAL.

RÉUNION, rā'u'nyōn'. An island belonging to France, about 420 miles east of Madagascar. Area, 970 square miles; population, according to the census of 1926, 186,637, of whom 180,694 were Europeans, mainly of French origin. The chief towns with their population in 1926 were: St. Pierre, 20,479; St. Denis, 23,390; St. Paul, 21,643; and St. Louis 15,867. The chief port is Pointe-des-Galets. The principal products are rum, sugar, manioc, coffee, tapioca, vanilla, spices, etc. The production of rum in 1926 was 1,124,032 gallons, the greater part of which was exported. The total value of imports in 1927 was 173,640,000 francs; of exports, 146,991,000 francs. The chief exports were sugar and rum, and the chief imports rice and grain. In 1926 837 vessels entered and cleared the ports of the island. There are about 80 miles of railways. The

budget for 1926 showed revenue of 52,502,932 francs and expenditures of 46,076,028 francs. The government of the island is administered by a governor, aided by a privy council and an elected council-general. Réunion is represented in the French Parliament by one Senator and two Deputies.

REVOLUTION, AMERICAN, ANNIVERSARIES. See CELEBRATIONS.

RHETORIC. See PHILOLOGY, MODERN.

RHODE ISLAND. POPULATION. According to a State census made in 1925, the population was 679,260, as compared with 604,397 at the United States Fourteenth Census in 1920, and 595,986 at the census of 1915. The estimated population on July 1, 1928, was 716,000. The capital is Providence.

AGRICULTURE. The following table gives the acreage, production, and value of the principal crops in 1927 and 1928:

Crop	Year	Acreage	Prod. bu.	Value
Hay	1928	45,000	69,000 ^a	\$1,503,000
	1927	46,000	61,000 ^a	1,327,000
Corn	1928	10,000	390,000	526,000
	1927	10,000	380,000	456,000
Potatoes	1928	2,000	244,000	220,000
	1927	2,000	220,000	341,000

^a tons.

MINERAL PRODUCTION. The total value of the State's mineral products for 1926 was \$1,339,398; for 1925, \$1,151,857. In both years the most considerable item was stone. The yield of stone in 1926 was 252,280 short tons, and that in 1925, 153,230 tons; the value of stone produced was: 1926, \$895,718; 1925, \$724,428. There was also some output of lime, graphite, and clay products.

FINANCE. State expenditures in the year ended Nov. 30, 1927, as reported by the U. S. Department of Commerce, were: for maintenance and operation of governmental departments, \$6,476,767 (of which \$471,808 was aid to local education); for conducting public service enterprises, \$20,246; for interest on debt, \$664,040; for permanent improvements, \$3,805,379; total, \$10,966,432 (of which \$3,476,193 was for highways, \$879,375 being for maintenance and \$2,596,818 for construction). Revenues were \$10,574,427. Of this, property and special taxes formed 45.1 per cent; departmental earnings and charges for officials' services, 5.6 per cent; sales of licenses and taxation of gasoline, 38.6 per cent. Property valuation was \$1,299,056,254; State taxation thereon, \$1,558,868. Net State funded debt on Nov. 30, 1927, was \$18,385,137.

TRANSPORTATION. The total number of miles of railroad line under operation on Jan. 1, 1928, was 196.33. No building of additional railroad trackage was reported in 1928.

EDUCATION. The Rhode Island College of Education opened the Henry Barnard School, an institution to provide students of teaching with practice training, observation, and experimental work in pedagogy. The school-age population of the State in 1927 was placed at 201,045 individuals between the ages of 4 and 21 years. There were enrolled in the public schools 112,689 pupils, of whom 98,300 were in the elementary schools and 14,565 in the high schools.

CHARITIES AND CORRECTIONS. The State Public Welfare Commission, a body of nine appointed members serving terms of six years, has authority under Chapter 413 of the General Laws of the State, over the chief of the State health,

reform, and penal institutions. The institutions under its care in 1928 and administered by its appointees were six in number, and were grouped near together on a tract of 1000 acres in the city of Cranston. They were the State Hospital for Mental Diseases, State Infirmary, State Prison and Providence County Jail, State Reformatory for Women, Sockanosset School for Boys, and Oaklawn School for Girls. The combined total number of inmates was about 3500, of which mental patients formed nearly one-half, numbering 1762 on Jan. 1, 1928. Prisoners in State penal institutions at that date numbered 364.

LEGISLATION. The general assembly of the State met in regular annual session January 3. It created two important commissions, the one to investigate the State public welfare commissions, and the other to study the State boards and other agencies with a view to recommending reorganization and consolidation. The so-called Sayles Bill, a measure to amend the law of evidence by admitting books and entries made in the regular course of business, as evidence in civil proceedings, even though the persons having made such entries were not obtainable to testify, was enacted. The Whitten thoroughfare plan, an enactment of the previous session, opposed by the city of Providence as committing the State to too extensive a highway construction programme, was repealed. The forty-eight-hour working week was made the maximum for children under the age of 16 years. There were passed a reciprocal motor vehicle law and an act requiring the use of a dual braking system on motor vehicles. The use of metal containers to safeguard ballots in transport from polling places was made obligatory. A further bond issue of \$500,000 for completing the Washington Bridge was authorized. The custom of the town of Cumberland, maintained for 181 years, of holding its town and State elections at a separate time from other parts of the State, was abolished. Sunday display of motion pictures in Pawtucket, a city that had been excepted from an earlier permissive act, was rendered legal. A resolution of the State Senate requested members of the State delegation in Congress to seek a Federal referendum on Prohibition. A proposal to expend \$300,000 for a State airport was referred to popular vote.

POLITICAL AND OTHER EVENTS. Governor Aram J. Pothier died February 4, while serving his seventh term. Norman S. Case succeeded to the office and was followed as lieutenant-governor by James G. Connolly. Contract for construction of the Washington Bridge was awarded August 13 by the Washington Bridge Commission on a bid of \$2,984,000 and work started shortly afterward. The city of Pawtucket opposed proceedings of the State board of water purification to require it to build a \$1,000,000 sewage disposal plant in order to end pollution of the Seekonk River. In Providence, upon the disclosure in March of alleged efforts of members of the Ku Klux Klan to control enlistment in the First Light Infantry, Rhode Island National Guard, the second battalion of that regiment was relieved of duty and of arms, and inquiry was instituted.

ELECTION. By a very narrow plurality the popular vote at the election of November 6 was in favor of Alfred E. Smith, the Democratic

candidate for President; he received 118,943 votes; Herbert Hoover, Republican, 117,522. The foreign born population in the mill towns strongly favored Smith. Norman S. Case, Republican, was reelected Governor. Felix Hebert, Republican, was elected United States Senator for the regular term, defeating Senator Peter G. Gerry, Democrat, who ran for reelection. Two Republicans and one Democrat were elected to the House of Representatives.

OFFICERS. Governor, Norman S. Case (from February 4); Lieutenant-Governor, James G. Connolly; Secretary of State, Ernest L. Sprague; Treasurer, George C. Clark; Auditor, Philip H. Wilbourn; Attorney-General, Charles P. Sisson.

JUDICIARY. Supreme Court: Chief Justice, William H. Sweetland; Associate Justices; Chester W. Barrows; Charles F. Stearns, Elmer J. Rathbun, John W. Sweeney.

RHODE ISLAND, BATTLE OF. See **CELEBRATIONS.**

RHODESIA, rō-dē'zhī-ă or -zī-ă. The name given to a stretch of British territory in central Africa, extending northward from the Transvaal to the borders of the Belgian Congo and Tanganyika Territory, constituting a British protectorate; bounded on the east by Portuguese East Africa, Nyasaland, and the Tanganyika Territory, and on the west by the Belgian Congo, Portuguese West Africa, and Bechuanaland. It is divided into Northern Rhodesia and Southern Rhodesia by the Zambesi River; Southern Rhodesia comprises Matabeleland and Mashonaland.

NORTHERN RHODESIA. In 1911 this region was formed from the former provinces of Northeast and Northwest Rhodesia. Area, 287,950 square miles; the permanent European population in December, 1925, was 4624 and the native population, 1,140,642. The seat of the Government is at Livingstone, on the Zambesi. The chief crops are corn, cotton, wheat, tobacco, fruits, and rubber, and the minerals include gold, copper, zinc, and lead. The total value of all minerals mined in 1926 was £111,560, to which lead contributed £68,570. Imports in 1926 amounted to £1,725,682; exports, £490,382. The chief exports are live animals, lead, copper, corn, flour, hides and skins, and tobacco. The administration consists of a governor and executive council and a legislative council, partly official and partly elected, the official members having the majority. Governor in 1928, Sir J. C. Maxwell, appointed Aug. 31, 1927.

SOUTHERN RHODESIA. The area of this section of Rhodesia is estimated at 149,000 square miles and the population, according to a census taken in May, 1926, 39,174 Europeans and about 834,473 natives. Capital, Salisbury.

According to the foreign trade statistics for the first nine months of 1927, the imports were £5,502,000 and the exports £5,730,000, both a decided increase over the similar period of 1926. Total railway earnings in 1927 were £4,908,519 and operating expenses, £4,645,490.

Maize is the largest crop, the 1925-26 yield being 1,400,000 bags, the second highest on record. Tobacco, however, was the crop that was attracting most attention, and the 1927 crop of 17,000,000 pounds of Virginia and 180,000 pounds of Turkish tobacco was the heaviest crop on record and nearly three times as large as the 1926 crop. The problem of dis-

posing of the crop was a serious one owing to the reluctance of English manufacturers to use Rhodesian tobacco. Southern Rhodesia is highly mineralized, and is in the fortunate position of having valuable coal reserves strategically placed with respect to a vast surrounding territory.

The total revenue of the colony as brought out in the returns for the year ended Mar. 31, 1927, passed the £2,000,000 mark, and a substantial budget surplus developed in spite of an unforeseen increase in expenditures on roads and bridges and for medical prevention work.

Executive power is vested in a governor aided by an executive council; legislative power in an elected legislative assembly. Governor and Commander-in-Chief in 1928, Lieut.-Col. Sir John R. Chancellor; Prime Minister and Secretary for Native Affairs, Sir C. P. J. Coghlan. Colonel Chancellor was succeeded as governor in the autumn by Sir Cecil Hunter Rodwell, K.C.M.G.

RICE. The yields in 1928 of ten rice-producing countries reporting to the International Institute of Agriculture, Rome, were 6.5 per cent below the production of 1927 and 1.4 per cent above the average production for the five years 1922-26. The acreage for these countries was only slightly under that of the preceding year and 3.8 per cent above that of the five-year period. The estimated yields of some of the principal producing countries outside the United States were as follows: Japan, 528,919,000 bushels; Java and Madura, 246,304,000 bushels; Korea, 120,426,000 bushels; Cochin-China, 112,468,000 bushels; and Italy, 30,976,000 bushels. India in 1927 produced 2,144,236,000 bushels.

Estimates of the U. S. Department of Agriculture placed the crop of the United States in 1928 at 41,881,000 bushels grown on 965,000 acres, or at the rate of 43.4 bushels per acre. This compared with 44,774,000 bushels produced on 1,012,000 acres, or at the rate of 44.2 bushels per acre in 1927. The average farm price on Dec. 1, 1928, was 71.8 cents and on Dec. 1, 1927, 92.9 cents per bushel, making the total value of the crop \$30,077,000 in 1928, and \$41,616,000 in 1927. The yields of the five States included in the data here given for 1928 were as follows: Louisiana, 18,392,000 bushels; California, 8,073,000 bushels; Arkansas, 7,708,000 bushels; Texas, 7,308,000 bushels; and Missouri, 400,000 bushels. The yield per acre in these States ranged from 40 bushels in Missouri to 60.7 bushels in California. The California crop also ranked high in quality. The acreage as compared with 1927 had been reduced in Arkansas, California, and Louisiana.

For the year ended June 30, 1928, the United States exported 230,432,000 pounds of rice grain and 79,376,000 pounds of rice flour, meal, and broken rice, and imported 33,674,000 pounds of cleaned rice grain not including patna rice, 5,996,000 pounds of uncleaned rice, 1,826,000 pounds of patna rice for use in canned goods and 2,606,000 pounds of rice, rice flour, rice meal, and similar products. On the world's markets, the rice of the Southern States, which is long and medium-grained, competes with the rice of India, Siam, and Indo-China which is sold in Europe and South America. The California product, which is a short-grained rice, goes mainly to Japan, and the California export market therefore is dependent to a great extent on rice production of Japan and her colonies. For three years, exports from the Southern States continued to increase and in 1928 heavy gains were made in

the quantities shipped to Canada and Cuba.

RICE INSTITUTE. A coeducational institution for higher education at Houston, Texas, opened in 1912. The enrollment in the autumn of 1928 was 1303, and the faculty numbered 87. The plant equipment and productive funds of the institution were estimated at \$14,000,000 and the income from endowment for the fiscal year 1927-28 was in excess of \$600,000. The library contained approximately 70,000 volumes. President, Edgar Odell Lovett, Ph.D., Sc.D., LL.D.

RICHARDS, HERBERT MAULE. American botanist and educator, died at New York, January 9. He was born at Germantown, Pa., Oct. 6, 1871, and was educated at Harvard University (S.B., 1891; S.D., 1895). He studied at Leipzig in 1895-96 and traveled in China, Japan, the Straits Settlements, and the Malay Archipelago, 1899-1900. He served as an instructor at Radcliffe College 1892-95 and 1897-98, and also at Harvard, 1897-98, and at Barnard College was tutor (1896-97), instructor (1898-1902); adjunct professor (1902-06), and professor of botany from 1906 until his death. He was also scientific director of the New York Botanical Garden. Professor Richards was associate editor of the *Bulletin* of the Torrey Botanical Club, of *The American Naturalist*, and of *Phytological Researches*. He was a fellow of the American Association for the Advancement of Science (vice president of Section G in 1908), and a member of several chemical, botanical, and biological societies. His investigations dealt largely with the structure and development of algae and fungi and with plant reactions. He was a brother of Theodore William Richards, chemist (1868-1928). See RICHARDS, THEODORE WILLIAM.

RICHARDS, THEODORE WILLIAM. American chemist and educator, professor of chemistry at Harvard University since 1901, died at Cambridge, Mass., April 2. He was born at Germantown, Pa., Jan. 31, 1868. He was one of the world's foremost chemists and was considered by many the leading authority on the subject of atomic weights. He was graduated from Harvard College in 1885, with the degree of bachelor of science, received the degree of bachelor of arts from Harvard University in 1886, and continued his studies in chemistry at Göttingen with Nernst and at Leipzig with Ostwald, and at the Technical School of Dresden, Saxony. His entire teaching career was spent at Harvard University, first as assistant professor of chemistry, 1894-1901, and then from 1901 as professor of chemistry. He was exchange professor from Harvard to the University of Berlin in 1907. Professor Richards was also chairman of the chemical department of Harvard, 1903-11, and director of the Wolcott Gibbs Memorial Laboratory after 1912.

Richards redetermined with great precision the atomic weights of many of the chemical elements, measured the compressibilities of a number of elements and compounds, and rendered valuable experimental services in thermometry and especially in calorimetry. Among many high honors which came to him were the Nobel Prize in chemistry in 1914 (in recognition of his work in determining atomic weights); the Davy Medal of the Royal Society; a medal from the British Chemical Society (before which he was Faraday lecturer in 1911); the Willard Gibbs

medal of the American Chemical Society, and the presidency of this body in 1914-15; membership in the National Academy of Sciences, and memberships or honorary memberships in virtually every scientific society of high standing in America and foreign countries. He also received numerous honorary degrees from American universities and from Oxford, Cambridge, Manchester, Prague (the Royal Bohemian University), and Christiania. He received the Franklin Medal of the Franklin Institute in 1916 and the Lavoisier and LeBlanc medals, Paris, in 1922. Besides the presidency of the American Chemical Society (1914-15), he held the presidency of the American Association for the Advancement of Science (1917), and that of the American Academy of Arts and Sciences (1919-21).

In 1916, Professor Richards was a member of the National Research Council and allied committees, in 1918 he served as consulting chemist to the War Department and the Bureau of Mines. In his later years he busied himself with the significance of changing atomic volume, and other effects of internal cohesive and chemical pressure. Thermo-chemistry and electro-chemistry also occupied him increasingly. He wrote many papers on atomic weights and other subjects. Consult J. Koppel, *Experimentelle Untersuchungen über Atomgewichte von Theodore William Richards* (Leipzig, 1909).

RICHARDSON, HARRY ALDEN. American manufacturer and former United States Senator from Delaware, died at Dover, Del., June 16. He was born at Camden, Del., Jan. 1, 1853, and was educated at public schools at Dover, Del., and East Greenwich, R. I. At sixteen he preferred business to college, and entered the canning business of Richardson & Robbins, which had been founded by his father and James W. Robbins. Upon the death of the elder Richardson in 1894, he became the sole owner of the business. He also had large banking and insurance interests. Mr. Richardson was a Republican in politics, but refused to take part in the disputes that divided the party in his State. In 1890 he was an unsuccessful candidate for Governor of Delaware, but in 1907 he was elected United States Senator, serving from that year until 1913. At the time of the great fire at Baltimore, Md., in February, 1907, heavy demands for payment were made on the Delaware Fire Insurance Company, of which Mr. Richardson was president. He directed the full and prompt payment of all claims and placed his entire resources at the disposal of the company.

RICHMOND AND GORDON, SEVENTH DUKE OF (CHARLES HENRY GORDON-LENNOX). British peer, died at Goodwood, England, January 18. He was born at London, Dec. 27, 1845. He was educated at Eton. As Lord Settrington, the "courtesy" title attached to the dukedom, he sat in the House of Commons as Conservative member for West Sussex, 1869-1885, and for South-west Sussex, 1885-88, but his chief interest was in the army, in which he served in the South African War. He was an aide-de-camp to three English sovereigns—Queen Victoria, King Edward, and King George. He succeeded to the dukedom, and to numerous minor titles in 1903, upon the death of his father, well known as a statesman; and in 1904 he received the Grand Cross of the Victorian Order. In the following year he was created a Knight of the Garter.

As owner of nearly 300,000 acres in England and Scotland, the Duke was one of the greatest landowners in the United Kingdom, and he took an active interest in the advancement of agriculture. He was president of the Royal Agricultural Society of England in 1916.

RICKETS. The award of the Nobel Prize (discussed elsewhere under that head) for chemistry in 1928 was said to have been the first time that scientific work done in the direction of human nutrition had been thus honored. The winner was Prof. Adolf Windaus, of Göttingen and the award is the result of experiments which had shown that ultra-violet light can activate the chemical substance known as ergosterol and endow it with the power of preventing rickets. A number of other scientists, however, have contributed to this result. The first experiments actually made with ergosterol were by Prof. George Barger, of Edinburgh. Professor Windaus had also been working in the same field without much success, but the results of Barger led him to renew his efforts and the two men have to some extent worked in collaboration. The roots of the research, however, were much older, dating from the work of Dr. E. V. McCollom and associates, of Johns Hopkins, in the discovery of vitamin D and its anti-rachitic properties and in the other find that ultra-violet rays can independently prevent rickets in animals even in the absence of the vitamin in question. The first scientist to test irradiation of food substances was Prof. H. Steenbock, of the University of Wisconsin, and a patent was secured as a preliminary step in marketing irradiated food substances. One of the leading innovators in this field was Alfred H. Hess, professor of pediatrics in Columbia University, for many years a leading authority on rickets, who attacked the problem from the clinical side. Professor Windaus has taken special pains to acknowledge his indebtedness to Hess, who made his own success possible. Through the irradiation of a great variety of food substances, Hess found that the preventive principle was resident in fatty substances and traced it to the substance known as cholesterol, a near congener of ergosterol which chanced to occur in the former as an impurity. It was in July, 1926, that Professor Barger announced that pure cholesterol is inert, that the preventive substance is ergosterol, which alone is activated by irradiation; hence, the long-known facts that sunlight and codliver oil are naturally preventive of rickets now have a scientific basis. The preventive virtues of the oil are attributable to vitamin D, but there is no longer the supposed need of foods containing this substance when the ultra-violet rays and especially irradiated food substances can produce the same effects. SEE FOOD AND NUTRITION.

RIES, ELIAS ELKAN. American electric engineer and inventor, died at New York, April 20. He was born at Randegg, Germany, Jan. 16, 1862, and was taken to the United States when three years old. He studied at the public schools of New York and Baltimore, Md., received technical instruction at the Maryland Institute, Baltimore, and studied the physical sciences at Johns Hopkins University. He was a telegraph operator for the Gold and Stock and the Western Union companies. In 1880 he removed to New York and became identified with the development of the electric lighting

industry, in the employment of S. Bergmann & Company, the Edison Company, and others, but returned to Baltimore in 1884. He was active in devising methods and instruments for use in electric signaling, railroad controlling, and the development of trolley lines. He is credited with discoveries in connection with the alternating current, and with the invention of an underground basic slotted conduit system which does away with the overhead conductors for trolley cars. He turned his attention to many fields in which electricity was used, and took out more than two hundred and fifty patents on various pioneer inventions. Mr. Ries was a member of the American Institute of Electrical Engineers, the American Electro-chemical Society, the Aeronautical Society of America, an associate member of the Institute of Radio Engineers, and a fellow of the American Association for the Advancement of Science.

RIXEY, PRESLEY MARION. American physician, formerly surgeon general of the United States Navy, and rear admiral, U. S. N., retired, died at his home in Arlington County, Virginia, June 17. He was born at Culpeper, Va., July 14, 1852, and received his medical degree from the University of Virginia in 1873. He entered the naval service as an assistant surgeon in 1874, became past-assistant surgeon in 1877, surgeon in 1888, medical inspector in 1900, and surgeon general, with the rank of rear admiral, in 1902. He was attached to naval hospitals and dispensaries at Philadelphia, Norfolk, and Washington. He was the official physician of President William McKinley from 1898 until the President died at Buffalo, N. Y., in 1901, and was also the official physician to President Roosevelt until the latter retired from the White House; Dr. Rixey continued his ministrations to the former President until the death of Mr. Roosevelt in 1919. He retired from active service in 1910 and lived on his estate in Virginia until 1917. With the entry of the United States into the World War he resumed work with the bureau of medicine and surgery, United States Navy, and acted as inspector general of the medical activities of the Navy until Sept. 18, 1918. He was also a member of the Council of National Defense. He was decorated by the King of Spain for services rendered to the men of the *Santa Maria* following an explosion on that vessel. Dr. Rixey was an ex-president of the Association of Military Surgeons of the United States.

ROADS AND PAVEMENTS. Highway expenditures in the United States, including new construction and maintenance, by 1928 had reached a total estimated at \$1,500,000,000 a year. This includes nothing for city streets, the yearly cost of which runs to a high total. Although progress in highway improvement was marked when considered from the viewpoint of expenditure and of physical accomplishment in a given year, yet it is small compared with the mileage of highways of the country as yet wholly unimproved. Consideration must also be given to the fact that of the highways classed roughly as improved, much of the mileage is only in an elementary or initial stage of improvement, while but a tiny fraction of the entire highway mileage of the country was provided with a wearing surface suitable for the traffic which it carries. Thus, at the beginning of 1928, there were, according to estimates by the U. S. Bureau of Pub-

HIGHWAY MILEAGE BY STATES CLASSIFIED ACCORDING TO SURFACES

[From *Engineering News-Record*, Jan. 23, 1929; based on figures supplied by U. S. Bureau of Roads]

lie Roads, 3,014,000 miles of highway in the United States; but of this, only 589,000 miles, or a little less than 20 per cent, were better than dirt roads. Of the 589,000 miles classed as improved, only 92,000 miles were hard surfaced, while 412,000 were covered with gravel or water-bound macadam and 84,000 of sand-clay surface, the corresponding percentages being 12, 73, and 15.

By hard surface is meant penetration macadam (broken stone with bituminous material sprayed upon it), bituminous concrete, brick and block, and portland-cement concrete. In many of the States, nothing like these percentages would hold good.

An interesting coincidence is that the total road mileage of Texas exceeded slightly the mile-

age included in what is known as the Federal-aid highway system of main interstate and inter-county highways, the figures being 188,564 miles for Texas, against 187,573 miles for the Federal-aid system.

The Federal-aid roads are those toward the construction of which contributions are made by the United States in accordance with a plan adopted in 1921. The figures given in the reports of the U. S. Bureau of Public Roads show that at the close of the fiscal year ending June 30, 1928, there had been "initially improved" by Federal coöperation with the State 72,394 miles of road. Deducting 34 miles of shortening by relocation and 1285 miles "now undergoing State construction," the actually completed mileage June 30, 1928, was 71,074, or about 43 per cent of the Federal-aid highway system. This does not tell the whole story, because within the system named the several States had completed without Federal-aid a large mileage, estimated to bring the total of "initially improved" roads up to about 150,000. Much of this mileage, as already indicated as regards the Federal-aid construction, was of relatively low-grade character. The total mileage of "initial improvement" Federal-aid for the fiscal year ending June 30, 1928, was 8184.

Besides this total of completed "initial construction," there was 2014 miles of "State construction" during the year. The two classes of work cost \$205,044,000, of which the Federal Government paid a little over \$88,000,000, or 43 per cent and the States the balance. These payments were not all made during the fiscal year. The actual disbursement of Federal-aid funds during the year was about \$80,000,000. For the fiscal year beginning July 1, 1929, a total of \$73,000,000 of Federal-aid funds had been allotted by the Secretary of Agriculture, the amounts by States ranging from \$365,000 for Delaware, Hawaii, New Hampshire, Rhode Island, and Vermont to about \$4,231,000 for Texas. Besides the amount expended out of the Federal Treasury for Federal-aid roads, there are appropriated year by year considerable sums toward the construction of roads in the national forests and parks.

In May, 1928, there was signed an act providing for the *Mount Vernon Memorial Highway* to extend from the Arlington Memorial Bridge over the Potomac River in Washington to Mount Vernon. This authorized the appropriation of a total of \$4,500,000 to be expended until the proposed completion of the highway in 1932. Immediately after the act was signed, surveys for the location of the highway were begun by the United States Bureau of Public Roads, which is given charge of the project. For a symposium on "Trends in Highway Development," with contributions from Federal and State highway officials and others, see *Engineering News-Record*, Jan. 3, 1929, in which special stress is laid, editorially and by the special contributors, on lag between highway improvements and highway needs and the problem of future financing. The part of machinery in road construction, for making the highways more attractive, the need for better safeguarding of traffic, better lighting, more tree and shrub planting, are also considered.

ROCHESTER, UNIVERSITY OF. A non-sectarian institution of higher education for men and women at Rochester, N. Y., founded in 1850. It consists of three schools—the college of arts and sciences, composed of a college for men and a college for women; the Eastman School of Music; and the school of medicine and dentistry. A school of nursing is also maintained in conjunction with the Strong Memorial Hospital, the property of the university. The enrollment for the autumn session of 1928, exclusive of extension division and special music students, totaled 1419, distributed as follows: Arts and sciences, 965, of whom 512 were men and 453 were women; bachelor of music course, 346; medicine and dentistry, 108. For the summer session, 861 were enrolled in the arts college, and 492 in the music school. There were 2023 in the extension division. The faculty had 314 members, as follows: college of arts and sciences, 112, of whom 24 were new appointments; school of music, 93; school of medicine and dentistry, 109, of whom 55 were on full time. The productive funds as of June 30, 1928, were \$28,757,382, and the total resources, including land, buildings, equipment, and endowment, were approximately \$44,261,254. The main libraries contained over 145,161 volumes, the Eastern library over 19,000, and the school of medicine library over 28,000. President, Rush Rhees, A.M., D.D., LL.D.

ROCKEFELLER FOUNDATION. An institution chartered in 1913 "to promote the well-being of mankind throughout the world." The scope of its activities in 1928 was in a broad way indicated by the names of the two divisions through which it carries on its work: The International Health Division and the Division of Medical Education.

The Rockefeller Foundation in 1928 gave aid for the advancement of medical education to a large number of institutions, including the following: Department of Hygiene, Dalhousie University, Halifax, Nova Scotia; Faculty of Medicine, University of Montreal, Canada; National School of Medicine and Pharmacy, Port-au-Prince, Haiti; Faculty of Medicine, São Paulo, Brazil; Faculty of Medicine, Cambridge, England; University of London Medical Center; Faculty of Medicine, University of Edinburgh; Department of Hygiene, University of Zagreb, Jugo-Slavia; Shanghai Union Medical College, the School of Medicine, of Shantung Christian University, Tsinan, and St. John's University Medical School, Shanghai, China; Medical Faculty, American University of Beirut, Syria. The Foundation also provided funds for the support of Peking Union Medical College.

Small grants providing for the purchase of apparatus, or literature, for research, or for the supplementing of salaries, were given to departments of medical schools in France, Italy, and Ireland, which offered exceptional facilities for graduate students. Aid was given for improving the teaching facilities of the departments of physics, chemistry, and biology in 12 colleges and universities in China and Chulalongkorn University Bangkok, with a view to promoting the better preparation of prospective medical

students. Medical literature or scientific equipment was supplied to medical institutions in 20 countries in Central Europe in continuation of the programme of emergency aid to such institutions.

Institutions receiving aid for the furtherance of biological science included: The Institute for Biological Research of the Johns Hopkins University; Yale University (for anthropoloid research); Tohoku Imperial University, Sendai, Japan; the Australian Universities, through the Australian National Research Council (for anthropological studies); University of Hawaii and the Bernice P. Bishop Museum, Honolulu. The International Biological Abstracting Service, the National Committee for Mental Hygiene (New York), and the Canadian National Committee for Mental Hygiene received grants from the Foundation; representatives of 30 countries received fellowships in the Medical Sciences; and scientists from several countries were invited to make study visits as guests of the Foundation. The Division of Medical Education published the ninth, tenth, and eleventh series of *Methods and Problems of Medical Education*, during the year.

Schools and institutes of hygiene and public health receiving aid were: The Harvard School of Public Health, Boston; the Institute of Hygiene, São Paulo, Brazil; the London School of Hygiene and Tropical Medicine, England; the State Institute of Public Health, Prague, Czechoslovakia; and the State Hygienic Institute, Budapest, Hungary. Funds were granted to the Medical School of Harvard University to publish a revised edition of a syllabus of preventive medicine and the Imperial College of Tropical Agriculture, St. Augustine, Trinidad, was assisted in maintaining a chair of sanitation and tropical hygiene.

Field stations in eleven of the Southern States, as well as in Ohio, Corsica, Italy, Poland, Spain, and Fiji, were granted assistance for the training of personnel for public health work, and fellowships in public health were granted to men and women from 28 countries. Among the 15 institutions of nursing education receiving aid were: Yale University School of Nursing, New Haven, Conn.; the D. Ogden Mills Training School for Nurses at Trudeau Sanatorium, Saranac Lake, N. Y.; George Peabody College for Teachers, and the School of Nursing of Vanderbilt University; the D. Anna Nery School of Nursing, Rio de Janeiro, Brazil; and the Nurses Training School, Siriraj Hospital, Bangkok. Fellowships in nursing education were also granted to representatives of 11 countries.

The Foundation continued to participate in studies of yellow fever in West Africa, and in campaigns in Brazil for its reduction. Cases of the disease occurred in West Africa during 1928 in Dahomey, Nigeria, the Ivory Coast, Gambia, and Belgian Congo. At the headquarters of the Foundation's Yellow Fever Commission in Accra, West Africa, Bauer and Hudson, experimenting on monkeys, showed that the virus in the mosquito is non-filtrable and is transmissible through inoculation during the period of incubation in the insect, when infection cannot occur through biting. An outbreak of the disease occurred in Rio de Janeiro with 123 reported cases from May to December, practically the first cases of local origin in the city since it was freed of the infection by the campaign of Oswaldo Cruz twenty years previously. Scattered cases of the

disease also occurred in the states of Sergipe, Pernambuco, and Bahia from March to October, and health authorities in these and other states were assisted by the Foundation in maintaining safe *Aedes aegypti* indices.

Malaria campaigns, demonstrations, and surveys were carried on in 18 countries, which received either assistance toward their budgets for this work or the loan of staff members to serve as consultants in formulating and carrying out campaign programmes, including: Jamaica; Porto Rico; Costa Rica; Honduras; Nicaragua; Panama; Salvador; Argentina; the State of Rio de Janeiro, Brazil; Venezuela; Albania; Bulgaria; Italy; Spain; Ceylon; Palestine; the Philippine Islands; and the state of Mysore, India. Fifteen counties in the six States of Georgia, Louisiana, Mississippi, South Carolina, Tennessee, and Virginia, in the United States, received contributions toward their malarial budget. Malaria field studies and research assistance were given in Porto Rico, Bulgaria, Italy, the Netherlands, Spain, the State of Mysore, India, and the Philippine Islands. In the United States, studies were continued by Dr. Hegner of the Johns Hopkins School of Hygiene and Public Health and by Dr. Taliaferro at the University of Chicago, while opportunities for practical training of malaria personnel were provided at the Edenton Station, N. C., and at malaria stations in Corsica, Italy, and Spain.

Anti-hookworm programmes in Mexico, Costa Rica, Guatemala, Honduras, Nicaragua, Panama, Salvador, Jamaica, Porto Rico, Colombia, Paraguay, Venezuela, Spain, Ceylon, India (Madras Presidency and Mysore), the Netherlands East Indies, Siam, the Straits Settlements and in the South Pacific in Fiji, the British Solomon Islands, and Gilbert and Ellice Islands, received financial aid or advisory service. Hookworm studies were continued at Johns Hopkins University, Vanderbilt University and at the Hookworm Research Laboratory in Andalusia, Ala. Local health organizations in 20 foreign countries and in 113 counties in 24 States of the United States received assistance in the way of financial aid, advisory services, or training opportunities for personnel. The areas outside of the United States where such aid was given included: The provinces of Quebec, British Columbia, and Saskatchewan in Canada; the municipalities of Puerto, Mexico, and Minatitlan in the State of Vera Cruz, Mexico, San Ramon district, Costa Rica, the first district of that country to enter the field of local health work; counties in São Paulo, Brazil; and a county in Paraguay; a district each in Austria, Moravia, Czechoslovakia, Hungary, and Siam; two districts in India; departments in France; and the counties of Cork and Kildare in the Irish Free State, the first counties to organize in this state.

In the United States full-time country health departments were aided in 24 States and contributions were made towards the emergency budgets of 78 county health organizations in the six States of the Mississippi flood area. Seven States and nine foreign countries received help in developing their public health laboratory services; nine American States and the Kingdom of Denmark were assisted in expanding their epidemiological services; and in France, Hungary, and Poland, funds were provided toward the maintenance of bureaus for the study and reform of public health activities. In several countries,

contributions were made toward the salaries and traveling expenses of personnel engaged in rural health work, funds were furnished for public health reconnaissances, and the services of staff members were provided as consultants on public health problems. See UNIVERSITIES AND COLLEGES.

ROLLINS COLLEGE. A non-sectarian educational institution of higher learning at Winter Park, Florida, founded in 1885. The enrollment for the autumn term of 1928 totaled 314, of whom 42 were seniors, 58 juniors, 73 sophomores, 94 freshmen, and 47 special and graduate students. The faculty for the autumn term of 1928 numbered 68, an increase of 4 over the previous year. The productive funds of the college amounted to approximately \$600,000; the income from endowment, to approximately \$33,000; and income from other sources to about \$140,000. The library contained 22,000 volumes. Rollins College during the year carried on its pioneering in the two-hour conference plan of education, which substitutes for a one-hour recitation period and a one-hour period outside of class for study, a two-hour class-room period which emphasizes personal contact, and individual development and guidance. The college also has a professor of books. The first chair of this nature to be established in America. President, Hamilton Holt, LL.D., Litt.D.

ROMAN CATHOLIC CHURCH. A leading item in the Chronicle of the year was that Pope Pius XI celebrated the golden jubilee of his priesthood December 20, one of the ceremonies of the day being the inauguration of the new wing of the Vatican Library to hold 250,000 volumes, and which was planned by American experts of the Carnegie Foundation. In his reply to the usual Christmas greetings of the cardinals, on December 24, touching the events of the year, the Pope rejoiced at the peaceful turn of the differences between Bolivia and Paraguay, but grieved sadly over the persecutions of the church in Russia and Mexico. The consistory held on December 17, received no nominations of cardinals, but Cardinal Sbarretti was given the suburban see of Sabina making him a Cardinal Bishop, and Cardinals Bisleti and Sincero were advanced to the order of priests in the Sacred College. The Pope confined his address to praise and thanks to all who had made the Eucharistic Congress at Sydney, Australia, in September, so great a success.

The Pope began the year on January 6 with an encyclical on Christian Unity which asked all non-Catholics to return to the original Church. The second encyclical (May 8) was on the duty of reparation, as governments were conspiring against God and the Church, and the third (September 8) was on the organization of studies relative to the Christian Orient. In his Lenten address (February 26) he scored the immodesty of women's dress. He touched on the same subject again before the Congregation of Rites (August 15) and declared the Church always recognized and encouraged the sane ambitions of modern feminism. A brief for the reform of sacred music was issued (April 27) and a message of friendship and encouragement was sent to the Chinese people (August 1). The relations with the Italian Government did not

materially change during the year. A dispute over the establishment of exclusive control of the physical education of Italian youth by Facist officialism was averted by mutual compromise.

Cardinal Mundelein, of Chicago, was received by the Pope (March 12) and presented a check for \$1,500,000 subscribed in the United States for the building of a new college of propaganda. Other Americans received in audiences were a committee of three women representing the United States Catholic Historical Society of New York who presented a facsimile reproduction of America's oldest book, the *Doctrina Breve* (1544) on June 9; officers and sailors from the United States cruiser, *Detroit*, had a special audience February 3; pilgrims from Chicago, July 27; a group from Pittsburgh August 7, and the Rev. Dr. Edmund A. Walsh, for the Near East Welfare Association, July 17, when the Pope gave credit to American generosity for the progress this work had been making.

THE CARDINALS. No cardinals were created at the December Consistory although the number of Italian cardinals had then been reduced to thirty by the deaths of the year. These were Cardinal John Tacci, Secretary of the Congregation for the Oriental Church, on June 30; Cardinal Gaetano De Lai, Secretary of the Consistorial Congregation, on October 24, and Cardinal Francina Nava, Archbishop of Catania, on December 7. This left the Italian members of the Sacred College in a minority of two, there being thirty-two non-Italians and eight vacancies.

Cardinal Hayes, of New York, was made Grand Protector of the American Chapter of the Knights of Malta (April 4), Cardinal Dubois, of Paris, visited Vienna (November) and was received with special honor. Cardinal Cerretti, Papal Legate to the Eucharistic Congress at Sydney, Australia, made a tour of the United States on his way back to Rome (December).

THE HIERARCHY. The title of the Archdiocese of Oregon City was changed to that of the Archdiocese of Portland, Oregon (November 28), with the see residence at Portland. Bishop Edward Hoban, auxiliary of Chicago, was made Bishop of Rockford, Ill., and Bishop Francis Kelly, auxiliary of Winona, succeeded to that same see (February 13). Bishop Thomas C. O'Reilly was installed as Bishop of Scranton, Pa. (March 8); the Rt. Rev. Thomas J. Walsh, of Trenton, was transferred to Newark, N. J., and the Rev. Dr. John J. McMahon, of Buffalo, N. Y., was named Bishop of Trenton (March 7); the Rev. John M. McNamara was consecrated auxiliary of Baltimore (March 29); the Rt. Rev. Bernard J. Sheil was named auxiliary of Chicago (March 30); the Rt. Rev. Joseph Rummel, of New York, appointed (April 4) Bishop of Omaha, Neb.; the Rt. Rev. Francis Johannes was consecrated coadjutor of Leavenworth (May 1). Because of ill-health, Bishop Thomas F. Hickey, of Rochester, N. Y., resigned and was appointed titular Archbishop of Viminandium.

Archbishop John B. Pitaval, retired, of Santa Fe, died May 23; Bishop Patrick J. Keane, of Sacramento, September 1; Bishop Michael J. Crane, auxiliary of Philadelphia, December 26.

The annual meeting of the hierarchy attended by the four cardinals and seventy prelates was held in Washington, September 14, 15, Cardinals O'Connell and Hayes presiding. The Apostolic Delegate read to the meeting two letters

from the Pope, one commending the Catholic University and the other advocating help for the Society of the Propagation of the Faith and the Catholic Near East Welfare Association. The meeting elected a new Administration Committee and discussed the annual reports of the chairmen of the several departments of the National Catholic Welfare Conference.

STATISTICS. The Catholic population of the United States was given in the *Official Catholic Directory* for 1928 as 19,689,049, a gain in a year of 205,753. Meier's *Catholic Press Directory* for 1928 claims 21,453,928 as the total figure, a gain of 6,188,760 in twenty years. The United States Denominational Census for 1926 gives the total as 18,605,003 "members," a gain of 2,875,188 in the ten-year period.

The *Official Directory* lists 25,773 priests, a gain of 783, serving 18,283 churches, a gain of 642. There are 141 seminaries, with 14,432 students. The hierarchy numbers 4 Cardinals, 17 archbishops, and 99 bishops.

EDUCATION. The parochial schools total 7061, a gain of 66 and the pupils enrolled 2,281,837, an increase of 114,596. At the average public school per capita cost, this represents an outlay saved from the general tax levy for education of \$233,883,292. Catholic high schools for boys number 249 with 52,839 pupils; and for girls, 651 with 60,843 pupils. Of the total 1950 Catholic high schools 1050 were coeducational.

The orphan asylums number 351, an increase of 55, with 51,961 children; the homes for the aged, 147, an increase of 19; and the hospitals, 615.

Estimates made for the Bureau of Education of the National Catholic Welfare Conference give these figures for 1928: Elementary schools, 7747; pupils, 2,263,592; secondary schools, 2298; pupils, 225,295; teachers for both, 73,845; men's colleges, 76; teachers, 4813, pupils 71,178; women's colleges, 84; teachers, 1951; students, 25,633.

The Pope appointed Mgr. James H. Ryan as rector of the Catholic University (q.v.), Washington, in succession to Bishop Thomas J. Shahan, resigned. There were 53 American dioceses represented among the 192 students attending the American College at Rome.

CONGRESSES AND CONVENTIONS. The most notable assemblage of the year was the Twentieth International Eucharistic Congress at Sydney, New South Wales, September 5-9, attended by 200,000 devout worshippers. Cardinal Cerretti presided as the Pope's Legate, and Archbishop Hanna, of San Francisco, Bishops Dunn, of New York, Heelan, of Sioux City, Drumm, of Des Moines, and Schwertner, of Wichita, were among the 120 prelates who, with clergy of various ranks, were present at the opening ceremonies in St. Mary's Cathedral, where also the Methodist Premier of New South Wales welcomed the Cardinal Legate and the visitors to the Congress. After the official opening, the general and sectional meetings of the Congress were held, closing on September 9 with a water procession of the Blessed Sacrament six miles long over which six airplanes manoeuvred in the form of a cross, from Manly to Sydney. After reaching the latter city, a land parade formed and marched through the streets to the cathedral where the final benediction was given by the Cardinal Legate.

The Eucharistic Congress for 1930 was planned

to be held in Carthage, once the city of the glories of the ancient Church of Africa. Mgr. C. J. Quille, of Chicago, and Martin Conboy, of New York, were appointed representatives of the United States on the permanent committee of the International Eucharistic Congress. In 1928 the Catholics of Australasia numbered 1,358,123. There were 2599 churches; 1854 priests; 908 brothers; and 9773 sisters of the Religious orders.

The Supreme Convention of the Knights of Columbus was held at Cleveland, Ohio, August 21-23. The annual report showed the membership as 662,468; 40 new councils being instituted during the year, bringing the total to 2525. The total assets amounted to \$27,976,721. The convention recommended a selective membership drive, a campaign against individuals who circulated a bogus oath of members, and expressed sympathy for the persecuted Catholics of Mexico. See **KNIGHTS OF COLUMBUS**.

Other National Conventions were: The Catholic Press Association, at New York, May 24-26; Catholic Hospital Association, Cincinnati, June 18-22; Conference on Industrial Problems, Cincinnati, June 20-21; Knights of St. John, Buffalo, June 24-28; Catholic Educational Association, Chicago, June 25-28; International Federation Catholic Alumnae, Niagara Falls, August 24-29; Central Verein of America, St. Cloud, Minn., August 24-29; Catholic Charities, St. Louis, September 16-20. At the eighth annual Convention of the National Council of Catholic Men at Cincinnati, November 18-21, Archbishop McNicholas deplored the attacks on the Catholic Church and its members made by bigots during the political campaign and urged Catholic laymen to be calm and patient under the ordeal and to resolve that the Church shall be known as she really is.

MISSIONS. The annual sessions of the Society for the Propagation of the Faith held in Rome, April 18, showed a gain of 12 per cent in the total collections for the year, or a sum of 46,380,000 lire. In this amount the United States led all other nations with the subscription of \$1,126,871. Brooklyn was at the head of all the dioceses with a contribution of \$154,049. The Catholic Church Extension Society, at its annual meeting in Chicago, November 15, reported having received during the year a total of \$1,396,610 for its home mission work.

In July three missionary bishops, were named by the Pope. Father Peter Tcheng, a native Chinese, was appointed Bishop of Swan-hau-fu (there were 87 native Chinese priests). The first native Japanese bishop, Hayasaka was consecrated August 6 as Bishop of Hiroshima. The German Jesuit, Father John Ross was consecrated for the Chinese missionary field. In 1928 there were 215 American missionaries, representing 18 different religious congregations of the United States, laboring in China. During the recent political troubles, 138 buildings belonging to the missions were destroyed. The number of Catholics in China was estimated at 2,427,800, and in Corea at 102,000. In India there were 2,247,000, and in the French and English possessions south of China 1,221,600. The Catholics in all Asia totaled 20,000,000, for whom there were 8155 missionary priests. The Jesuits had 772 members in nine Indian mission fields. Of these, 255 were natives. The American Jesuits have charge of the Patna Station, the smallest of these missions,

BIBLIOGRAPHY. The notable books of the year included: Zumarraga, *Doctrina Breve* (1544, a facsimile reproduction of America's oldest book); James Brodrick, S.J., *The Life and Work of Blessed Robert Francis Cardinal Bellarmine*; Ronald Knox, *What I Believe*; John La Farge, S.J., *The Jesuit in Modern Times*; Fulton J. Sheen, *Religion Without God*; Hilaire Belloc, *How the Reformation Happened*; Jorgensen, *An Autobiography*; Denis Gwynn, *The Struggle for Catholic Emancipation*; Eric M. O'Brien, *The Dawn of Catholicism in Australia*; Timothy O'Herlihy, *Catholic Emancipation*; the Rt. Rev. P. J. Walsh, William J. Walsh, *Archbishop of Dublin*; E. Sainte Marie Perrin, *Pauline Jaricot: Foundress of the Association for the Propagation of the Faith*; Thomas Stapleton, *The Life and Illustrious Martyrdom of Sir Thomas More*; the Rev. Louis C. Fillion, S.S., *The Life of Christ*; Francis A. Litz, *The Poetry of Father Tabb*; Moorhouse F. X. Millar, *Unpopular Essays in the Philosophy of History*; V. F. O'Daniel, O.P., *The Father of the Church in Tennessee*; A. Laveille, *Cardinal Mercier*; Michael Williams, *Catholicism and the Modern Mind*; James A. Hyland, C.S.P., *Rome and the White House*; P. ROME. See ARCHÆOLOGY.

ROTARY CLUBS. Organizations established for the purposes of developing the highest ideal of unselfish service; of making practical application of that ideal to the business and professional life of the individual members, to organizations of which they may be members, and to the communities and nations in which they may live; and of advancing international peace and good will through a fellowship of business and professional men of all nations united in the ideal of service. Membership in the clubs is limited to one representative of each business, profession, or institution in a community. The first Rotary Club was formed in Chicago, in 1905, by Paul Harris, a lawyer; three years later, the second club was formed in San Francisco. In August, 1910, the first 16 clubs held a convention at Chicago to form a national association, and in 1912 an international association was formed to include clubs at Winnipeg, Canada, and London, England.

On Oct. 20, 1928, Rotary International consisted of 2976 clubs with an approximate membership of 138,500 in 44 countries. There were 2259 clubs in the United States, 92 in Canada, 296 in Great Britain and Ireland, and 329 in other parts of the world. The official publication of the organization is *The Rotarian*, a monthly published at Chicago. *The Rotary Wheel* is the official publication for Great Britain and Ireland. Officers for 1928-29 were: President, I. B. Sutton, Tampico, Mexico; vice presidents: Thomas Stephenson, Edinburgh, Scotland; Almon E. Roth, Palo Alto, Calif.; and Eduardo Moore, Santiago, Chile; directors: William C. Achard, Zurich, Switzerland; Wm. H. Campbell, Rochester, N. Y.; John E. Carlson, Kansas City, Kans.; Joseph A. Caulder, Regina, Sask., Canada; R. L. Hill, Columbia, Mo.; S. Wade Marr, Raleigh, N. C.; Arthur H. Sopp, Huntington, Ind.; and Joseph Schulz, Prague, Czechoslovakia; secretary, Chesley R. Perry, Chicago, Ill.; and treasurer, Rufus F. Chapin, Chicago, Ill. Headquarters of Rotary

International are at 211 West Wacker Drive, Chicago, Ill., with a branch office at 2 Pelikanstrasse, Zurich, Switzerland.

ROUMANIA. See RUMANIA.

ROWING. There was unparalleled activity in rowing circles throughout the world in 1928, the competitions in connection with the Olympic Games (q.v.) being the inspiration. The University of California eight-oared crew attained the highest rating through its Olympic triumph gained after its sensational successes in the various college fixtures in the United States. The Californians started on their way to fame by defeating the University of Washington on the Pacific coast. Their next victory came in the intercollegiate regatta on the Hudson where they dethroned Columbia which had won the championship in 1927. Yale returned to its winning ways against Harvard in their annual contest at New London, Conn., and also captured the triangular regatta with Columbia and Pennsylvania. In the final of the Olympic trials at Philadelphia, however, Yale was forced to bow before the amazing California crew. Columbia deserves third place among American college crews with its victory in the Childs Cup contest and its fine showing against California in the intercollegiate regatta, where the Blue and White was placed second. For the fifth year in succession, Cambridge defeated Oxford in their annual struggle on the Thames.

The fifty-sixth national championship regatta of the National Association of Amateur Oarsmen of America was held at Philadelphia, the winners in the more important events being: single sculls, B. C. Turner; senior 4-oared shells, Bachelors' Barge Club; senior double sculls, Bachelors' Barge Club; junior 8-oared shells, Penn. B. C.; intermediate 8-oared shells, Detroit Boat Club; junior single sculls, J. Denney.

J. A. Barry of England won the world's professional sculling championship and Joseph Wright, Jr., of Toronto captured the diamond sculls. See OLYMPIC GAMES.

RUBBER. The most important event in the rubber industry in 1928 was the removal of the Stevenson Restriction Plan on November 1, after it had been in force for some six years. This plan had been adopted by the British Government in 1922 with the manifest object of maintaining the price of rubber by restricting production and exports from British Malaya. It had proved unsuccessful and producers other than those of the British Empire, notably the Dutch, had benefited more through the artificial prices than the British planters whom it was intended to aid. Previous YEAR BOOKS have discussed the origin and effect of the Stevenson Plan and its effect on the rubber industry. When it was announced on April 4 that it was to be abandoned, there was a drop of six cents a pound in the price of crude rubber in a single day, and after a recession the price was confined to within narrow limits. British exports of crude rubber in 1928 were at an average price 25 per cent less than in 1927 and prices at the end of the year were approximately one-half those prevailing at the beginning. On Jan. 1, 1928, crude rubber sold in New York slightly above 41 cents a pound; while at the end of the year the price was about 18 cents.

With the removal of the restriction, the production of crude rubber was greater than at any previous time in the history of the industry,

with an even greater production anticipated for 1929. Likewise, the consumption of rubber throughout the world was in excess of all previous records and for the United States alone was estimated at about 445,000 tons, which was some 75,000 tons more than was used in 1927, as will appear from the accompanying summary. With the remainder of the world taking about 215,000 tons, the total world's consumption would be more than 662,000 tons.

The world production of rubber in 1928 was estimated at 653,933 long tons, as compared with 606,687 tons in 1927. The sources of this supply with the shipment in gross tons were as follows: British Malaya, 259,643; Ceylon, 57,546; India and Burma, 10,790; Sarawak, 10,087; B. N. Borneo, 6505; Siam, 4813; Java and Madura, 58,848; Sumatra, East Coast, 82,511; other Netherland East Indies, 121,770; French Indo-China, 9601; Amazon Valley, 21,129; Mexican Guayule, 3076; other America, 1490; Africa, 6124. Later figures of the U. S. Bureau of Foreign and Domestic Commerce gave 658,000 tons as final statistics, distributed as follows: Middle East, 626,181 tons; Amazon Valley, 21,129 tons; other sources, 10,690 tons. The requirements for 1928 were estimated at 638,000 tons and for 1929 at 737,000 tons. At the end of 1928, the stock in the United States was estimated at 66,166 tons, as compared with 101,685 tons at the end of 1927, there being a consumption during the year of 434,181 tons, as against 372,528 tons in 1927. At the end of 1928, the United Kingdom had a stock of rubber totaling 22,691 tons, compared with 65,663 tons on hand at the end of 1927, with a year's consumption of 47,818 tons, as compared with 44,659 tons in 1927.

The crude rubber and milk of rubber imported into the United States in 1928, according to the U. S. Department of Commerce, amounted to 978,-

107,393 pounds valued at \$244,854,973, as compared with 954,750,355 pounds valued at \$339,-559,142 imported in 1927. The most important source was British Malaya, which sent 558,772,-657 pounds valued at \$138,011,676, as compared with 568,643,977 pounds valued at \$203,827,998 sent in 1927. Other countries which sent large quantities of rubber to the United States were Netherland East Indies, 190,438,542 pounds valued at \$49,054,659, as against 169,551,202 pounds valued at \$62,817,471 in 1927, and the United Kingdom which sent in 1928, 108,305,-042 pounds valued at \$28,929,958, compared with 73,787,953 pounds valued at \$26,742,554.

In the compilation of the statistics of imports of crude rubber into the United States made by the Rubber Association of America, it was estimated that the grand total was 446,421 long tons distributed as follows: Plantation, 429,-191; Paras, 12,050; African, 1258; Centrals, 557; Guayle, 3364; Manicola and Matogrosso, 1. The greater part of the plantation rubber was received at the Port of New York, the total for the year amounting to 373,345 tons. Arrivals at other ports were as follows: Baltimore, 12,317 tons; Boston, 15,969; Los Angeles, 15,-809; Philadelphia, 10,171; Portland, 54; San Francisco, 694; Vancouver, 832.

The statistical department of the Rubber Association of America in its summary for 1928 reported a grand total consumption of rubber amounting to 406,849 long tons as against 342,-726 long tons in 1927, the figures representing information furnished by approximately 92 per cent of the manufacturers and consumers of the United States. These statistics with the corresponding items for 1927 and 1926, indicating the consumption of rubber as regards products, could be divided as in the accompanying tabulation. The Rubber Association also reported the

^a Figures represented information furnished by 92 per cent of consumers and manufacturers of the United States.

grand total sales of the various products on the same basis, indicating a total value of production for 1928 of \$1,099,790,000, as compared with \$1,113,380,000 in 1927 and \$1,206,022,000 in 1926.

In the production of solid and cushion automobile tires, the total for the year was 58,457,863 pneumatic tires, 439,519 solid tires, and 67,704 cushion tires, the total pneumatic tires for 1928 comparing with 48,331,311 in 1927, and the total of solid and cushion tires comparing with 58,030 in 1927. The total production of inner tubes during 1928 was 60,134,881, as compared with 53,117,064 in 1927. The shipments from the various tire manufacturers followed very closely the production, being 55,721,937 pneumatic tires in 1928, as against 48,052,414 in 1927. There were shipped, in 1928, 57,845,189 inner tubes, as compared with 54,671,929 in 1927. Shipments of solid tires in 1928 were 437,748 as against 477,154 in 1927, and of cushion tires, 74,854 in 1928, as against 80,853 in 1927. The manufacturers of tires consumed 600,423,401 pounds of crude rubber and 222,243,398 pounds of cotton fabric in 1928, as compared with 514,994,728 pounds and 177,979,818 pounds 1927. These figures, compiled by the Rubber Association of America, were estimated to represent 75 per cent of the industry.

The Rubber Association of America announced the total production of reclaimed rubber in 1928 as 207,869 long tons, compared with 172,723 long tons in 1927. Of the 1928 production, 84,073 tons came from concerns who were reclaimers solely, and 123,796 tons from manufacturers who also reclaimed. The shipments of reclaimed rubber in 1928 totaled 129,070 long tons as against 104,932 long tons in 1927; while the consumption was stated at 156,432 tons in 1928, as against 138,423 tons in 1927. The consumption of scrap rubber in 1928 was estimated at 262,231 long tons, as against 223,188 long tons in the previous year. Those engaged solely in reclaiming taking 151,462 tons in 1928; while manufacturers who also reclaimed took 100,859 tons in the same year. This consumption was given as representing 73 per cent of the entire industry.

RULE, WILLIAM. American editor, died at Knoxville, Tenn., July 26. He was born near Knoxville, May 10, 1839, and after receiving a common-school education entered newspaper work when twenty-one years of age on *Brownlow's Whig*. His career was interrupted by service in the Union Army in the Civil War, in 1862-65, in which he reached the rank of captain. He was editor of the *Knoxville Chronicle*, 1870-72, and from 1885 until his death, he edited the *Knoxville Daily Journal and Tribune*, which he founded. He was believed to be the oldest newspaper editor in active service in America. Although a Republican in a State and city with many Democratic sympathizers, Captain Rule was highly regarded and was elected mayor of Knoxville in 1878 and in 1898. He served as postmaster of Knoxville and also as clerk of the Knox County Court. He was a member of the Republican National Committee, 1876-84, and a trustee of the University of Tennessee (secretary of the board for forty years and the recipient of the honorary

degree of A.M. on his retirement). In 1873 Captain Rule won national notice by his refusal to fight a duel and his denunciation of dueling as "heathenish." His action was largely instrumental in bringing about the passage of a Tennessee law against dueling. One of Captain Rule's office boys was Adolph S. Ochs, later owner and publisher of the *New York Times*.

RUMANIA. The largest and northernmost of the Balkan States; bounded on the south by the Danube River and Bulgaria; on the east by Russia and the Black Sea; on the north by Hungary, and on the west by Jugo-Slavia; a constitutional monarchy. It is made up of the following divisions: The two old principalities or Wallachia and Moldavia (united in 1861); the Dobrudja; Bessarabia, ceded in March, 1918; Bukowina, in November, 1918; and Transylvania, in December, 1918. Area before the War, including territory taken from Bulgaria by the Treaty of Bucharest, Aug. 7, 1913, 53,849 square miles; population, estimated in 1915, 7,904,104. Area after the War, 122,282 square miles; population, 17,393,149. Chief towns with their populations at the latest available dates; Bucharest, capital, 308,987 (1917); Chisinau, 114,110 (1914); Cernauti, 87,128 (1914); Ismail, 85,600 (1914); and Jassy, 76,121 (1914). The movement of population in 1925 was: Births, 605,053; deaths, 363,054; marriages, 153,480.

PRODUCTION, ETC. The area under each crop and the production for 1927 were as follows: Wheat, 7,752,882 acres, 2,634,465 metric tons; rye, 703,137 acres, 242,644 tons; barley, 4,410,650 acres, 1,249,916 tons; oats, 2,711,020 acres, 851,851 tons; maize, 10,548,557 acres, 3,695,208 tons. A considerable acreage is devoted to vineyards, and tobacco is grown to some extent. The only industries of importance are flour milling, brewing, and distilling. The chief minerals are salt, iron, lignite, copper, and petroleum. Production of crude petroleum in 1926 reached 3,241,805 tons despite a general depression in the industry. This compares with 2,313,345 tons produced in 1925. See JEWS.

COMMERCE. During 1927 the foreign trade of Rumania continued its favorable trend, closing with a large excess of exports. Though the value decreased in terms of the leu, in view of its marked appreciation, the dollar value of imports increased by 17 per cent and of exports by about 30 per cent. High import duties under the new tariff, effective in April, 1927, tended to restrict imports. Exports of cereals in 1927 were the heaviest of any post-war year. Exports of petroleum products also reached a record. There was a 42 per cent increase in the number of hogs shipped and a decrease of about 40 per cent in exports of eggs. Exports were greatly stimulated by reduction or elimination of export taxes on the principal commodities. Imports in 1928 were valued at 32,145,101,000 lei and exports at \$26,919,257,000 lei. The figures for 1927 were: Imports, \$33,428,547,000 lei; exports, \$37,703,178,000 lei.

COMMUNICATIONS. All the main railway lines in Rumania are owned and operated by the state. There are several privately owned lines, mainly in Transylvania, for which information was not available. The length of Rumanian State Railways at the close of 1927 totaled 14,081 kilometers, of which 6427 were main line, 3934 kilometers, branches, and 3720 kilometers, sidings. In addition, the State Railways owned and oper-

ated 721 kilometers of narrow-gauge track. Operating revenues, according to preliminary figures, amounted to 12,334,499,000 lei, and other revenues to 457,309,000 lei; operating and other expenses were estimated at 14,800,000,000 lei, thus creating a tentative deficit of 2,008,192,000 lei. (The average rate of exchange of the lei in 1927 was \$0.006.) The rolling stock in operation at the close of the year comprised 2139 locomotives, 41,560 freight cars, 2032 passenger cars, and 8871 tank cars. The equipment of the State Railways was in extremely bad condition, largely because of inadequate shop facilities and incompetent mechanics. During 1927 the State Railways completed a new boiler shop at Bucharest, heightened the old shops to permit the construction of raised turntables, finished 22 shops at various points throughout the country for minor repairs to rolling stock, and began the construction of a new line from Belgrade, in Bessarabia, to Ismail, a port on the Danube. Plans called for the retracking of 300 kilometers of line annually for a period of six years, and a contract amounting to 4,000,000,000 lei was placed with the Reshitza Co., Rumania's leading iron and steel concern, for rails and other necessary materials.

GOVERNMENT. Under the constitution of Mar. 28, 1923, which nationalized all forests and subsoil, executive power is vested in the King and a council of ministers, the King having a suspensive veto over the laws passed by parliament; and legislative power is vested in a senate of 170 members and a chamber of 347 members. The senate is composed of life members and various officials; the deputies in the lower house are elected by all taxpaying citizens 21 years of age. King in 1928, Michael I. born Oct. 25, 1921; proclaimed King on July 21, 1927, after the death of his grandfather, Ferdinand I. (See *YEAR BOOK* for 1927.) The cabinet at the beginning of the year was as follows: Prime Minister and Finance, Vintila Bratianu; Foreign Affairs, N. Titulescu; Interior, I. G. Duca; Agriculture, C. Argetoianu; Public Instruction, Dr. C. Angelescu; Public Worship, A. Lapedatu; Justice, I. Nistor; Public Health and Social Welfare, I. Inuletz; Labor, Dr. N. Lupu; Communications, C. D. Dimitriu; War, General Angelescu; Industry and Commerce, L. Mrazec.

HISTORY. The outstanding event in Rumania during the course of the year was the so-called "bloodless revolution" which swept the Bratianu government out of existence and brought into office the National Peasants' party under the leadership of M. Maniu. Throughout the early part of the year, both the Government and opposition parties were preparing for the election which both sides felt was bound to come. As noted in previous *YEAR BOOKS*, the Bratianu brothers, who represented the commercial and business groups of the country, had succeeded in holding a strangling grip over the affairs of the country ever since the close of the World War. The National Peasants' party had been continually growing in strength, but had never been able to grasp control of the Government because of the severe regulations of the Bratianu group, which virtually assured success before the election was actually held. In 1928, however, the Peasants' party felt sure that their time had come and chafed at the bit when the inevitable elections were postponed from time to time by the party in power. All kinds of dem-

onstrations were held by the Peasants to make their demands effective. In March, an army of 60,000 marched on the capital and brought provisions and supplies with them because they declared they were going to stay in Bucharest until the Bratianu government resigned. Normally, such a move would result in civil war or riots, but nothing of the kind occurred. The Regency announced that it would not request the resignation of Bratianu, and the Government itself stated that it would not resign under any circumstances. The only tangible result was the withdrawal of the Peasants' representatives from Parliament and the gradual drifting back home of the small army of farmers.

Another huge gathering of farmers in Alba Julia, Transylvania, early in May, estimated at 200,000, failed to move the Regency or cabinet into action consonant with the demands of the peasants. It was felt in many quarters that these mass meetings on the part of Dr. Maniu scarcely helped his cause to any great extent, because when they accomplished nothing they left the Bratianu government just that much stronger. Unwittingly, Prince Carol played into the hands of the Government party. He was requested to leave Great Britain on May 8 on the grounds that he was conspiring against a friendly state. It was thought that this meant he was attempting to get enough support in Great Britain to make his triumphant return to Rumania a success. The Bratianu followers took this occasion to represent themselves as the only group in the country strong enough to prevent the return of Prince Carol.

The situation remained very acute all during the summer and in the early autumn, with Dr. Maniu and his party refraining from participation in the government and establishing a rump parliament which denounced the Government. Early in November, the Regency, evidently convinced that the National Peasants' party was not to be denied, demanded the resignation of the Bratianu government. The Prime Minister claimed that he was in the midst of important policies and could not retire just yet. This excuse was of no avail, however, and he gave up the reins of government on November 4.

After considerable political manœuvring on the part of the Regency, which was not very keen for the appointment of Dr. Maniu, it was compelled to turn to the Transylvanian leader, who formed a government on November 9. One of his first acts of office was the dissolution of the old Parliament and the calling of new elections immediately. The elections were held on December 12 and the Peasants' party was overwhelmingly successful, carrying more than 350 seats out of a total of 376 in the Lower House. Many observers felt that this was the first fair and free election which Rumania had held in years. It was expected that the results of the election and the accession of Dr. Maniu and his party to power would have a very strong tendency to decentralize and democratize the country.

RUSHDI PASHA, HUSSEIN. Egyptian statesman, died March 13. Rushdi Pasha was Prime

Minister of Egypt, from April 1914, to Mar. 1, 1919, the entire period of the World War, and his services to the cause of the Allies won high praise from the British, with whom he was closely associated. When Turkey, as an ally of Germany, entered the War, and Egypt was involved as a nominal dependency of Turkey, the position of the Government headed by Rushdi Pasha became highly embarrassing, but he was staunch in his loyalty to the Allies. His position became still more difficult when, after the Armistice, the question arose of the freedom and self-determination of the nations, great and small. Great Britain professed herself unable to grant the demand for the complete independence of Egypt, and Rushdi Pasha tendered the resignation of himself and his cabinet on Mar. 1, 1919. He consented on April 8 to resume office. Ten days later, however, he found his position hopeless and resigned again. He served as vice president of the council under Adly Pasha, when that Egyptian statesman undertook to negotiate a settlement of the Egyptian question in London, but his health failed. He won the high personal regard of both the Egyptians and the British.

RUSSELL SAGE FOUNDATION. An institution established by Mrs. Russell Sage in memory of her husband. The endowment was \$10,000,000, to which \$5,000,000 was added by will. It was incorporated by an act of the Legislature of New York in April, 1907, for the "improvement of social and living conditions in the United States of America." The Foundation does not relieve individual need, but studies and interprets facts with regard to social conditions and methods of social work, makes the information available by publications, conferences, and other means of public education, and seeks in these and other ways to stimulate action for social betterment. The Trustees of the Foundation are Robert W. de Forest, president; Lawson Purdy, vice president and treasurer; John M. Glenn, secretary and general director; directors, Frederic A. Delano, John H. Finley, Mrs. Frederic S. Lee, Dwight W. Morrow, Mrs. Finley J. Shepard, and Harold T. White. Shelby M. Harrison is vice general director.

The work of the Foundation is carried on through departments whose titles and directors are as follows: Charity Organization, Mary E. Richmond (died, Sept. 12, 1928); Industrial Studies, Mary Van Kleeck; Recreation, Lee F. Hanmer; Remedial Loans, Leon Henderson; Statistics, Ralph G. Hurlin; Surveys and Exhibits, Shelby M. Harrison; and Library and Publication. A consultation service on problems of Delinquency and Penology is under the direction of Hastings H. Hart.

The aim of the Charity Organization Department is to study and publish in the field of social case work and family welfare. In recent years its attention has been directed chiefly toward the laws governing marriage and their administration. The study of the subject was completed during 1928, for publication early in 1929 in two volumes, *Marriage and the State*, by Mary E. Richmond and Fred S. Hall, and *Marriage Laws and Decisions—A Digest*, by Geoffrey May. *Marriage and the State* gives the results of an inquiry begun in 1920 into the way in which marriage laws operate in practice. The conclusions reached were based on field studies carried on in 96 cities in 36 different States.

As consultant in delinquency and penology,

Dr. Hart responds to requests for advice and service in this field, especially with reference to legislation, administration, and questions regarding buildings and equipment. During 1928, as a first step toward the correction of the unfavorable conditions surrounding Federal prisoners in county jails, a resolution was drafted by Dr. Hart providing for an investigation of the care and treatment of Federal prisoners by a committee of the House of Representatives. This was presented in December, 1927, and its passage in an amended form, which included the question of prison labor, was obtained early in 1928. Dr. Hart was consulted during the year with reference to plans for public prisons, reformatories, and jails in New York, New Jersey, Massachusetts, Michigan, Ohio, Tennessee, and Louisiana, the estimated cost of these projects being over \$31,000,000.

The Department of Industrial Studies investigates industry in the United States in its effect upon the men and women at work in it and upon their families. The primary interests of the department during 1928 were (1) unemployment, the statistics of employment, and methods of collecting wage statistics; (2) the functioning of works councils and organized groups of wage earners in relation to the management of industry; and (3) methods of research in human relations in industry. Special attention was also given to conditions in this field in foreign countries through connections established with the International Labor Office of the League of Nations, and other international agencies. During the year a report on "Personnel Management in a Retail Store" (William Filene Sons and Company) was completed and was to be published. The director of the department served as Chairman of the technical advisory committee created to assist in the study of the "Effect of Labor Laws upon Women's Opportunities in Industry," which was made by the Women's Bureau of the United States Department of Labor, and was completed by the end of the year, and as Chairman of the Committee on Governmental Labor Statistics of the American Statistical Association.

The Department of Recreation aims to assist in bringing about adequate provision for all forms of wholesome recreation by studying the best methods of promotion, organization, and administration of recreation facilities and encouraging their adoption. During 1928, Mr. Hanmer completed a survey of recreation facilities and needs within the New York region, published as volume v of the report of the Committee on the Regional Plan of New York and Its Environs. A report entitled "The Neighborhood Unit" was also completed by Clarence Arthur Perry, Associate Director, and was scheduled to appear during 1929 in volume viii.

The aim of the Department of Remedial Loans is to conduct a campaign of education for the protection of small borrowers from extortion, to urge the passage and enforcement of adequate laws for the regulation of the small-loan business, and to encourage the formation of credit unions. The Uniform Small-Loan Law, prepared by the Foundation and in force in twenty-four States, was adopted in 1928 by Louisiana, despite plentifully financed opposition of loan sharks, but failed of adoption in Kentucky. The Louisiana law was later declared unconstitutional by a lower court, but at a special session of the Legislature, it was reenacted without the exemptions which

had been held to be unconstitutional. The chief violation of the uniform law in recent years has been "salary purchasing." The "salary buyer" attempts to escape the restrictions of the law by pretending that his transaction is not a loan but a purchase of wages earned but not yet received. To strengthen the Uniform Law against this threatened evasion, a new section was added during the year in New York and Virginia. In Maryland, where the same section had been previously adopted, its constitutionality was established by a court of last resort for the first time in any State. In addition to extending the Uniform Law and assisting in its administration, the department continued to encourage credit unions as a practical and constructive means of meeting the need for small loans.

The Department of Statistics makes statistical investigations relating to social conditions. It advises members of the staff of the Foundation and others engaged in social work concerning sources of statistical information, the planning and conduct of statistical inquiries, and the presentation of statistics. It reviews all statistical material intended for publication by the Foundation. During 1928 the department continued and developed its collection of comparative monthly statistics in family case work, hospital social work, mothers'-aid and child-welfare work.

The department's studies, so far as published during 1928, appear in two papers: "Trends in Loads and Costs in Child Welfare in New York State," in the *Proceedings in the New York State Conference on Social Work*, 1927; and "Some Results of the Two Years' Study of Family Case Work Statistics," in the *Proceedings of the National Conference of Social Work*, 1928.

The purpose of the Department of Surveys and exhibits is to study and develop methods of presenting information about social conditions and social work to the public. The three major studies upon which the department's staff was at work during the twelve months were: a study of "Publicity for Social Work," by Evart G. Routzahn and Mary Swain Routzahn; a study of immigrant contributions to the arts and crafts, by Allen Eaton; and a bibliography of social surveys. The two latter studies were still in progress at the end of the year. The first study named was published early in 1928. Mr. and Mrs. Routzahn were actively connected with the Committee on Publicity Methods in Social Work and with the Public Health Education Section of the American Public Health Association, editing the *News Bulletin* of the former and the Education and Publicity Section of the *Journal* published by the latter.

The library of the Foundation which is open to all who are interested in social welfare, contained 27,906 bound volumes and 96,061 pamphlets and unbound reports. About 250 periodicals are regularly received. Six numbers of the bi-monthly bibliographical bulletin were issued on the following subjects: Credit unions, community organization, industrial and labor problems, books on social subjects published in 1928, social case work (revised), and cost and standards of living. The library also, in response to requests, prepared 178 typewritten bibliographies on other subjects.

During 1928 the Foundation continued its financial support of the Committee on Regional Plan of New York and Its Environs, of which Thomas Adams is director. That committee's re-

ports, when completed, will include ten survey volumes presenting the facts and information upon which the Plan is based, and two additional volumes, to be published in 1929, containing the proposals of the committee in the form of a comprehensive plan for the development of the region. Six of the ten survey volumes were published during 1928.

RUSSIA. A republic comprising the greater part of the former Russian Empire; officially entitled the Union of Soviet Socialist Republics. Capital, Moscow.

AREA AND POPULATION. According to the Soviet Union Information Bureau, which supplied much of the material used in this article, the area of the Union of Soviet Socialist Republics is 8,144,228 square miles. The population as of Jan. 1, 1928, was estimated by the Central Statistical Board at 149,900,000. The population, according to the census of 1926-27 was 147,013,600, including 71,024,300 males and 75,989,300 females. In 1914 the population of the same territory was 138,200,000. The population is 82 per cent rural, 18 per cent urban. It is composed of 182 different nationalities, speaking 149 different languages and dialects. The death rate of the country was 20.9 per thousand in 1926 as compared with 28.3 in 1913. In Moscow the figures were, respectively, 13.4 and 23.1. On Jan. 1, 1928, the figure for unemployment was 1,352,000.

The Union of Soviet Socialist Republics is composed of six constituent republics with their respective populations as follows: Russian Socialist Federated Soviet Republic, 100,858,000; White Russian Soviet Socialist Republic, 4,983,900; Transcaucasian Federation, 5,850,700; Turkoman Soviet Socialist Republic, 1,030,500; Ukrainian Soviet Socialist Republic, 20,020,300; Uzbek Soviet Socialist Republic, 5,270,200. The Russian Socialist Federated Soviet Republic contains 76 per cent of the population and 94 per cent of the area of the Union. It contains eleven autonomous republics, twelve autonomous areas, with further subdivisions into provinces, counties, districts, and townships. The other constituent republics embrace similar subdivisions of autonomous republics and areas, along racial or national lines.

The census showed a strong trend of population to the cities, in line with the industrialization of the past few years. Since the urban census of 1923, Moscow and Leningrad had each increased its population by over 500,000. Other large cities had gained an average of 30 per cent in population in the three years. Population of the principal cities, census of 1926-27: Moscow, 2,025,947; Leningrad, 1,614,008; Kiev, 513,789; Baku, 452,808; Odessa, 420,888; Kharkov, 417,186; Rostov-on-Don, 308,284; Tashkent, 323,613; and Tiflis, 292,973.

EDUCATION. Public education in the Soviet Union is a charge against the six constituent republics and against the localities concerned. Local appropriations are in the aggregate somewhat larger than those of the republican government. Total appropriations for education were upward of \$400,000,000 in 1927-28, as compared with \$317,200,000 in 1926-27 and \$236,400,000 in 1925-26. In the autumn of 1928 the Central Statistical Board reported that 11,372,507 children were in primary and secondary schools (excluding kindergartens), 46 per cent more than before the World War. There were 118,184 schools as compared with 106,400 in 1913. The teaching

staff numbered 337,435. In the cities, 98.4 per cent of the children of school age were in school, and in the villages 66.4 per cent. In the teaching in various schools throughout the country, a total of 70 national tongues were used. Since the famine year of 1921, enrollment in the schools had shown a steady growth. In colleges and universities the growth had been commensurate. There were 136 of these institutions in 1926-27 with an enrollment of 168,000. In addition, 1,642 higher trade schools had 243,810 students. The warfare against illiteracy was conducted in 54,600 schools for adults with 1,317,000 pupils, as compared with 1,600,000 pupils the previous year. These schools for adults were conducted largely under voluntary auspices, particularly by the labor organizations.

Among the general population (above seven years) illiteracy had decreased by one-third in the past six years. The census of 1926-27 revealed that 65.4 per cent of the males were literate and 36.7 per cent of the females. In the last pre-war census (1897) the figures were, respectively, 37.9 and 12.5 per cent.

PRODUCTION, ETC. Land and natural resources are held in trust by the Government for the general population, and may not be acquired by private title. Every citizen is entitled to secure land for cultivation, the form of tenure being that of perpetual leasehold. Natural resources are exploited by State trusts, by mixed companies, under concession, in which the State has a participating interest; or by private companies under concession. Such private concessions run for a limited time (generally 15 years). The transport system, and the posts, telephones, and telegraphs are operated as government departments. Industry is conducted largely by State trusts. Private factories employing not over 20 persons may operate without formality. For enterprises employing 21 to 100 persons permission of local authorities is required, and for larger enterprises a special leasing or concession agreement from the Government is necessary.

Many industrial enterprises are run by the co-operatives. These organizations had increased their membership from 10,000,000 in the fall of 1924 to 35,000,000 in 1928. They conduct over 50 per cent of the internal trade and 10 per cent of the foreign trade. The consumers co-operatives alone had some 75,000,000 stores at the beginning of 1928 and their turnover in 1926-27 was over \$5,000,000,000.

In October, 1928, the Central Statistical Board reported a grain crop of 74,764,000 metric tons from 98,698,000 hectares, compared with 74,128,000 metric tons in 1927. The wheat crop (included above) was 22,399,000 metric tons as compared with 20,389,000 in 1927. Total pre-war production of all grain in the same territory was estimated at 75,000,000 metric tons. The cotton crop of 1928 was estimated at 860,000 tons (unginned), as compared with 632,000 metric tons in 1927 and 744,300 in 1913. The sugar-beet crop was 10,641,000 metric tons, as compared with 9,863,000 metric tons in 1927 and 10,230,000 in 1913. Other technical crops registered gains, except sunflower seed, which showed a decline of 16 per cent from 1927. At the beginning of 1928, horses numbered 30,931,000; cattle, 67,327,000; swine 20,222,000. All livestock except horses was above the pre-war figure. In the autumn of 1928 there were 32,000 tractors in use, as compared with 500 in 1913. Owing to the

fact that the grain crop of 1927 was about 2,000,000 metric tons less than that for 1926, coupled with increased consumption, grain exports for the agricultural year ending June 30, 1928, fell to 512,000 metric tons, from 3,068,000 the previous year.

The industrial output for 1927-28 (fiscal year ending September 30) was over 20 per cent above 1926-27 and 25 to 30 per cent above the pre-war level. The year was the first since the War in which the industrial advance was dependent wholly on new construction and equipment. In 1921 the industrial output was only 15 per cent that of 1913. The only large-scale industry still below the pre-war level in 1928 was that of ore mining. Upward of 85 per cent of the industrial output was from large State trusts operating under the general supervision of the Supreme Economic Council under a plan of balanced economy drawn by the State Planning Commission (Gosplan), which acts as a sort of economic general staff.

In the autumn of 1928 it was announced that \$850,000,000 had been allotted for capital improvements in State industry for 1928-29, as compared with \$610,000,000 in 1927-28. The funds are derived from profits, depreciation account, and governmental budget appropriations. They do not include money expended for the development of electrification. The allotments for 1928-29 included \$125,000,000 for the iron and steel industry, \$114,000,000 for the oil industry, \$112,000,000 for the textile industry, \$82,000,000 for the coal industry. The average number of workers employed in large-scale State industry was 2,103,000 during the first half of 1927-28, as compared with 2,012,000 in 1926-27.

Three large-scale development projects were inaugurated in the Soviet Union, which were expected to accelerate materially the advances in productivity. These were: (1) the Dnieper River hydro-electric development, with attendant waterway and irrigation projects. This includes the construction of a power plant of 650,000 horse power, the largest in Europe (somewhat larger than Muscle Shoals in the United States), the building of sluiceways which will extend the navigability of the Dnieper by 800 miles, and the irrigation of hundreds of thousands of acres of arid land. Col. Hugh L. Cooper, builder of Muscle Shoals, was chief consulting engineer. The total cost of the work, which was begun in 1927, was to be \$100,000,000. (2) The Siberian-Turkestan Railway, 920 miles long, was to connect the cotton belt in Central Asia with the grain and timber districts of Siberia, cutting the present railway distance between the two sections by 65 per cent. Construction was begun in 1927 and the total cost was to be \$100,000,000. (3) The Volga-Don Canal, connecting the two rivers, was to give the Volga, the chief waterway of the Soviet Union, which empties into the landlocked Caspian Sea, an open water outlet on the Black Sea. The project involves the creation of a deep-water port at Rostov-on-Don and the construction of a ship canal, 60 miles long, connecting the two rivers. Final plans were approved in the fall of 1928. The Dnieper project and the Siberian-Turkestan railway were to be completed in 1932.

The total ascertained coal deposits in the Soviet Union were estimated at 474,673,000,000 metric tons, of which approximately one-eighth was anthracite. Production of State trusts

in 1927-28 was 34,111,000 metric tons as compared with 30,940,000 in 1926 and a total production of 28,356,000 in 1913. In addition, various private enterprises produce about 1,500,000 annually.

Oil production for 1927-28 was 25 per cent above 1913 and oil exports were nearly triple the pre-war volume. The output was 11,502,000 metric tons as compared with 10,184,000 in 1926-27 and 9,215,911 in 1913. Exports were 2,673,700 metric tons, as compared with 2,038,800 in 1926-27 and 914,032 in 1913. The increase in production for the year was 13 per cent and in exports 34 per cent. During 1928 it was announced that under various contracts the Standard Oil Company of New York and the Vacuum Oil Company were purchasing annually from the Soviet Naphtha Syndicate oil products worth \$10,000,000. During the year a contract was concluded with the Spanish Oil Monopoly whereby that organization purchases from the Soviet Syndicate oil amounting to about half the Spanish consumption. Oil resources of the Soviet Union are estimated at 2,883,800,000 metric tons.

The Soviet textile industry increased its output materially in 1927-28 and ran well above pre-war level. The cotton industry turned out 314,000 metric tons of yarn, as compared with 268,400 in 1926-27, and 2538 million meters of finished cloth, as compared with 2343 in 1926-27. The woolen industry produced 48,100 metric tons of yarn, as compared with 41,243 in 1926-27. The output of the linen industry was 2 per cent less than in 1926-27.

In the metal industry the output increased 23.5 per cent in 1927-28, largely due to marked advances in concentration of machinery, and in manufacture of railway equipment and in shipbuilding. In the industry as a whole, the output was 21.5 per cent higher than in 1913. Production of rolled iron and steel reached approximately the pre-war figures, while that of pig iron was 78 per cent of the output for 1913. Statistics of iron and steel production, in metric tons was as follows:

	1927-28	1926-27	1913
Pig iron	3,283,000	2,963,000	4,206,000
Steel	4,150,000	3,586,000	4,247,000
Rolled iron	3,367,000	2,731,000	3,509,000

Large increases were registered in many other industries during 1927-28, notably the electrical industry, which had an output of \$114,000,000, nearly triple the pre-war figures, the chemical, leather, rubber, and paper industries. The newspapers of Moscow were supplied with domestic newsprint paper in the autumn of 1928 for the first time in history. The new paper plant which was under construction at Balakhna would supply 60,000 tons of newsprint yearly. The gold and platinum industries are now in the process of expansion.

The Soviet Government was pushing the development of a comprehensive superpower scheme in which over a score of plants were in operation in 1928. Consumption of electric power in that year was quadruple the pre-war rate. Expenditures for new construction in 1928-29 were to amount to \$175,000,000, of which \$100,000,000 was appropriated from the Federal budget, as compared with \$75,000,000 in 1927-28. The remainder was to be expended by localities and industrial enterprises.

COMMERCE. The foreign trade turnover over all frontiers is shown in the following table:

1913	\$1,490,495,000
1922-23	199,800,000
1923-24	484,910,000
1924-25	666,925,000
1925-26	733,130,400
1926-27	762,869,500
1927-28	886,830,000

The unfavorable balance of trade for 1927-28 was \$88,580,000, as compared with a favorable balance of \$28,989,500 for 1926-27. The change was due to the big drop in grain exports. Exports other than grain increased in 1927-28 by 33 per cent. The trade over the Asiatic frontiers, which is principally with Persia, China, and Japan, increased by about 50 per cent in 1927-28. The trade over the European frontiers was: Exports, 635,481,000 rubles, imports, 820,059,000 rubles, total, 1,455,540,000 rubles (\$744,453,000) an increase of 12 per cent over the previous year.

The principal exports are grain, oil products, furs, timber, butter, eggs, manganese, ore, and oil cakes. The principal imports are raw cotton, industrial machinery, agricultural machinery, including tractors, metals, leather, wool, tea, and paper. In 1927-28 nearly 90 per cent of the imports consisted of production goods, i.e., raw materials and machinery.

The principal countries taking Soviet exports are England (26 per cent), Germany (22 per cent), Latvia (7.5 per cent), France (7 per cent), and Persia (5.6 per cent). The principal countries furnishing Soviet imports are Germany (23 per cent), United States (20.5 per cent), England (14.2 per cent), and Persia (5.4 per cent). See Table on page 671.

The principal Soviet imports from the United States are cotton, industrial equipment, agricultural machinery, metals, chemical products, binder twine, automotive equipment, and typewriters and adding machines. According to figures of Soviet trade organizations in the United States, purchases of American products for shipment to the Soviet Union in 1927-28 aggregated close to \$100,000,000, or about two and a half times the annual pre-war figure.

The extent of Soviet purchases in the United States, in recent years is shown in a table, page 671.

The principal Soviet exports to the United States are furs, manganese, precious metals, sheep casings, flax and tow, hides and skins, bristles, and licorice root.

The figures for American-Russian trade by Soviet customs statistics, are as follows:

	Exports to United States	Imports from United States
1913	\$7,290,000	\$40,730,000
1923-24	4,377,500	49,955,000
1924-25	14,471,500	103,618,000
1925-26	15,759,000	62,881,500
1926-27	11,948,000	74,984,000
1927-28	14,986,500	96,459,500

FINANCE. By the end of June, 1924, Soviet currency was established on a gold basis, and since that time there have been no unsecured paper issues. The budget of Soviet fiscal years, ending September 30, in millions of rubles (1 ruble equals \$0.515) were as follows:

	1924-25 (actual)	1925-26 (actual)	1926-27 (actual)	1927-28 (actual)
Revenues	2,905.1	3,900.7	5,201.3	6,350.8
Expenditures ...	2,875.6	3,867.8	5,151.3	6,239.1

SOVIET IMPORTS ACROSS EUROPEAN FRONTIERS

(Fiscal year beginning October 1)

[In rubles: 1 ruble = \$0.515]

	1924-25	1925-26	1926-27	1927-28
Industrial Equipment	68,891,000	108,741,000	146,406,000	247,300,000
Raw Materials and Semi-manufactured Products	315,897,000	365,298,000	381,617,000	435,983,000
Including:				
Cotton	121,897,000	104,450,000	120,651,000	134,866,000

SOVIET PURCHASES IN THE UNITED STATES BY COMMODITY GROUPS

	1925-26	1926-27	First half 1927-28
Raw Materials			
Semi-Manufactured Goods	\$34,515,306	\$50,230,991	\$48,982,994
Industrial and Electrical Equipment	622,974	1,924,948	1,122,370
Automotive Equipment	4,085,742	10,867,479	6,928,150
Agricultural Machinery, Livestock, etc.	291,311	1,614,166	1,236,005
Consumers' Goods	8,117,053	6,617,953	6,726,240
	1,060,911	716,715	473,440
Total	\$48,693,297	\$71,971,715	\$65,469,199

Revenues for 1927-28 showed gains in all departments except the agricultural tax, as compared with the preceding year. Revenues from loans were 670,000,000 rubles, an increase of 142 per cent over the same period of the preceding year. The Federal budget for 1928-29 was fixed in preliminary figures at 6,970,000,000 rubles.

Currency in circulation on Sept. 1, 1928, was 1,803.1 million rubles, as compared with 1,670.8 million rubles on Oct. 1, 1927. The retail price index (prices of 1913 equal 100) as of Oct. 1, 1928, was 210.8 as compared with 198 as of Oct. 1, 1927. The wholesale price index was 176.1 as compared with 170 the previous year. The balance sheet of the State Bank as of Oct. 1, 1928, showed liabilities and assets of 4,371,397,000 rubles, an increase of 508,203,000 rubles as compared with Oct. 1, 1927. The capital was 250,000,000 rubles. Deposits and current accounts were 1,553,125,000 rubles, an increase of 260,196,000. Assets of bullion, coin, precious metals, and foreign currency were 291,022,000 rubles, a decrease of 8,900,000.

TRANSPORT. In 1928 the railway mileage of the Soviet Union had reached 47,940, as compared with about 36,000 in 1913 and 42,000 miles in 1917. Under the five-year plan drawn up for the railways, construction of 11,500 miles of line is projected during the period to cost \$950,000,000. In 1926-27 revenues from operation were \$768,277,000 and expenditures \$650,960,000, giving a net profit of \$117,317,000, as compared with \$91,567,000 the previous year. Average daily freight loadings were 31,183, as compared with 27,868 the previous year. New loco-

motives built in Soviet plants during 1927-28 numbered 480, as compared with 441 the previous year. Freight carried in 1926-27 was 82,607 million ton-kilometers as compared with 65,695 in 1913. There were 7000 miles of airplane lines in operation in 1928.

GOVERNMENT. A description of the constitution of the Union of Soviet Socialist Republics will be found in the YEAR BOOK for 1923. At the close of 1927, the Council of People's Commissars, the executive cabinet of the Soviet Government, was composed as follows: Chairman of the Council of People's Commissars, Alexi I. Rykov; vice-chairmen of the council, J. E. Rudzutak, V. V. Schmidt, and V. V. Kuybyshev; Commissar for Army and Navy, K. E. Voroshilov; for Trade, A. I. Mikoyan; for Foreign Affairs, George Tchitcherin; for Transportation, J. E. Rudzutak; for Posts and Telegraphs, N. K. Antipov; for Finance, N. P. Briukhanov; for Labor, V. V. Schmidt; for Peasants and Workers' Inspection, G. K. Orjonikidze; Chairman of the Supreme Economic Council, V. V. Kuybyshev; Director of Central Statistical Administration, V. P. Miliutin, Chairman of the Central Executive Committee of the Soviet Union, M. I. Kalinin, G. I. Petrovsky, A. G. Cherviakov, Gazanfar Mussabekov, Netyrbay Aitakov, Faizulla Khodzhaev. These chairmen of the Central Executive Committee are the presidents of the six constituent republics.

HISTORY

FOREIGN RELATIONS. The most important event in the field of foreign affairs in 1928 was the participation of Soviet delegates in the

Geneva disarmament conference in March. Mr. Litvinov, assistant Commissar for Foreign Affairs, as Chairman of the Soviet delegation, presented for the consideration of the conference a carefully worked out plan for complete disarmament among the nations. This provoked a sharp discussion.

The German and Turkish delegations were the only ones favorable to the Soviet proposals. When the proposals were rejected, Mr. Litvinov presented alternative plans for gradual partial disarmament. These also met with no encouragement from the majority of the delegates. Despite these rebuffs, the Soviet delegates, before departing, expressed confidence that their proposals had released a widespread public discussion of the idea of disarmament, and had thus been a service in the cause of international peace. On August 29, the Presidium of the Central Executive Committee of the Union of Soviet Socialist Republics passed a resolution of adherence to the Kellogg Pact, signed in Paris, August 27.

Soviet business relations with large American industrial units received a decided impetus during the year through the conclusion of a number of commercial and technical contracts. The principal contract was between the International General Electric Company of New York and the Amtorg Trading Corporation, the chief Soviet trading agency in the United States. The agreement provided for purchases of equipment up to \$28,000,000 from the General Electric Company, over a period of six years, on credit terms extending up to five years, and for the establishment of a technical bureau in Moscow by the American firm. Another contract between the Radio Corporation of America and the Soviet Electrical Trust called for exchange of patents and information, with a proviso for technical consultation services in the Soviet Union from the American corporation. Contracts for the sale of Soviet oil products to the Standard Oil Company and the Vacuum Oil Company were continued and extended. Several new contracts with American technical organizations were concluded, and existing agreements with such firms as Hugh L. Cooper & Company of New York, the Freyn Engineering Company of Chicago, and Stuart, James & Cooke of New York were renewed and expanded.

INTERNAL AFFAIRS. Several important developments in internal policy were announced during 1928. Energetic measures were set in motion to cope with the decline in grain exports, which resulted, according to Soviet economists, from sharp increases in per-capita consumption, along with an annual increase of 3,000,000 in the population, rather than any falling off of grain placed on the market. In the old days the export surplus came from the large estates, which have disappeared. The plans adopted were threefold. (1) Provision for better seeds and machinery and for better agricultural methods. (2) Rapid expansion of the coöperative farms, with their higher rate of cultivation, so that they will include 18,000,000 acres by 1933. (3) Development of large State grain-growing areas of 75,000 to 100,000 acres each, with the latest farm methods and machinery, these to cover 15,000,000 acres by 1933. These plans were put under way in the summer of 1928. In the fall 5700 tractors were purchased in the United States to speed up agricultural production.

Another development of importance in 1928 was the extension and liberalization of the policy of granting concessions to foreigners. The new policy included the importation of construction materials duty free and simplification of the taxing scheme. Fields thrown open to the concessionaires included mining, production of machinery, paper pulp, rayon, automobiles, leather, fuel, electric plants, timber, dairying, cotton and sugar growing, building construction, and also public-service concessions in 60 cities. There were 110 foreign concessions in operation at the beginning of 1928. During the year announcement was made of the relinquishment by the W. A. Harriman Company of their manganese concession at Chiaturi, owing to the fact that the drop of 50 per cent in the world price of manganese since the concession was signed in 1925 made further operation unprofitable. The \$3,450,000 invested by the Harriman firm was to be repaid during the next 15 years, with 7 per cent annual interest.

A serious conspiracy to sabotage the coal industry of the Donetz Basin was uncovered in the Soviet Union early in 1928. As a result 53 engineers, including the chief technical director of the mines, were placed on trial charged with entering into a conspiracy with a group of former owners to wreck the Soviet industry. The accused persons included three German engineers, who were acquitted, along with one other defendant. Five convicted conspirators were sentenced to death and others received prison terms. It is interesting to note that the American engineering firm of Stuart, James & Cooke, which was engaged in building new mines in the district, became cognizant of serious misadministration by the beginning of 1928 and gave warning to the higher Soviet authorities several weeks before the first arrests were made.

At the beginning of 1928 Trotzky and other members of the opposition group who had been expelled from the Communist party were ordered to various more or less remote posts in the provinces. During the year many members of this group made up their differences with the party majority and returned to various administrative positions. Trotzky and some of his lieutenants continued to maintain an intransigent attitude.

RUST. See BÖTANY, under *Plant Diseases*; FORESTRY, under *Insects and Diseases*.

RUTGERS UNIVERSITY. A non-sectarian institution of higher learning at New Brunswick, N. J., founded under the name of Queen's College, in 1766. The university consists of the following colleges: Arts and sciences, engineering, agriculture, school of education, college for women. The registration for the autumn term of 1928 was 2440, of whom 1082 were women registered at the Women's College. The 1928 summer session had an enrollment of 1532. Of the 235 members on the faculty, 150 were professors and 85 instructors. The endowment funds amounted to \$3,854,823, and the income for the year, exclusive of the State Agricultural Experiment Station, amounted to \$2,353,880, while lands, buildings, and endowments had a total valuation of more than \$12,000,000. The library contained 172,100 volumes. During the year a music building was erected for the Women's College. President, John M. Thomas, D.D., Litt.D., LL.D.

RYAN, THOMAS FORTUNE. American financier, died at New York, November 23. He was born in Nelson County, Va., Oct. 17, 1851, the son of a small-town tailor. Moving to Baltimore in 1868, he was employed in a dry-goods store, and two years later he went to New York, and entered Wall Street, where in 1874 he bought a seat on the Stock Exchange. Becoming associated with William C. Whitney, he was soon recognized, as a leading influence in many important enterprises, especially street railways and other public utilities. He and his associates financed the consolidation and extension of street-car and lighting systems in New York, Chicago, and elsewhere. He acquired the controlling stock in coal properties in Ohio and West Virginia, and was largely interested in coal and railway companies in Virginia. Mr. Ryan became interested about 1900 in Belgian corporations which were developing mining in the Congo, and was said to be one of the largest individual owners of African diamond fields. In 1912 he made heavy investments in Portuguese Angola. From 1898, he was identified with the American Tobacco Company, and was a controlling factor in the tobacco market in the United States. Mr. Ryan went to England in the summer of 1902, when competition with the Imperial Tobacco Company was becoming acute, and settled the conflict in terms advantageous to the American industry. He was credited with having averted a financial panic in 1905, by securing control of the Equitable Life Assurance Society of the United States and then transferring his 502 shares, for which he had paid \$2,500,000 and which he later sold to J. P. Morgan, to a group of trustees who held the public confidence. When he partially retired in December, 1908, he was officer or director, and principal stockholder in more than thirty corporations, retaining his directorship of the Guaranty Trust Company, the Carolina, Clinchfield & Ohio Railway, and the Clinchfield Coal Corporation.

Mr. Ryan contributed largely to the funds of the Democratic party, and was a delegate from Virginia to the Democratic National Convention in 1904, serving again in 1912. Mr. Ryan gave generously to various charities, especially to the Roman Catholic Church, and in 1912 donated \$1,000,000 for the construction of the Roman Catholic Church of St. Jean Baptiste in New York City. He collected many rare works of art, showing a special interest in Renaissance statuary and painting.

RYE. The production of rye in 1928 by 25 countries reporting to the International Institute of Agriculture, Rome, was placed at 1,674,600,000 bushels as against 1,776,500,000 bushels in 1927, representing a decrease of 5.7 per cent and a slight increase over the average production for the five-year period 1922-1926. The area devoted to the crop in these countries was reported as 104,581,000 acres or 6.5 per cent below the acreage of the preceding year and 7 per cent below the five-year average. The leading rye-growing countries outside the United States reported the following yields: United Socialist Soviet Republics, 783,433,000 bushels; Germany, 303,285,000 bushels; Poland, 232,358,000 bushels; Czechoslovakia, 52,677,000 bushels; France, 35,362,000 bushels; and Hungary, 32,523,000 bushels. Argentina, the leading rye-producing country of South America, produced 6,614,000 bushels

in the crop year 1927-28. The production in Canada in 1928 was estimated at 16,879,000 bushels or 1,928,000 bushels above the crop of 1927.

Estimates based on the reports from 35 States, as published by the U. S. Department of Agriculture, placed the production of the United States in 1928 at 41,766,000 bushels on 3,444,000 acres, or at the rate of 12.1 bushels per acre. In 1927, the yield was 58,164,000 bushels, the area 3,648,000 acres, and the average yield per acre 15.9 bushels. Decreases in acreage and in acre yield accounted for the decline in total production in 1928. The average farm price on Dec. 1, 1928, was 86.4 cents per bushel as compared with 85.3 cents, the corresponding price the year before. Based on the prices, the total value of the crop of 1928 was \$36,067,000, and of the crop of 1927, \$49,609,000. The production in the leading States was as follows: North Dakota, 12,710,000 bushels; Minnesota, 5,950,000 bushels; Nebraska, 3,486,000 bushels; Michigan, 2,366,000 bushels; Wisconsin, 2,171,000 bushels; and Montana, 2,156,000 bushels. The other States producing over 1,000,000 bushels were Pennsylvania, South Dakota, and North Carolina. Due to a reduction of 110,000 acres in acreage and 6.7 bushels in the average yield per acre, the production of North Dakota, as compared with the preceding year, showed a decline of nearly 45 per cent.

The average yield of rye per acre in 1928 was 10 bushels in North Dakota, Georgia, South Dakota, Arkansas, Tennessee, and Utah. The highest average yields per acre, 18 and 18.5 bushels, respectively, were reported for Iowa and New Jersey. The average farm price per bushel on Dec. 1, 1928, varied from 69 cents in Montana to \$1.85 in South Carolina. In nearly half of the States reporting, mostly Eastern and Southern States, this price was more than one dollar.

For the year ended June 30, 1928, the United States exported 26,044,000 bushels of rye and 47,000 barrels of rye flour as compared with 21,613,000 bushels of grain and 14,000 barrels of flour in the preceding fiscal period.

SAAR BASIN. *zür.* According to Article 45 of the Treaty of Versailles, this section of Germany was awarded to France for the purpose of exclusive exploitation of the coal fields, in compensation for the destruction of the coal fields in northern France by the German armies. The treaty provided that for 15 years the Saar Basin should be governed by a commission of five appointed by the League of Nations, and that after that period the population should decide on one of three courses; namely, the administration set up by the treaty, union with France, or union with Germany. Area, 751 square miles; population, about 657,870.

SACRAMENTO VALLEY FLOODS. See FLOODS.

SAFETY, INDUSTRIAL. See NATIONAL SAFETY COUNCIL.

SAFETY AT SEA. For the fiscal year ended June 30, 1928, the U. S. Steamboat Inspection Service of the Department of Commerce reported the following statistics: Total number of accidents resulting in loss of life, 232, or an increase of 21 over the previous year; total number of lives lost from all causes, passengers and crew, 275, an increase of 13 over the previous year. Of

the lives lost, 142 were from suicide, accidental drowning, and other causes beyond the power of the service to prevent, leaving a total of 133 fairly chargeable to accidents, collisions, foundering, etc. The number of lives saved during the year by means of life-saving appliances required by law was 419. The number of passengers carried during the fiscal year on steam vessels that are required by law to report the number of passengers carried was 230,874,907, of whom 81 were lost, making an average of 2,850,807 who were carried for each passenger lost. The total loss in property from such causes as explosion, wreck, or founder, collision between vessels, fire, snags, and miscellaneous causes, amounted to \$10,079,553.

The report of the Supervising Inspector General of the Steamboat Inspection Service showed further that 7118 vessels, with a gross tonnage of 15,386,528, including 6815 domestic vessels with a total gross tonnage of 11,840,138, and 303 foreign passenger steam vessels, with a total gross tonnage of 3,546,390, were inspected during the fiscal year. Of the domestic total inspected, 5302 were steam vessels, 1072 motor vessels, 17 passenger barges, and 424 seagoing barges. The increase in the total gross tonnage of vessels inspected as compared with the previous fiscal year was 73,907, but there was a decrease of 239 in the total number inspected. Additional inspections included 1044 cargo vessels examined to carry persons, besides crew, and 63 hulls of vessels and 2035 boilers for the United States Government. Licenses were issued to 24,773 officers of all grades, certificates of service were issued to 7944 able seamen, and certificates of efficiency to 6721 lifeboat men.

Following is a list of disasters at sea during 1928, many of which resulted in unusually large losses of life:

January 15. The American steamer *City of Pittsburgh*, towing ten empty barges and one loaded fuel barge, collided with the motor ferry vessel, *Hilda*, in the Mississippi River, opposite Norco, La., drowning seven passengers.

January 28-29. During the night the towing steamer, *Baldrock*, with loaded coal barges, *Aranas*, *Catonsville*, and *Nahant*, in tow, became separated from her tow in a heavy gale off Barnegat, N. J., resulting in the foundering of the *Aranas* and *Catonsville*, with a loss of three lives on each of the foundered boats.

February 15. The American tank steamer, *Chukky*, experienced an explosion which broke her in two amidships, resulting in the loss of the lives of 15 members of the crew, about 200 miles off the coast of Japan, the 21 members of the crew who escaped in a life boat being picked up by a Japanese fishing vessel.

April 9. The Canadian Pacific liner, *Montrose*, bound for Liverpool, struck an iceberg three days out of St. John, New Brunswick, resulting in the death of two of the crew and a narrow escape from sinking for the ship.

May 4. The Greek steamer, *Ioannis Fafalios*, sank in collision with the Royal Fleet Auxiliary, *Bacchus*, in the English Channel, and 12 of the crew of 22 were lost at sea or died en route to Portland.

May 7. The United States Army dredge, *Navesink*, was sunk in a collision in New York Harbor, with a loss of 17 lives.

May 31. The steamers, *Kershaw* and *President Garfield*, collided in Vineyard Sound, Mass. The former was sunk and 11 of the crew were lost.

July 7. The Chilean transport, *Angamos*, was totally destroyed when driven on the rocks at Punta Morguillas, south of Lebu, only four of the officers and crew of 215 and 80 Chilean civilians surviving.

July 17. French Indo-China steamer, *Cap Lay*, foundered at the mouth of Songtambo River and 40 lives were lost.

Aug. 6. Italian submarine, *S-14*, collided with a destroyer in the Adriatic Sea during manœuvres, with a loss of 27 lives.

November 12. The liner, *Vestris*, a British-owned vessel, en route from New York to Barbados, Rio de

Janeiro, and Buenos Aires, sank off Virginia Capes following a hurricane which damaged the boat. The official list of survivors reported 60 passengers and 151 of the crew saved, leaving 115, including 69 passengers and 46 of the crew, unaccounted for. Survivors were brought to New York by the steamships, *American*, *Shipper*, and *Berlin*, and the tanker, *Myriam*.

November 15. The British lifeboat, *Mary Stanford*, of Rye, England, capsized in a raging sea a mile from shore after putting out to sea in answer to a call from the *Alice*, of Riga, in distress off Dungeness. Seventeen of the crew were drowned.

December 10. The White Star liner, *Celtic*, grounded on a reef at the entrance to Cork Harbor early in the morning. All of the passengers, approximately 250, including 25 of the *Vestris* crew, and the mail were landed safely at Queenstown. The vessel suffered a heavy loss.

SAID MOHAMMED PASHA. Egyptian statesman, died July 21. His first public office was that of minister of the interior under Boutros Pasha Ghali in 1908, and when his chief was murdered in 1910 he became premier. He worked in harmony with the British Consul General and agent in Egypt, Lord Kitchener, but a dispute with the Khedive, Abbas Hilmi Pasha, resulted in his resignation in April, 1914. In the troublous times of 1919, Said Pasha formed a non-political ministry and in the same year had a narrow escape from assassination. He resigned in November, 1919, but went into office again in 1924 as minister of education in the Zaghlul Government. Shortly afterward he accepted the portfolio of minister of justice, and was acting premier during Zaghlul's visit to Europe. He resigned in October, 1924, and in January, 1925, gave up his membership of the Wafd, as he opposed Zaghlul. He was later elected an independent member for Alexandria.

ST. CHRISTOPHER or ST. KITTS. See LEEWARD ISLANDS.

ST. FRANCIS DAM DISASTER. See DAMS; and CALIFORNIA under *History*.

ST. HELENA. An island of volcanic origin in the South Atlantic, about 1200 miles from the west coast of Africa, and belonging to Great Britain. Area, 47 square miles; population, according to the census of 1921, 3747; estimated civil population, Dec. 31, 1926, 3728. Capital and seaport, Jamestown. The chief occupation is the fibre industry, and fibre and tow are the principal exports. In 1926 the exports were valued at £39,977 and the imports at £56,040; revenue £23,944, expenditure, £23,154; there is no public debt. A detachment of the Royal Marine Artillery is stationed on the island, which is also a coaling station for the British Navy. Governor in 1928, C. H. Harper.

ST. JOHN'S COLLEGE. A college of liberal arts and sciences for men at Annapolis, Md., founded as King William's School in 1696. The enrollment for the autumn term of 1928 was 266, and there were 27 members on the faculty. The College grants the A.B. degree only. Freshmen are given orientation courses in literature and the social sciences. The endowment funds amounted to \$184,659, and the yearly income to \$198,594. The library contained 18,212 volumes. President, Enoch B. Garey, LL.D.

ST. LAWRENCE UNIVERSITY. An institution for the higher education of men and women at Canton, N. Y., founded in 1856. The registration for the autumn term of 1928 was 4170, distributed as follows: College of letters and science, 830; theological school, 28; law school, 3312. The faculty numbered 124, divided among the several schools as follows: Letters and science, 48, of whom 6 were additions during the

year; theological, 4; law, 40; special lecturers, 8. The endowment funds amounted to \$2,316,520, and the income for the year to \$162,133. The library contained 52,600 volumes. During the year, Richardson Hall was erected in Brooklyn for the law school, and a gift of \$100,000 was received from S. L. Carlisle & Co., of New York City, to be payable at the rate of \$20,000 annually, and to be used by the university to promote the teaching of forestry. President, Richard Eddy Sykes, D.D.

ST. LOUIS. See MISSOURI.

ST. LUCIA, 160°shf-a. A British insular colony in the Windward group of the West Indies. Area, 233 square miles; population in 1926, 55,698. Castries, the chief port and capital, is a naval base and coaling station. The movement of population in 1926 was: Births, 2120; deaths, 1230; marriages, 255. On Dec. 31, 1926, there were 42 Roman Catholic and 7 Protestant schools, with 8564 pupils enrolled. The chief products are cacao, sugar, lime juice, lime oil, bay oil, honey, hides, logwood, rum, fuel, molasses, and syrup. Imports in 1926 were valued at £252,236; exports, at £251,705. Of the imports the largest share came from the United States and of the exports the largest share went to Great Britain. The total shipping in the same year was 1,071,957 tons, of which 848,997 tons were British. Revenue in 1926, £83,379; expenditure, £84,488; public debt, £206,600. The island is under an administrator aided by a nominated executive and a party nominated and partly elected Legislative Council.

ST. PAUL. See MINNESOTA.

ST. PIERRE AND MIQUELON, mē-ke-lôn'. Two small groups of islands belonging to France, close to the southern coast of Newfoundland, and named from their two largest islands. Area of the St. Pierre group, 10 square miles; population in 1921, 3419; area of the Miquelon group, 83 square miles; population in 1921, 499. The islands are rocky and unsuited to agriculture, their main importance being as a centre for the cod-fishing industry. The chief town is St. Pierre, which has regular steamship communication with North Sydney and Halifax. In 1924 the imports totaled 149,075,355 francs; the exports, 142,804,699 francs. The imports consisted chiefly of textiles, salt, wines, foodstuffs, and meat; the exports, cod, dried and fresh, and fish products. The local budget for 1927 was: Revenue, 8,985,250 francs; expenditure, 8,983,469 francs. The islands are under a governor aided by consultative and municipal councils.

ST. THOMAS. See SAO THOME AND PRINCIPE.

ST. VINCENT. A British insular colony in the Windward group of the West Indies. Area, 150.3 square miles; population 1926, 49,751. Kingstown, with a population of 3836 in 1921, is the capital. The movement of population in 1926 was: Births, 1963; deaths, 966; marriages, 153. In the same year there were 28 primary schools with an average attendance of 2892. The chief products are arrowroot, sugar, cotton, rum, cacao, and spice; cotton (Sea Island) being especially important and regarded as the best grown in the British Empire. In 1926 the imports were valued at £203,606; exports, £162,909; revenue, £60,243; expenditure, £59,282; public debt, £9730; total shipping, 416,136 tons. One-half of the Grenadine Islands are under the administration of the island of St. Vincent and the other half under Grenada (see GRENADA). At the head of the administration is an admin-

istrator and colonial secretary, who is aided by a legislative council consisting of official, elected, and nominated members. Administrator in 1928, R. Walter.

SAKHALIN, sā'kă-lyên'. An island off the eastern coast of Siberia, separated from Japan by the narrow Strait of Soya. The portion south of the 50th parallel of N. latitude belongs to Japan; north of that line lies the Province of Sakhalin, belonging to Russia. Japanese Sakhalin or Karafuto (see KARAFUTO), has an area of about 13,934 square miles and a population, according to the census of 1925, of 203,504. The area of the Russian province is 14,688 square miles, with a population estimated at 34,000 in 1915. The northern half is covered with forests to the extent of 80 per cent of the entire area.

SALOMON COLLECTION. See ART SALES.

SALVADOR, sā'l'vā-dōr'. A Central American republic situated to the east of Guatemala on the Pacific coast. Capital, San Salvador.

AREA, POPULATION, ETC. The area is estimated at 13,176 square miles; the population on Jan. 1, 1927, was estimated 1,657,000. The mestizos or mixed races numbered 1,307,200 and the Indians 326,800. San Salvador has a population of 87,000. Other large towns with their populations at the same time were: Santa Ana, 74,200; San Miguel, 37,000; Santa Tecla, 28,000; San Vicente, 33,000; and Sonsonate, 16,283. In 1926 there were 60,391 births and 37,405 deaths.

EDUCATION. Education is free and obligatory from 7 to 14 years of age. During the 1927 school year there were 1557 primary teachers in 859 government schools, while the number of pupils registered was 47,467. The National Conservatory of Music, the Theatrical School, and the National School for the Blind were established. The registration in the Conservatory was 273 pupils and in the Theatrical School 28. There were 18 private schools and 6 commercial schools of secondary rank. In the National Institute, where 275 students were entered, the first experiment in coeducation was successfully carried on.

PRODUCTION, ETC. Salvador is chiefly an agricultural country. The fertile soil of the mountain slopes is excellently adapted to the cultivation of coffee. This commodity is the basic money crop of the Republic and it normally accounts for approximately 90 per cent of the total exports. It was estimated that the 1927-28 crop was unusually large, amounting to well over 800,000 bags. Sugar is the second most valuable export crop, although amounting to less than \$1,000,000. The cultivation of henequen is of comparatively recent introduction into Salvador and, while it is only one of the secondary crops, its acreage was being steadily extended. Cotton, which reached its highest production in 1925, was no longer cultivated to any extent and was unimportant as an economic factor. Exports decreased from 535,635 kilos in 1926 to 49,665 in 1927. Among the other agricultural crops are balsam, indigo, tobacco, and rubber. The most important native crops are corn, beans, and rice.

Gold and silver are found in commercial quantities, but their production is seriously hampered by lack of fuel. Salvador is so dominated by agriculture that little attention has been given to manufacturing. The principal manufacturing industries cater exclusively to local requirements. They consist chiefly of the making of soap, candles, shoes, leather goods, textiles, and other small local necessities.

COMMERCE. The total value of Salvador's exports in 1927 amounted to \$14,100,000, as compared with \$24,600,000 in 1926, a decrease of \$10,500,000, or 42 per cent. This figure is the exact difference in the values of the 1926 and 1927 coffee exports, which totaled \$23,000,000 and \$12,500,000, respectively. The decreased cotton production is reflected in the exports, which declined from \$172,744 in 1926 to \$17,575 in 1927. Sugar exports amounted to \$994,016 in 1927, as against \$763,375 in 1926, an increase of \$230,641, or 23 per cent. Henequen exports during 1927 amounted to \$144,143, as against \$54,562 in 1926. Exports of balsam amounted to \$111,226 in 1927, as against \$119,531 in 1926. Other products of comparatively little importance as exports are indigo, hides and skins, straw hats, honey, and hardwoods, the total export value of which amounted to approximately \$50,000 during 1927. Total exports from Salvador to the United States during 1927 amounted to \$1,564,859, as compared with \$4,561,531 for 1926, a decrease of \$2,996,672. This decline is attributable almost entirely to the small coffee purchases, which amounted to \$1,014,392 in 1927, as against \$3,885,517 in 1926.

Total imports into Salvador amounted to \$14,785,000 in 1927, as compared with \$26,035,000 in 1926, a decrease of 43 per cent. Imports from the United States decreased 56 per cent; from Germany, 38 per cent; from France, 41 per cent; and those from Great Britain increased 6 per cent. The leading imports are cotton manufactures, machinery, hardware, foodstuffs, and pharmaceutical supplies.

FINANCE. Revenues and expenditures of Salvador during 1927 amounted to 20,514,492 and 21,799,527 colones, respectively—a deficit of 1,285,035 colones for the year—according to the President's message to the National Assembly. These totals compare with receipts and expenditures during 1926 of 22,314,798 and 21,922,930 colones, respectively, resulting in a surplus of 391,868 colones. The budget law for 1928-29 as passed by the National Assembly in 1928 provided for receipts of 23,132,000 colones and expenditures of 23,202,486 colones. Of the receipts, the export and import taxes were expected to provide 13,996,000 colones and internal revenue and taxes, 9,136,000 colones. The largest item of expenditure was service on the public debt which amounted to 7,000,000 colones.

COMMUNICATIONS. There are three railway companies operating in the country. The principal line, the International Railways of Central America, operates over a total of 441 kilometers, from the port of La Union, on Fonseca Bay, to the capital, San Salvador; thence northwest to the Guatemalan frontier, where it will eventually connect with the Guatemalan section of the line to Puerto Barrios (see GUATEMALA). The Salvador Railway Co. has a line extending from San Salvador to the port of Acajutla in the western part of the Republic and a branch to Santa Ana from Sitio del Nino, a total distance of 152 kilometers. The San Salvador and Santa Tecla Railway operates 60 kilometers between the cities named. In 1926, 658 steamers entered at the ports of the Republic, with a tonnage of 1,405,000.

GOVERNMENT. Under the constitution, executive power is vested in the President elected for four years, who acts through a ministry of four members; and legislative power in the Congress of

42 members elected for one year by universal suffrage. President in 1928, Dr. Pio Romero Bosque (1927-31); Vice President, Gustavo Vides.

SALVATION ARMY. An international organization with headquarters in London, whose sole purpose is the "salvation of mankind from all forms of spiritual, moral, and temporal distress." The movement was first organized as a mission in the East End of London in 1865 by William Booth, a minister of the English "New Connection Methodists." It spread rapidly throughout England and in 1880, as the Salvation Army, was extended to the United States. Incorporation took place in New York in 1899.

The organization of its government is military in character, and in 1928 it was under the command of General Bramwell Booth, eldest son of the founder, with the international headquarters in London. The higher command is divided into territories, each territory generally being a separate country or colony, with its own organization under the direction of a commissioner, each local corps or post being under the command of a captain and a lieutenant. The United States is divided into four territories, with headquarters in New York, Chicago, San Francisco, and Atlanta, the last named having been organized during 1926.

Internationally, the outstanding events of the Salvation Army during 1928 were the stone-laying ceremony of the International Training College for officers located in Denmark Hall, South London; (when completed it will have cost \$5,000,000); better provision for the care of 30,000 war graves in Europe supervised by Salvation Army officers; the unveiling of the Mile End Memorial, London, to the founder, William Booth; the opening of Dutch Guiana; the relief expenditures for, and of the suffering in, Telegu, India; and the Thames flood.

In the United States, 85 new buildings were added during the year 1928; a new Training College for the Western territory was opened by Commander Evangeline Booth at San Francisco; and a turning-of-the-sod ceremony performed by her at 120 West 14th Street, New York City,—the old national headquarters—where were being erected new administrative buildings with a large auditorium and a home-like residence for 400 business girls, at an aggregate cost of \$2,500,000. The most significant event, however, was the departure of Commander Evangeline Booth, with six other delegates, to attend the first high council held in the history of the Army in London, England. Sixty-four territorial leaders from all parts of the world convened for the purpose of electing a new general consequent upon the alleged unfitness of General Bramwell Booth through failing health to continue the performance of his duties.

In 1928 there were in the services of the Salvation Army, throughout the world, 26,000 officers and cadets; 10,000 persons without rank wholly employed; 152,958 local officers and bandsmen; 62,265 songsters; 35,109 corps cadets; and 16,518 corps and outposts in operation. The Salvation Army conducted 1630 social institutions and agencies; 1816 day schools; and 31 naval and military homes. Other institutions included 149 hotels for men, and 53 hotels for women, accommodating 35,433 persons; five inebriates' homes with 199 patients; 100 homes housing 5080 children; 10 crèches; 24 industrial schools with 1570 pupils; 112 women's industrial

homes, accommodating 3622 women; and 79 maternity homes with 2801 patients. The Army also maintained 309 similar institutions as well as 12 farms; 176 slum posts; 210 homes, elevators, workshops, and woodyards, accommodating 7341 persons. In addition to 17 separate food depots, there were 123 combined shelters and food depots for men, and 18 for women. Through the 140 labor bureaus, 456,668 men were supplied with work. The organization published 123 periodicals, with an average circulation of 2,100,000 copies per issue. The Salvation Army is active in 86 countries and colonies, and its gospel is preached in 70 languages.

The national headquarters of the Army is at 122 West 14th Street, New York, and Commander Evangeline Booth, daughter of the founder, General William Booth, is the national leader. The American territorial commissioners for 1928 were: Richard E. Holz (Eastern), John McMillan (Central), Adam Gifford (Western), and William McIntyre (Southern).

SAMARIA. See **ARCHAEOLOGY.**

SAMOA. A group of 14 islands in the Pacific Ocean, between 13° and 15° S. latitude and 168° and 173° W. longitude, about 2000 miles south of Hawaii and 4000 miles southwest of San Francisco. Since Feb. 13, 1900, the islands east of 171° W. longitude have belonged to the United States; and the islands west of that line belonged to Germany until the outbreak of the War in 1914, when they were occupied by the British and later turned over to New Zealand for administration, under a mandate of the League of Nations.

The official name applied to the former German Samoan Islands is Western Samoa. This territory includes Savaii and Upolu, two of the largest islands, and Apolima and Manono. Area of Savaii, about 660 square miles; Upolu, 550 to 600 square miles. The principal port is Apia, on the island of Upolu. Population, Dec. 31, 1926, 41,660, of whom 2555 were Europeans and half-castes, and 947 coolie laborers. About 11,400 pupils are instructed in schools conducted by the Government and various missionary groups. The products include copra (the chief product), cacao, rubber, sugar, and cardamoms. The imports for 1926 were valued at \$324,940; exports \$320,785. The principal source of imports was Australia and the chief destination of exports was Great Britain. In the same year 84 vessels of 93,441 tons entered and cleared at the port of Apia. The revenue collected for the year ended Mar. 31, 1927, was £133,813; expenditure, £141,710. The general control of the islands is under the New Zealand ministry, and the local government is under an administrator. Administrator in 1928, Maj. Gen. Sir George Richardson.

Tutuila, Tau, and the Manua group comprise the American Samoan group of islands. The total area of the islands is about 60 square miles; and the population, according to the census of 1926, is 8763. The principal port is Pago-Pago, at the extreme end of the bay of the same name on the island of Tutuila, the best and safest harbor in the South Seas. The soil is very fertile. There is an abundance of copra, which is the only article exported, and a variety of fruits, including oranges, limes, bananas, mangoes, and alligator pears. The United States Navy has established a high-powered radio station on the island of Tutuila, which is in daily communication with the islands of the Pacific and the United States. The Government is in the hands of the Governor of

the United States Naval Station at Pago-Pago. The islands are divided into three general administrative districts, corresponding to the former political divisions of Samoa, each administered by a native governor who is appointed by the governor of all the islands. At the head of each village is a chief, elected annually, subject to the governor's approval. Governor in 1928, Capt. E. S. Kellogg, U. S. N.

During the year there were published various accounts of general unrest in the Samoan Islands under the mandate of New Zealand. For years there had been agitation in the islands under the leadership of the Samoan League, called the Mau, which resented the slight participation of the native chiefs in the administration of affairs. Other sources of complaint were the enforcement of liquor prohibition and the regulation of the copra trade. Needless to say, the New Zealand authorities declared that all rules and regulations were carried out for the benefit of the natives. Native opposition took the form of armed meetings and boycotting of New Zealand officials and citizens in general. The situation became so serious that in February the New Zealand Government dispatched warships to the islands and arrested Tamasese, the King of the natives. His arrest which did not take place until November, and which was followed up by deportation and jail sentence in New Zealand, appeared to have successfully broken the back of the Mau movement, inasmuch as no other chief appeared willing to take his place and face the threat of arrest and deportation.

SAMOS. An island in the Aegean Sea, belonging to Greece. Area, about 181 square miles; population, according to the census of 1920 and that of the refugees made in 1923, 80,194. Capital, Vathy, with a population of 12,472. The island was acquired from Turkey as a result of the Balkan War of 1912-13.

SAN MARINO, mā-rē'nō. A republic of Europe, located in the peninsula of Italy. Area, 38 square miles; population, in December, 1925, 12,952. The chief exports are wine, cattle, and the building stone quarried on Mount Titano. The revenue and expenditure for 1926-27 balanced at 4,145,179 lire. There is no public debt. Politically and economically San Marino is closely allied with Italy.

SANTO DOMINGO. See **DOMINICAN REPUBLIC.**

SÃO THOMÉ, soun tō-mā', AND PRINCIPE, prēny thē-pā. Two islands in the Gulf of Guinea, about 125 miles from the coast of Africa, and belonging to Portugal. Area, 360 square miles; population, according to latest available statistics, 52,150 for São Thomé and 6905 for Principe. The islands are hilly, with volcanic soil, but the land is fertile and the products are varied. Cacao, cinchona, coffee, and rubber are the chief exports. The revenue and expenditure for 1926-27 balanced at 10,573,347 escudos. Imports for 1927 were 36,271,746 escudos, and exports 91,776,486 escudos.

SAP MOVEMENT IN TREES. See **BOTANY.**

SARAWAK, sā-ril'wāk. An independent state, comprising the northwestern part of the island of Borneo, under the protection of Great Britain. Area, about 42,000 square miles (coast line 400 miles). Population estimated at about 600,000, made up of Malays, Dyaks, Kayans, other Polynesian tribes, Chinese, etc. Kuching is the capital, with a population of about 25,000. There are large resources of coal, and recently an oil field has been opened up in the Baram region. The chief exports are petroleum products, plantation rubber, and sago flour. The administration of the region was acquired by Sir James Brooke in 1842 from the Sultan of Brunei; it was governed by him under British protection. On his death in 1917 he was succeeded by his son, Sir Charles Vyner Brooke, who is the present rajah. British supervision is exercised by the British agent for Sarawak and British North Borneo.

SARWAT, ABDEL KHALEK PASHA. Egyptian statesman, died at Paris, September 22. He was born at Cairo, Egypt, 1873. He distinguished himself at the study of law, receiving a number of important appointments shortly after the completion of his course. He was made Governor of Assiut, an influential province of Lower Egypt, in 1908, being given the grade of Pasha at the same time. He was appointed Procureur-General of the native courts the following year, a position previously held by Europeans. When the British protectorate was established in 1914 the Prime Minister of Egypt, Rushdi Pasha, made him Minister of Justice, and both men, being nationalists, resigned in 1919 when they could not negotiate with Great Britain for Egyptian independence. Sarwat was appointed Minister of the Interior in Adly Pasha's cabinet two years later, taking the Prime Minister's place while he was treating unsuccessfully with Lord Curzon in England. Adly resigned at the end of the year, leaving Sarwat and Sidky Pasha to manage a disrupted government. With the aid of Lord Allenby, Sarwat secured the Declaration of 1922, whereby the British Government recognized the sovereignty of Egypt. Sarwat was made Prime Minister, Mar. 21, 1922, but his office was hampered by Zaghlul Pasha, who opposed various reservations embodied in the British Declaration. Sarwat resigned in November, after a disagreement with King Fuad, who had attempted to overstep his new constitutional powers. Adly, having again become Prime Minister by June 1926, appointed Sarwat Minister for Foreign Affairs, giving place to him in April, 1927, when the Wafdist opposition forced him to resign his position at the head of the Government. Sarwat and Zaghlul had become reconciled, and the new administration was firmly national. Negotiations for an alliance with England were interrupted by the death of Zaghlul, and when they were completed, Mar. 1, 1928, the Wafds refused to ratify the treaty, believing that it did not sufficiently guarantee Egyptian independence, mainly because it allowed the continuation of British military occupation for ten years, when the question should be submitted to the League of Nations. Sarwat resigned March 4, and was succeeded by Nahas Pasha.

SASKATCHEWAN. A prairie province of Canada, situated between Alberta on the west and Manitoba on the east, extending northward from Montana and North Dakota to the Northwest Territories. Area, 251,700 square miles; population, according to the census of 1926, 821,-

042, a gain of 63,532 over 1921. Capital, Regina, with a population in 1926, of 37,329. Other cities are Saskatoon, 31,234, a gain of 25 per cent over 1921; Moosejaw, 19,039; Prince Albert, 7873. Of the total population in 1921, 538,552 were living in rural communities. In 1926 there were 189,034 pupils and 7494 teachers in the 4721 public elementary schools, and 17,526 pupils in the secondary schools. The total area under cultivation in 1926 was 20,419,175 acres, and the value of agricultural products was \$320,922,000. The acreage and estimated yield of the principal crops in 1927 was as follows: Wheat, 12,979,279 acres, 208,966,000 bushels; oats, 4,412,556 acres, 144,732,000 bushels; barley, 925,889 acres, 26,295,000 bushels; rye, 358,215 acres, 7,905,000 bushels; flax, 330,675 acres, 3,208,000 bushels; mixed grains, 31,000 acres, 968,000 bushels; other grains, 2623 acres, 39,000 bushels; potatoes, 44,823 acres, 3,030,000 cwt.; roots, 3387 acres, 295,000 cwt.; hay and clover, 407,328 acres, 570,000 tons; fodder corn, 33,073 acres, 96,000 tons. Total exports in 1925-26 amounted to \$10,169,324; total imports \$14,898,870. In 1926 there were 7237 miles of steam railway in operation. The government is under a lieutenant-governor appointed by the Governor-General of the Dominion of Canada, and a legislative assembly of 63 members elected for five years by universal suffrage. Women not only have the right to vote but are eligible for seats in the legislature. Lieutenant-governor, H. W. Newlands; premier and treasurer, J. C. Gardiner; Railways, G. Spence; Education, S. J. Latta; Agriculture, C. M. Hamilton; Attorney-General, T. C. Davis; Public Works and Health, J. M. Uhrich; Highways and Telephones, W. J. Patterson; Secretary, Municipal Affairs, Labor and Industries, T. C. Davis.

SAULT STE. MARIE, CANALS AT. In 1928, the 19,286 vessels passing through the United States and the Canadian canals at Sault Ste. Marie, Michigan and Ontario, had a total registered tonnage of 66,835,763, as compared with 18,759 vessels of 64,325,362 tonnage in 1927. The average daily tonnage passing the canals during 1928 was 378,230 tons. The largest single cargo carried was 16,650 tons, which was also the maximum single cargo on record. The number of individual registered vessels using the canal during the 1928 season was 739, which, with the total number of passages at 18,286, made an average of 84 vessels per day.

Through the United States canal, there were 15,928 vessel passages with a registered tonnage of 62,251,697, and through the Canadian canal, 3358 vessel passages with a registered tonnage of 4,584,066. The number of passengers through the canals showed an increase over 1927, the totals for 1927 and 1928 being 55,115 and 56,053, respectively. The total freight passing through the canals aggregated 86,992,997 short tons, or an increase of 3,638,933 tons. Of the total freight tonnage, 70,165,901 tons were east-bound and 16,827,096 were west-bound. The leading items of east-bound freight carried through the United States canal were iron ore, 53,191,726 short tons; wheat 389,368,486 bushels; grain, other than wheat, 115,461,882 bushels, which together with the tonnage carried through the Canadian canal, brought the totals up to 53,225,102 tons, 406,759,712 bushels, and 131,039,303 bushels, respectively, all of which were in excess of 1927 totals for these items carried through the canals. The east-bound lumber car-

ried through the United States canal amounted to 171,568 M. feet B. M.; that through the Canadian canal to 15,637, bringing the total up to 187,205 M. feet B. M.; 4,864,808 barrels of flour were carried through the United States canal, and 4,418,130 through the Canadian canal, bringing the total up to 9,282,938 barrels. Among the leading articles of west-bound traffic was soft coal, 14,043,589 short tons, a decrease over the previous year, when the total was 15,953,959 short tons. Of the 1928 total, 14,017,648 tons were carried through the United States canal and 25,941 tons through the Canadian canal. The total tonnage of hard coal was 826,318, of which 778,785 tons went through the United States, and 47,533 tons through the Canadian canal. These items were followed by 731,674 short tons of general merchandise, of which 360,252 tons were carried via the United States canal and 371,422 tons via the Canadian canal; stone, 561,325 short tons, divided between the American and Canadian canals as follows: 557,945 and 3380 short tons, respectively; and oil, 321,098 short tons, most of which was carried via the United States canal. The United States canal was in commission 227 days and the Canadian canal, 230 days.

SAVINGS BANKS. See **BANKS AND BANKING.**

SAXONY. The name Saxony is applied to three divisions of the former German Empire; the Republic of Saxony (formerly the Kingdom of Saxony); the former Grand Duchy of Saxony (now a part of Thuringia); and the Province of Saxony in Prussia.

REPUBLIC OF SAXONY. The third largest State of the German Republic: proclaimed a republic on Nov. 9, 1918. Area, 5787 square miles; population, according to the census of 1925, 4,992,320. The capital, Dresden, had a population in 1925 of 619,157. The largest city is Leipzig, with a population of 679,159. The other cities with over 100,000 in 1925 were Chemnitz, 333,851, and Plauen, 111,436. In 1926 the movement of population was: Births, 88,381; deaths, 52,856; marriages, 38,772. On May 1, 1927, there were 2129 public elementary schools with 15,800 teachers and 507,234 pupils. In proportion to its size, Saxony is the leading State in German industry, and rivals the chief industrial provinces of Prussia. In 1925 the area under cultivation was 2,373,218 acres. The area under the principal crops with their yields in metric tons in 1927 was: Wheat, 209,926 acres, 215,758 tons; rye, 433,927 acres, 364,699 tons; barley, 77,988 acres, 76,958 tons; oats, 392,050 acres, 385,452 tons; potatoes, 264,584 acres, 1,878,520 tons; meadow, 448,299 acres, 922,799 tons of hay. The livestock census taken at the end of the same year showed 168,769 horses, 693,097 cattle, 705,405 pigs, 200,635 goats, and 71,563 sheep. The chief industry is textile manufacturing, but mining and metal-working are also of importance. In 1926, 4,147,160 tons of coal and 10,053,534 tons of lignite were produced, the combined value being 107,068,000 gold marks. The ordinary budget for 1927-28 balanced at £18,653,914 and the extraordinary budget at £2,514,456. The constitution of the Republic is dated Oct. 26, 1920. The Diet was elected on Oct. 31, 1926, and is composed of the following parties: German Social Democratic party, 31; Saxon Social Democrats, 4; Democrats, 5; German National party, 14; People's party, 12; Communists, 14; Middle Class party, 10; others, 6. Prime Minister in 1928,

appointed in February, 1924, reelected Jan. 11, 1927), Herr Heldt, of the Socialist party.

SCANDINAVIAN LANGUAGES AND LITERATURES. See **PHILOLOGY, MODERN.**

SCANDINAVIAN LITERATURE. This review includes the late books of 1927 in addition to the books of 1928, and is divided into the Danish, Norwegian, and Swedish literature.

DANISH. *Drama.* *Skenk mig Fjender* (Give Me Enemies), by Johannes Buchholtz is the story of a man, who, unwilling to enjoy happiness without fighting for it, challenges Fate to send him enemies. In *De uridende* (The Ignorant), Max Lobdanz deals with an Ibsenian problem, the conflict between science and conscience. Two plays go back to the time of Christ—Kai Munck's *En Idealist* (An Idealist), which treats Herod's life and death somewhat in the manner of Hebbel, and Einar Christiansen's *De spurgte ham* (They Asked Him), which has a broad world historic background and makes us feel the new world spirit manifesting itself at the coming of Christ. Johannes Heskjær's *Dr. Hansen*, like his *Kristine* of last year, shows strong dramatic power.

Poetry. Marinus Børup's *Regnbuen* (The Rainbow) which is largely love poems, strikes a note of genuineness and real sentiment. Other collections worthy of notice are Hans Hartvig Seedorf-Pedersen's *I Dagningen* (At Dawn), in which the lyric poems are the best, and Jeppe Aakjær's *Aftenstjernen* (The Evening Star).

Fiction. Sophus Clausen's *Fortællingen om Rosen* (The Story of the Rose) is of interest not so much for its action as for the discussions concerning art and literature that it contains. The scene is laid in Paris, and the story is permeated with the atmosphere of the Latin quarter. Otto Rung's three volumes of short stories, *Tyre og Røvere* (Thieves and Robbers), *Retters Sværd* (The Sword of Justice), and *Livet farligt* (Dangerous life) all show interest in the exceptional and extraordinary.

Memoirs and Literature. In *Erindringer* (Reminiscences) Harald Høffding gives an interesting account of his experiences as a professor of philosophy and of the development of his works. Svend Leopold's *Erindringer fra min Ungdom* (Reminiscences from My Youth) is of special interest because of the literary characters described in it. Nils Hoffmeyer gives a good picture of the Eternal City and its Scandinavian visitors in *Romereske Dage* (Days in Rome). In *Danmarks fornviser* (Denmark's Old Folk Songs) Ernst von der Recke endeavors to discover the original forms of the old *viser*.

NORWEGIAN. *Theatre.* In view of the centenary of Ibsen's birth, several of his plays were produced in the theatres of Oslo.

Poetry. Some of the poems of Olaf Bull's *Metope* are among the best ever written in the Norwegian language. Although Nils Collett Vogt's *Vind og bølge* (Breeze and Billow) gives expression to widely varying moods, it shows in general a more sombre outlook on life than his earlier poems. *Berget det blaa* (Blue Mountain) comes nearer to artistic perfection than any of the other works of Arnulf Øverland.

Fiction. In *Skibe i drift* (Drifting Ships) Kristian Elster shows a pessimistic view of the official and wealthy classes. Katharina Gjesdahl's

Toves mand (Tove's Husband) is the story of a mésalliance. In *Hyrden* (The Shepherd), a sequel of *Svend Morgendug*, Gabriel Scott attempts to solve the problem of divine justice. *Syndere i sommersol* (Sinners in the Summer's Sun), by Sigurd Hoel gives the story of an interesting but unsuccessful experiment. A group of young people go to the sea shore for a vacation and agree not to be drawn into the ordinary love affairs with the accompanying jealousies and quarrels. Sigrid Undset, who received the Nobel Prize for literature this year, added another section to the story of Audunssøn, *Olav Audunssøn og hans børn* (Olav Audunssøn and his Children). Like so many of Undset's heroes, Olav struggles constantly to find peace within himself. O. E. Rölvaag's *Peder Seier* (Peder Victorious), a sequel to *Riket grundlægges*, deals with the second generation of Norwegians in America. Like Rölvaag's earlier books it was received with enthusiasm.

Literature, etc. In his *Henrik Ibsen*, Halvdan Koht stresses the fact that Ibsen was above all not a philosopher nor a thinker but a poet. *Tegn og gjærninger* (Signs and Deeds) by Ronald Fangen is a collection of interesting essays dealing with different subjects such as political theory, literature, evolution, etc.

SWEDISH. *Poetry.* *Slöjan* (The Veil) has a simpler style than the earlier poems of Bertil Malmberg and a more direct human appeal. Artur Lundqvist made his début with *Glöd* (Glowing Embers), a collection of free verse, highly expressionistic. Two collections by Swedish poets in Finland deserve mention: Hjalmar Procopé's posthumous volume *Eget och andras* (My Own and Others'), and Barbro Mörne's *Bild och syn* (Image and Vision), which received a prize given by the Finnish Government. Other volumes worthy of mention are Sigurd Elmblad's *Dröm och längtan* (Dream and Yearning), and Ragnar Jändel's *Kämpande tro* (Struggling Faith).

Fiction. In *Förbrytare* (Criminals) Rudolf Värnlund undertakes to show how difficult it is to judge men, to unravel the multitude of purposes and motives which influence their actions, to distinguish the criminals from the non-criminals. He does this without preaching and in a fascinating manner. The last chapter is a masterpiece. The greater part of Sigfrid Siwertz's *Jonas och Draken* (Jonas and the Dragon) takes place during the Great War. It gives an excellent picture of the feverish unrest which during that period pervaded even the neutral countries of Europe. Through his hero, the author makes us feel closely acquainted with two widely different spheres, the university circle and the newspaper world. *Lotten Brenners ferier* (Lotten Brenner's Vacation), which, like many of Hjalmar Bergman's stories, is extraordinary and fantastic, shows the change effected in a scholarly and unemotional woman—a Ph.D. and university lecturer—by the exchange of the lecture room for the sea shore. In *Den kloka Elsa* (The Wise Elsa), Anna Lenah Elgström depicts in a touching and sympathetic manner the emotions and the experiences of a growing girl. Eyvind Johnson's *Minnas* (Remembering) shows in a convincing and realistic way the hold that thought and memory have on human life. With her usual faithful portrayal of a cross-section of Värmland life, Selma Lagerlöf added another chapter to the history of the Löwensköld family in *Anna Svärd*. Among collections of short stories may be

mentioned Gertrud Lilja's *Människor* (Human Beings), and Elin Wägner's *Den odödliga gärningen* (Immortal Deed).

Miscellaneous. In *Fantasier* (Imagination), Olle Holmberg discusses dreams and day dreams and their relation to poetry. Einar Tegen wrote a collection of essays, *I filosofiska frågor* (Problems of Philosophy).

SCARLET FEVER. THE SERUM TREATMENT. The status of this subject did not change materially during the year 1928. The literature had become very large and reports published seemed favorable. The theory rather than the practice of the serum treatment was under criticism, for there was still denial that the hemolytic streptococcus was the true cause of the disease and that the antitoxin was a true antidote. At last accounts it had been found that the hoped for results from the diagnostic skin test followed by preventive inoculation had not materialized, but whether this was a temporary setback or a permanent failure did not appear. Startling therapeutic results are occasionally seen in the infectious febrile diseases from injections of non-specific protein substances of various kinds, so that it becomes more and more difficult to fix the status of specific serum therapy.

PREVENTION OF KIDNEY COMPLICATIONS. An important advance in our knowledge of this disease which is apparently quite unrelated to the revolutionary discoveries of the past few years was announced by Dr. A. A. Osman of Guy's Hospital, London. Certain tests, the character of which was not indicated, foretell the development of kidney complications and make it possible to administer preventives in the shape of simple alkaline compounds. While the normal frequency of these complications has been 5.5 per cent, under the new procedure this figure was reduced to less than 1 per cent, in a group of 620 patients.

Professor U. Friedemann of the Department of Infectious Diseases of the Rudolf Virchow Hospital, Berlin, contributed an exhaustive article on the question, Is the Dick Conception of Scarlet Fever Erroneous? which appeared serially in the *Klinische Wochenschrift*, closing in the issue of Dec. 2, 1928. The entire controversial material is analyzed and while the conclusions do not militate against the practical value of the Dick conception, the theory does not well accord with it. According to Friedemann the evidence weighed points to the non-specific character of the toxin obtained from the so-called streptococcus of scarlatina. There are numerous varieties of pathogenic streptococci which cause such dissimilar conditions as erysipelas, puerperal fever, septic sore throat, and local suppurations in addition to scarlet fever. Any of these may at times form a toxin, but rather as a casual by-product than an inevitable result and any of these toxins may be neutralized by the antitoxin of scarlet fever. The Dick doctrine was at first so well built up that it seemed impregnable and only the slow cumulation of data from many quarters has made it possible to question its soundness. It is of interest to note that Professor Friedemann is a believer in the clinical efficacy of the serum which certainly appears to act on the disease in a specific fashion (see articles in *Deutsche medizinische Wochenschrift*, 1928, vol. liv, pp. 813 and 863).

Some leading authorities were regarding scarlet

fever as consisting originally of a local streptococcal infection of the tonsils with later absorption of the bacterial toxins into the blood. If this hypothesis be correct, then removal of the tonsils might prevent infection or diminish greatly the risk. It occurred to two young physicians of Frankfurt am Main, Berberich and Jordanoff, to investigate the subject of the incidence of the disease in the tonsillectomized. In 362 of the latter, including both children and older subjects only 12 developed the fever after the operation had been performed and in three of these the infection at once followed the operation (so-called surgical infection). It was possible to examine the other nine patients who contracted the disease and it appeared that the removal of the organs had been incomplete. The authors published only a preliminary communication, in the *Deutsche medizinische Wochenschrift* for December 7, but one of them (Jordanoff) was to prepare a monograph on the subject.

SCHEER, ADMIRAL KARL FRIEDRICH REINHARD VON. Commander of the German fleet at the battle of Jutland, died at Marktredwitz, Bavaria, November 26. Born at Obernkirchen, Sept. 30, 1863; he entered the Royal Navy and served on the *Hertha*, 1880-82, on the *Bismarck*, 1884-86, on the *Sophie*, 1888-90, on the *Prinzess Wilhelm*, 1895-96, and later on the *Niobe*. He commanded torpedo boats, 1901-02, and was stationed on the battleship, *Elsass*, 1907-09, being made head of the high seas fleet in the latter year. Admiral Scheer was department director of the Navy in 1912. At the opening of the World War, in 1914, he was chief of the second battle squadron, and in 1915 was put in command of the third squadron. Being promoted to the head of the high seas fleet, Jan. 15, 1916, he was in command of the German Navy during the great battle with the British Navy off the coast of Jutland, May 31, 1916, when each side claimed the victory. After the battle Admiral Scheer succeeded Henning von Holtzendorff as chief of the admiralty staff, retiring Dec. 8, 1918. After the War, Admiral Scheer took part in politics as a moderate member of the Nationalist party.

SCHELER, MAX FERDINAND. German philosopher and educator and writer of books on philosophy and ethics, died at Frankfurt am Main, Germany, May 21. He was born at Munich, Germany, Aug. 22, 1874. He was educated at the gymnasium at Munich, and at the universities of Munich, Berlin, Heidelberg, and Jena, and became a docent in philosophy at Jena in 1902. He was in Switzerland in 1917 and in Holland in 1918 in the service of the German Foreign Office. In 1919 he was director of the research institution at Cologne. Later, and until his death, he was professor of philosophy and sociology at the University of Cologne and director of the sociological research institute at the same city. He published many works on philosophy, ethics, and similar subjects, two of the best known being *Problems of Knowledge* and *On the Sociology of Knowledge*.

SCHLAPP, MAX GUSTAV. American neurologist and criminologist, died at New York, March 5. He was born at Fort Madison, Iowa, Nov. 4, 1869. He studied at Cornell University, 1891-93, and then at the Bellevue Medical School at New York City. He studied for six years in Germany and obtained his medical degree at the University of Berlin. He returned to America in 1900,

and as a specialist in mental and nervous diseases became assistant professor of neuropathology at the medical school of Cornell University, New York City. He held that chair until 1914, and from that time until his death he was professor of neuropathology at the Post-Graduate Medical School, New York. In 1914 he was appointed a member of the New York State commission to investigate provisions for the mentally deficient. Dr. Schlapp was deeply interested in delinquent children and criminals and set afoot several movements for the amelioration of their condition. He was a member of the American Medico-Psychological Association, the New York Academy of Medicine, and the New York Neurological Society. He lectured and wrote extensively, and besides numerous papers relating to neurology, etc., wrote the following: *Causes of Defective Children*; *Behavior and Gland Disease*; *Mongolism, a Chemical Phenomenon*; *A Plan for the Reduction of Criminality*. He was also co-author of a book, *The New Criminal*, in preparation at the time of his death.

SCHMIDT, ETTORE. See SVEVO, ITALO.

SCHMITT, CHRISTIAN. Alsatian author and secretary of the library of Baden, at Karlsruhe, died April 28. He was born at Geudertheim, near Brumath, Mar. 28, 1865, and after attending preparatory schools, he studied at Strassburg. He first served as secretary of the Kaiser Wilhelm University, and of the library of Strassburg, and in 1920 received a similar position at the Baden library, which he held until his death. Besides arranging for the song book, *Erwinia* (1893-1902), he wrote both prose and poetry, publishing the following books: *Alsallieder* (reissued, 1901); *Die Weihnachtsboten, ein Züricher Prolog* (1902); and *Aus Höhen und Tiefen* (1906).

SCHMITZ, EUGENE F. American politician and musician, died at his birthplace, San Francisco, Calif., November 20. Born Aug. 22, 1864, he became an orchestra leader at the Columbia Theatre, San Francisco. Abraham Ruef, political leader of the Union Labor party, selected him as a candidate for mayor, and in 1900 secured his election. Schmitz was reelected in 1903, in spite of the rumor that he had sold privileges through his promoter. Democrats and Republicans combined against him in 1905, but Schmitz won the election. Opposition ceased temporarily after the earthquake of April 18, 1906, and all parties praised the mayor for his efficient, non-partisan organization of relief committees. When the rehabilitation work was done, the charges of corruption and graft were renewed, and Schmitz returned from a vacation trip in Europe in 1907 to answer more than forty indictments for extortion, mostly in connection with the trolley franchise. Schmitz, Ruef, and several others were found guilty and, on June 13, the mayor was sentenced to five years in the State penitentiary, for charging arbitrary license fees to restaurant proprietors. The case was appealed and, on Jan. 9, 1908, the Appellate Court set aside the verdict of the lower court, on the technical point that the indictment against Schmitz did not charge him with making threats of unlawful injury. Being released, Schmitz returned to the orchestra. He ran again for mayor in 1915, polling almost one third of the votes. He was elected to the Board of Supervisors in 1917 and again in 1921, but after being defeated in 1925, he retired definitely to private life. Schmitz composed an operetta,

The Maid of San Joaquin, which was produced unsuccessfully in New York.

SCHNEIDER, shnī'dēr, ALBERT. American scientist, died suddenly at Portland, Oreg., October 27. Born at Granville, Ill., Apr. 13, 1863, he was graduated from the College of Physicians and Surgeons, Chicago, in 1887, and in 1894 he received the B.S. degree from the University of Illinois, and the M.S. degree from the University of Minnesota, where he had become instructor in botany the previous year. After receiving the degree of Ph.D. from Columbia in 1897, he was appointed professor of pharmacognosy and bacteriology at the Northwestern University School of Pharmacy, Chicago. He held a similar professorship at the University of California in 1903, also teaching materia-medica and therapeutics, 1904-06. In addition to his educational work, he served as director of the experiment station of the Spreckels Sugar Company, 1906-07, as pharmacognosist of the U. S. Department of Agriculture, 1909-15, and as micro-analyst of the California State Food and Drug Laboratory, 1915-19. Dr. Schneider resigned from the University of California in 1919, to accept the professorship of pharmacognosy at the College of Pharmacy of the University of Nebraska. He returned to the coast after two years, and became Dean of the School of Pharmacy of the North Pacific College, Portland, Oreg., in 1922, holding that position until his death. Dr. Schneider invented a car ventilating system, and he lectured on crime investigation at the summer sessions of the University of California. Besides contributing numerous papers to scientific journals, he was editor-in-chief of the *Pacific Pharmacist*, 1910-15, and he translated *Westmaier's Compendium der Allgemeinen Botanik*, in 1896, and wrote many books on bacteriology and allied subjects, among the most important of which are *Primary Microscopy and Biology* (1890); *A Text-book of General Lichenology* (1897); *Microscopy and Micro-Technique* (1899); *General Vegetable Pharmacography* (1900); *Medicinal Plants of California* (1909); *Drug Plant Culture in California* (1912); *Bacteriological Methods in Food and Drug Laboratories* (1915); *Pharmaceutical Bacteriology* (1920); and *The Microbiology and Microanalysis of Foods* (1920).

SCHNEIDER, JACQUES. French manufacturer, aviator, sportsman, and donor of the Schneider Cup, an international seaplane trophy, died at Beaulieu-sur-Mer, France, May 1. M. Schneider presented the cup to the Aéro Club of France in 1912 for the purpose of developing marine aircraft through annual competition among the nations. Marcel Prevost won the first Schneider Cup race in 1913 by attaining a speed of about 60 miles per hour. On Sept. 26, 1927, it was won by Lieut. S. N. Webster of England, who flew at the rate of 231.488 miles per hour at Venice, Italy. The Schneider Cup races have been held every year since 1913 with the exception of the War years. In January, 1928, M. Schneider was present at the meeting of the International Aeronautic Federation at Paris and endorsed the plan to hold the race biennially instead of annually.

SCHROEDER, ALWIN. A famous American cellist, died at Jamaica Plain, near Boston,

October 17. Born near Magdeburg, June 15, 1885, he studied piano with his father and J. Andrae, and later violin with De Ahna in Berlin. The cello he studied entirely by himself and made such progress, that in 1875 he was engaged as solo-cellist with Liebig's Orchestra. After filling a similar position in Hamburg, he went to Leipzig, in 1880, as cellist of the Gewandhaus Orchestra, professor at the Conservatory and cellist of the Petri Quartet. In 1891 he came to America as solo-cellist of the Boston Symphony Orchestra, which post he held with signal distinction at various periods (1891-1903, 1910-12, 1918-20). From 1891-1907, he was a member of the celebrated Kneisel Quartet. In the latter year, he went to Frankfort-on-Main as solo-cellist of the Museum Orchestra and professor at Hoch's Conservatory, but returned to Boston the following year. From 1908-10, he was a member of the Hess-Schroeder Quartet, and in 1915 he joined the Margulies Trio, in New York, and the Boston String Quartet. Although a superb virtuoso, he was rarely heard as a soloist, his absorbing passion being chamber music. As an ensemble player, he had no superior and but few equals. He wrote some instructive works for cello.

SCHUBERT, CENTENARY. Franz Schubert, a German vocal and instrumental composer, was born at Lichtenthal, near Vienna, Jan. 31, 1797, and died in Vienna, Nov. 19, 1828. In view of the enormous popularity which this master's works enjoy today, it was not surprising that throughout the civilized world the centenary of his death should be observed by celebrations befitting the occasion. Just as the year 1927 had been a Beethoven year, so 1928 was preëminently a Schubert year. In both cases the celebrations were by no means confined to the actual anniversary day, but extended even beyond the limit of the calendar year. Organizations and individual artists vied with one another to pay homage to the memory of one of the immortals, and it may be asserted without fear of contradiction, that not a single day passed but witnessed the public performance of at least one work of Schubert.

As might have been expected, Vienna, the city where Schubert was born, lived, and died, strained every nerve for the purpose of surpassing in scope and splendor any celebration held elsewhere. In 1912 the city had bought and converted into a Schubert Museum the house at 54 Nussdorfer Strasse, where the master was born. In the centennial year, the house where he died, at 6 Kettenbrücken Gasse, was acquired for a similar purpose. On March 26, the exact anniversary of the only public concert Schubert gave in his life, the Gesellschaft der Musikfreunde repeated the identical programme arranged by Schubert. In August, the gathering of 180,000 singers, participating in a monster Sängerfest, was made the occasion of a two-week Schubert festival, culminating in the world-première of Richard Strauss' *Die Tageszeiten*, produced by the Schubert Band under its regular conductor, Viktor Keldorf. This work, for male chorus and orchestra, on four poems of Eichendorff, was written especially as a contribution to the centennial celebration. Although it cannot be ranked among its composer's greatest achievements, *Die Tageszeiten* rises far above the level of occasional compositions.

But the climax was not reached until the official celebration during the week beginning No-

vember 19, when practically nothing was heard but Schubert's music. The Staatsoper revived three of his operas, *Der häusliche Krieg*, *Die Zwillingbrüder*, and *Rosamunde*, the Gesellschaft der Musikfreunde produced the Mass in Eb, the Rosé and Busch quartets, augmented by assisting artists, almost all the chamber music, and the Philharmonic Society, under Furtwängler, the great symphonies in C and B minor, as well as Atterberg's questionable tribute. Out of the vast number of recitals given by individual artists, there stood forth preëminent the piano recitals by Bachaus and the song recitals by Elisabeth Schumann, Hans Duhan, Alfred Jerger, and Mia Peltenberg.

On the anniversary day itself, there were impressive ceremonies at the grave, the unveiling of a Schubert Fountain in front of the house where the master was born and, at the exact hour of his death (3 P.M.), a concert of appropriate selections from his chamber music and songs in the very room where he died.

Space forbids enumeration of details of celebrations held in practically every city of Germany and Austria, but it should not go unrecorded that in Halle there was given the world-première of Schubert's two-act opera *Die Freunde von Salamanka* (May 6).

While the United States was not behind in honoring the great German master, American enterprise contributed what will remain a lasting monument of the highest artistic merit, the magnificent Schubert Centennial Edition of phonographic records of practically all the recognized masterpieces, issued by the Columbia Phonograph Company in 16 albums of 78 double-faced discs. The same company's \$10,000 prize offered the preceding year (see YEAR BOOK, 1927) for the best symphonic work in the style of Schubert was awarded to a Swedish composer, Kurt Atterberg, for a Symphony in C. The work had several performances in Europe and in the United States, and even was recorded by the Columbia Company. Unfortunately, it was worthy neither of the prize nor the occasion; it was, as one of the judges frankly expressed it, merely "the best of a sorry lot submitted."

SCULPTURE. The general tendency in sculpture, as in painting, was marked by a return to a more conservative and sound technique. An evidence of this was seen in 1927 in an exhibition of the work of Despiau, who was thoroughly academic. No more successful exhibition from the point of view of the interest of the public had been held in New York, and the interest continues. The one group exhibition in 1928, however, showed a decided preponderance of modernistic works, although the honors were divided between Maillol and Despiau. Other sculptors exhibiting in this group were Bourdelle, Dobson, Epstein, Haller, Kolbe, Mestrovic, and Carl Milles, the Swedish sculptor. Very few exhibitions of sculpture alone were held in 1928, and sculpture is too often the weak feature of an exhibition in which it is included.

One of the more interesting exhibitions was that of Gaston Lachaise, an American sculptor who was looked on with a good deal of interest. Other sculptors who exhibited during the past

year were Poupelet, Robert Laurent, and William Zorach. An out-door exhibition of sculpture was arranged in Rittenhouse Square by the Art Alliance of Philadelphia. Eighty-seven works of varied style were shown, of which a wooden statue by Robert Laurent was probably the best. One of the most notable displays was the group of American and French figures by Houdon, arranged in the sculpture rotunda of the Pennsylvania Museum for its opening exhibition. This proved a fitting memorial for the centenary of this well-known eighteenth-century sculptor.

The event of the year in the field of sculpture was the announcement by the National Sculpture Society of a large and representative exhibition of American sculpture to be held in San Francisco in the spring of 1929. Archer M. Huntington's generous gift of \$100,000 made the exhibition possible.

SCURVY. Scurvy in the adult (save in patients who come from tropical and subtropical countries where the disease still prevails) has been regarded as all but extinct in the United States, but evidence accumulates to suggest that in reality it is often overlooked. Thus, Dr. Shattuck of Boston (*Journal of the American Medical Association*, June 9, 1928) saw his first adult case in 1922, but study of the records of the Massachusetts General Hospital showed that adult cases were now and then interned; thus records of 14 cases were found over a period of 37 years. The disease was apparently on the increase, for five cases had been admitted in five years. The records of the Boston City Hospital showed no scurvy in adults before 1923, although 17 had been interned since that period. In other words 22 cases of a disease believed to be extinct have presented themselves in five years with a likelihood that numerous others have been masked under wrong diagnosis. It is of interest to note that the entire 17 patients in the Boston City Hospital lived alone without any feminine or other supervision (all were males), and had low earning capacity as a result of which they were poorly fed. Alcohol did not figure as a factor. It is evident, although the author does not specifically allude to it, that the high cost of food—in conjunction with low earning power and the absence of womanly thrift and economics—is well adapted to cause deficiency diseases of which scurvy is the oldest known.

SEISMOLOGY. According to Jeffreys, seismograms obtained near the epicentres of European quakes indicate the existence of three distinct layers in the earth's crust, viz., a thin sedimentary layer, beneath which is an intermediate basaltic layer 20 kilometers in thickness, followed by a granitic layer 10 kilometers in thickness, these in turn are underlain by an ultrabasic layer reaching halfway to the metallic core of the earth. Mohorovičić, however, maintains that the combined thickness of the intermediate and the granitic layers is 57 kilometers. Jeffreys consider that most quakes, including all large ones, have focal depths in excess of 35 kilometers.

As was shown by Omori, the distance of an earthquake focus from a neighboring station may be obtained from the duration of the preliminary tremors recorded there, and, if the distance of the picture is known, it is a simple matter to determine the depth of focus. Suyehiro has

in this way determined the focal depths of 17 quakes, each with an epicentre less than 100 kilometers from Tokyo, and finds that they fall into two classes, the depths ranging from 25 to 50 kilometers is one class and from 55 to 95 in the other. In the first class, each quake shows several groups of waves, while those of deeper origin have only one or two groups; this suggests that in the upper and more brittle layer, the initial movements start in succession, or in different places, while in the lower stratum a single movement usually takes place throughout the focal region.

Horizontal pendulums specially designed to record tilting of the surface of the earth have been found by Haeno to show two regular variations, one diurnal and the other annual, both agreeing closely with the variations in earth temperature at a depth of 10 centimeters, and also irregular variations which, in some cases at least, occur just before quakes. Imamura has similarly found that abnormal tilting of the land took place before the great quake of Sept. 1, 1923; in particular, a sharp tilting of 0.3" occurred during the eight hours just preceding the quake.

A new type of seismometer, devised by Wenner of the United States Bureau of Standards, in which the shock transmitted by the earth to the instrument is recorded through a galvanometer, was put into operation by the United States Coast and Geodetic Survey. Intensive study of local tremors with improved types of instruments was being continued in southern California, through the coöperation of several organizations.

The regions of California surveyed prior to 1900 were resurveyed by the United States Coast and Geodetic Survey during 1922-1925, in order to determine what earth movements had taken place in the interval, during and following the San Francisco earthquake of 1906. A preliminary report was issued in 1924, but the completion in 1928 of a new readjustment of the triangulation net covering the western United States has led to much more accurate and definite results, which differ considerably from the earlier conclusions. It is found that many stations in the neighborhood of the San Andreas fault, near and to the southward of San Francisco Bay, have moved by appreciable amounts: The trend of the displacements to the east of the fault is southeastward, while that of stations to the west of the fault is northward or northwestward; the largest movements have occurred close to the fault, while stations more than twenty miles from the fault have been affected only slightly if at all. The largest movement found is a relative shift of 14 feet between Ross Mountain and Point Reyes Lighthouse.

Among the workers in this field who died during the year were Emil Wiechert, March 19; and Giulio Gräblivitz, September 19.

An important publication was by H. P. M. Bouasse, *Séismes et sismographes* (Paris). See EARTHQUAKES; PHYSICS.

SELANGOR. See FEDERATED MALAY STATES.

SENEGAL, *sén'egal'*. A colony belonging to France on the west coast of Africa, under the Government of French West Africa (see FRENCH WEST AFRICA). Total area, 74,112 square miles; population in 1926, 1,318,287. Capital, St. Louis, with a population in 1917 of 23,326. Other important towns are Dakar, the seat of the Government-General of West Africa, and a fortified

naval station; population, 1918, 25,468, of whom 2791 were French; and Rufisque, population, 11,414.

The estimated area under cultivation has been placed at 307,000 acres. Cotton is cultivated, and a wild variety is also found. The principal source of wealth consists of peanuts, and the value of the export of this commodity is three times that of all other exports taken together. In 1926, the imports were valued at 909,998,954 francs and the exports at 885,945,699 francs. The local budget for 1926 was 85,801,324 francs. Dakar, Rufisque, and St. Louis are connected by a railway 165 miles in length, and there is another between Thiès and Kayes, a distance of 435 miles. The administration is in the hands of a lieutenant-governor, assisted by a council of 40 members, 20 of whom are elected by the French citizens and 20 by representatives of the native chiefs. The colony sends one Deputy to the French Parliament.

SENFEE COLLECTION. See ART SALES.

SERBIA. A former Balkan kingdom which was proclaimed in December, 1918, a part of the new Unitary State of the Serbs, Croats, and Slovenes. (See JUGO-SLAVIA.) In the new State Serbia is divided into two provinces, North Serbia, with an area of 19,286 square miles and a population, at the census of 1921, of 2,655,078, and South Serbia, with an area of 17,651 square miles and a population of 1,474,560. The former capital of Serbia (Belgrade) became the capital of Jugo-Slavia, and had a population in 1921 of 111,740.

SEWERAGE AND SEWAGE TREATMENT. By far the largest activated-sludge plant in the world, if not the largest plant for treating sewage to a high degree, was put in operation in 1928 by the Chicago Sanitary District. It was designed to treat the sewage, chiefly domestic, to the average amount of 175,000,000 gallons per day, from an area of 78 square miles on which the estimated population for 1930 is 830,000. The works were planned for future doubling of capacity. The site has an area of 97 acres, but this does not provide for treatment of the sludge or solid matter (heavily diluted with water) which will be pumped through a 14-inch cast-iron pipe line 18 miles long for further treatment at the West Side plant of the Sanitary District. The latter plant, construction on which was well advanced at the close of 1928, consists of two-story or Imhoff settling and sludge-digesting tanks, designed to serve a population of 1,850,000. The sludge produced by this and the North Side plant will be dried on open-air beds, then stripped from the beds by machines and dumped on land alongside the Chicago Drainage Canal, an area of 900 acres being available for the purpose. This canal, put in use on Jan. 1, 1900, was designed to dispose of the sewage of the district by dilution, the diluting water being diverted from Lake Michigan southward to the Mississippi River system. Growth of population and other factors had made treatment necessary. The cost of the North Side plant and accessories was about \$19,000,000. The West Side plant was to cost some \$20,000,000. Smaller

plants had been built by the district and others were projected.

The project for a 180,000,000-gal. activated-sludge plant on Ward's Island, in the East River, New York City, to treat the sewage from a million or more people living in the Boroughs of Manhattan and the Bronx, mentioned in the 1927 YEAR BOOK, was advanced near the close of 1928 by the signing of a contract with a firm of consulting engineers for the design of the works. The latest estimates of the cost of these works was \$18,500,000. In addition, intercepting sewers in the two boroughs and tunnels from them beneath the river to the island are estimated to cost \$12,500,000. The contract price for the design of the activated-sludge plant was \$605,000. This includes no allowance for the design of the sewers and tunnels just mentioned, or for supervising the construction of these and the sewage-works, all of which will be done by the engineers of the two boroughs. The contract for the design of the Ward's Island sewage-works provided that the works shall "remove not less than 90 per cent of total suspended matter and not less than 95 per cent of the total bacteria" in the sewage, and that "when in operation [they] shall be free from nuisance due to obnoxious odors, gases, and dusts." The sludge from this plant was to be barged to sea for disposal, except that a plant for converting into fertilizer 50 tons of sludge a day may be built, chiefly for demonstration purposes.

At Milwaukee, Wis., and at a point owned jointly by Pasadena and three other California cities, the excess sludge from activated-sludge plants is dried and otherwise treated and sold for use as a fertilizer. Efforts to the same end had been made by the city of Houston, Texas, at one of its two activated-sludge plants and were being continued, with new apparatus, in 1928.

The instances cited are almost if not quite the only ones out of the scores of activated-sludge plants in the United States, Canada, England, and elsewhere where conversion of the sludge into fertilizer had been attempted, although this was one of the hopeful possibilities of the process when it was introduced 10 or a dozen years previously. The serious physical difficulties met in dewatering the sludge from say 97 to 10 per cent moisture and the capital and operating charges incurred had thus far deterred most engineers and most cities from attempting to convert the excess sludge into fertilizer. Where it had been attempted, no thoroughly satisfactory figures of cost have yet been published. Apparently, the best that can be said, taking into account high operating and capital charges, including depreciation of plant in the latter, is that the revenue from the fertilizer amounts to enough to pay the extra cost of producing it, compared with some other method of getting rid of the sludge. There was much the same uncertainty as to any other method of reclaiming the fertilizing value in sewage that had yet been attempted. Some engineers maintained, however, that the sewage disposal problem has been only partly solved unless the sludge is more thoroughly treated than is commonly done.

Cleveland, Ohio, completed its third sewage-works during the year, known as the Southerly. It was designed to treat sewage from 400,000 people in 1940, and consists of screens, grit chambers, Imhoff tanks, a pumping station, trickling or percolating filters, and humus or

final settling tanks. Glass-covered sludge-drying beds with an area of 94,000 square feet were proposed.

For a summary of an American engineer's notes on European sewage treatment, made during a visit in 1928 to 25 British and German cities, see article by George B. Gascoigne in *Engineering News-Record*, July 19, 1928, p. 91. Consult Metcalf and Eddy, *American Sewerage Practice*, vol. i, *Design of Sewers*—revised edition (New York). Veal, *The Disposal of Sewage*—chiefly from the British viewpoint (London and New York).

SHAFFER, NEWTON MELMAN. American surgeon, died at New York, January 3. He was born at Kinderhook, N. Y., Feb. 14, 1846. After studying at the Free Academy of the City of New York (now the College of the City of New York), and at the Hospital for the Ruptured and Crippled, New York, he entered the University Medical College of New York University and obtained his degree of M.D. in 1867. He was with the hospital, as student, clinical recorder, and assistant resident surgeon before becoming assistant surgeon of the New York Orthopaedic Dispensary and Hospital, in 1872; he later became chief surgeon and remained in the service of that institution until 1898. He was also orthopaedic surgeon at St. Luke's Hospital, 1872-87, and professor of orthopaedic surgery at the University Medical College and Cornell University Medical College. According to writers on medicine he was the first orthopaedic surgeon in America to be known by that title. He was mainly instrumental in the establishment of the New York State Orthopaedic Hospital, and he served as the chief surgeon of that institution for many years. Dr. Shaffer was the chairman of the committee which obtained recognition of orthopaedic surgery as a distinct branch of the profession, at the Tenth International Medical Congress, 1900. He was a member of several medical societies, and wrote *Selected Essays on Orthopaedic Surgery* (1923), besides numerous brochures and articles on his speciality.

SHAKESPEARE, JOHN HOWARD. English clergyman, a leader of the Baptist denomination, died at London, March 12. Born at Malton, England, in 1857, he was educated at University College, London, and at Regent's Park Baptist College, being graduated from the latter institution in 1881 and receiving a master's degree in the following year. From 1883 to 1898 he was minister of St. Mary's Baptist Church, Norwich, England. In the meantime he interested himself in the wider affairs of his denomination, and in 1898 went to London as secretary of the Baptist Union of Great Britain and Ireland, holding that post until 1924. He served as European Secretary of the Baptist World Alliance; president of the National Council of Evangelical Free Churches, 1916; moderator of the Federal Council of the Evangelical Free Churches of England, 1919-21; joint secretary of the Council and chairman of the United Navy, Army, and Air Force Board. Among his outstanding achievements were the establishment of the Baptist World Alliance and raising the Twentieth Century Fund and a fund of £250,000 to secure a living wage for Baptist clergymen. Dr. Shakespeare received the degree of D.D. from Glasgow University, and that of LL.D. from McMaster University, Toronto, Ont. He was a descendant of the grandfather of William Shake-

speare. He wrote: *Baptist and Congregational Pioneers: The Churches at the Cross-Roads.*

SHIPBUILDING. The total output of mercantile shipbuilding throughout the world in 1928 amounted to 2,699,239 tons or an increase of 413,560 tons over the 1927 total of 2,285,679 tons. These statistics, from the annual summary of mercantile shipbuilding of the world compiled by *Lloyd's Register of Shipping*, which does not include warships, take into account merchant vessels of 10 tons gross and upward launched in 1928 irrespective of whether they were completed during the year or were still under construction. Compared with 1913, during which the pre-war world-record output was reached, the 1928 figures showed a decrease of over 600,000 tons.

These figures from the annual summary of *Lloyd's Register of Shipping* may be studied in connection with the statistics from the separate countries and the analysis of type of vessels and machinery included in the output of the year. There were 37 vessels of over 361,000 tons to be fitted with steam turbines, including 11 vessels having a combination of steam and turbines and reciprocating engines. During 1928 there were launched 302 vessels with a tonnage of 1,183,229 tons, fitted with internal combustion engines as against 254 vessels with 863,694 tons launched in 1928. The 1928 output of motor ships was 80 per cent of the world's output of steam tonnage as compared with 62.8 per cent in 1927. At the end of 1928, the motor ships building were 184,000 tons in excess of the steam tonnage being built. The total steam tonnage launched in 1928, amounting to 1,477,092 tons, included some 560,000 tons of steamers fitted for burning oil fuel, so that the tonnage depending exclusively on coal for propulsion amounted to less than 34 per cent of the world's total.

Of the 869 vessels launched in the world during the year, 153 were between 4000 and 6000 tons, 117 between 6000 and 10,000 tons, and 29 were over 10,000 tons each. The vessels of 20,000 tons and upward built during the year are listed below:

	Tons	Built in
Turbine S.S. <i>Bremen</i>	46,000	Germany
<i>Europa</i>	46,000	"
Turbo-electric, <i>Virginia</i>	20,773	United States
Motorship <i>Kungsholm</i>	20,228	Germany
Turbine S.S. <i>Duchess of Bedford</i>	20,123	Scotland
" <i>Duchess of Richmond</i>	20,022	"
" <i>Duchess of York</i>	20,022	"

During 1928, excluding vessels of less than 1000 tons, 99 vessels of 646,851 tons were launched, built for the carriage of oil in bulk.

As regards countries, those with the largest output recorded during 1928 were as follows:

	Tons
Great Britain and Ireland	1,445,920
Germany	376,416
Holland	166,754
Denmark	138,712
Sweden	106,912
Japan	103,663
United States	91,857
France	81,416

The accompanying table, also from *Lloyd's Register of Shipping*, indicates quite clearly the fluctuation in yearly totals for world tonnage launched during a period of years, and it is to be noted that during the five years, 1924-1928, the average tonnage launched annually in the world was about 268,000 tons less than the average for the five pre-war years, 1909-1913. The following paragraphs show the items of interest in regard to the tonnage launched in various countries during 1928.

GREAT BRITAIN AND IRELAND. While the tonnage launched during 1928, 1,445,920, was 220,047 tons more than for 1927 and represented 53.6 per cent of the world's output during 1928; nevertheless, it was 486,000 tons lower than in 1913, the pre-war record year. It was distributed as follows: England and Wales, 737,531 tons; Scotland, 531,917 tons; and Ireland, 76,472 tons. Distributed as regards leading shipbuilding centres, the production was as follows: The Clyde, 571,948 tons; the Tyne, 300,508 tons; the Wear, 207,646 tons; the Tees, 132,966 tons; Belfast, 75,738 tons; and the Mersey, 73,197 tons. Of the total tonnage launched, 1,153,636 tons were for registration in Great Britain and Ireland, and 292,284 tons were for owners in other countries; this figure being 20.2 per cent of the total tonnage and comparing with 21.8 per cent in 1927 and with 22 per cent for the average percentage in the pre-war years, 1909-1913.

As regards size, 97 vessels of between 5000 and 10,000 tons each were launched, and 16 vessels of 10,000 tons and upwards, the largest being the *Duchess of Bedford*, the *Duchess of Richmond*, and the *Duchess of York* referred to in the preceding table, the turbo-electric vessel, *Viceroy of India*, of 19,000 tons, and the motorship, *Rangitiki*, of 18,000 tons. Excluding vessels of less than 1000 tons, 51 tankers of 300,348 tons were launched during 1928. The average tonnage of steamers and motorships launched in Great Britain and Ireland, excluding vessels of less than 500 tons, was 4656 tons. There were 15 vessels to be fitted with steam turbines with a total of 138,094 tons, one of which, a ship of 19,000 tons, was fitted with turbines in connection with electric motors, and two vessels of 7777 tons which had a combination of steam turbines and reciprocating engines. There were launched during the year 76 motorships of 427,916 tons, the largest of which was the *Hangitiki*, of about 18,000 tons, and 42 others were of 5000 tons and upward.

GERMANY. In 1928 German shipyards launched 81 vessels of 376,416 tons as compared with 105 vessels of 289,622 tons in the preceding year. This total included 15 vessels of 164,813 tons to be fitted with steam turbines and included the two largest vessels launched in the world during the year, the *Bremen* and the *Europa*, listed in the preceding table. Germany's totals for turbine vessels included nine of 45,069 tons which had a combination of reciprocating engines and steam turbines. There were 36 vessels of 177,338 tons to

^a Returns are not available as regards Germany and Austria-Hungary for the war period (1914-18) nor as regards Germany for 1919 and 1920.

be fitted with oil engines, the largest of which were the *Kugsholm*, of 20,223 tons, and the *St. Louis*, of about 15,500 tons. Two tankers were launched of 14,109 tons, one of which was a motorship of 11,500 tons. There were 12 vessels launched between 6000 and 8000 tons, 8 between 8000 and 10,000 tons, and the 5 referred to above exceeding 10,000 tons.

HOLLAND. Exclusive of the vessels used for river navigation (a considerable amount of tonnage), the total tonnage launched during 1928, 166,754 tons, 74 vessels, was 46,964 tons higher than in 1927. The largest vessel launched was the *Nieuw Zeeland*, of 10,906 tons. There were 43 vessels of 85,132 tons to be fitted with internal combustion engines, seven of which were of 6000 tons and upward, the largest being the *Poelau Laut* and *Poelau Roebiah* of about 10,000 tons each. Exclusive of ships of less than 1000 tons, seven tankers of 41,925 tons were launched, five of which of 36,744 tons were motorships.

DENMARK. In 1928 the largest tonnage ever recorded in Denmark, 138,712 tons, was

launched. This was 66,674 tons higher than in 1927 and exceeded the combined output for the six pre-war years, 1908-1913. Of this amount 133,768 tons were motorships, of which 11 between 5700 tons and 9200 tons were launched. A tanker of 3100 tons with internal combustion engines also was launched.

SWEDEN. This country also had in 1928 the greatest output ever recorded, namely, 106,912 tons or 39,551 tons more than in 1927 and slightly in excess of the total output for the pre-war years of 1904-1913. Of this, nearly 97 per cent was composed of motorships of which six were between 5000 and 8000 tons, and six between 8000 and 10,000 tons each. There were launched 10 tankers, all motorships, aggregating 81,060 tons.

JAPAN. In 1928 the output of shipping launched, 103,663 tons, was an increase of 61,304 tons over 1927 and was the largest figure recorded for Japan since 1921. Of the 18 motorships aggregating 58,784 tons, the *Asama Maru*, of 16,780 tons, was the largest, with four others exceed-

ing 6000 tons each. Two turbine steamers of 10,325 tons were launched and three tankers each exceeding 7000 tons.

FRANCE. The output for 1928, 81,416 tons, was 37,081 tons higher than that for 1927 and included 54,764 tons of motorships or more than double the steam tonnage. There were three motorships of between 8000 and 8300 tons each launched and four between 6000 and 8000 tons each. Two steamers exceeding 7000 tons each were launched, as were also seven tankers of 53,863 tons which, with the exception of one steamer of 7670 tons, were all fitted with internal combustion engines.

ITALY. The tonnage launched in 1928, 58,640 tons, was lower than in any year since 1917, although a decrease of 42,436 tons from the 1927 record. There were 19 vessels of 48,436 tons in the Trieste District as compared with the output of 73,955 tons in 1927. The totals included three steamers of 18,417 tons intended for carrying oil in bulk, including the *Juvenal*, of 13,247 tons, launched at Trieste. There were also launched 15 motorships of 35,552 tons.

UNITED STATES. *Lloyd's Register of Shipping* recorded for the United States an output of 91,357 tons launched which was not only considerably less than the 179,218 tons launched in 1927 but was the lowest for 32 years. The tonnage launched included 22 steamers and motorships of 53,195 tons and 30 barges of 24,805 tons built on the Atlantic coast; six steamers and motorships of 5265 tons built on the Great Lakes; and five vessels of 8092 tons built on the Pacific coast. The largest vessel launched during 1928 was the turbo-electric vessel, *Virginia*, of 20,773 tons, built at Newport News, and, next in point of size, the *Mary Ellen O'Neil*, a motorship of 11,628 tons, built at Chester, Pa. A motor tanker of 8942 tons also was launched at Chester, but no other ship exceeding 4000 tons figured in the year's production. The internal combustion engine tonnage launched totaled 28,085 tons, and of oil tankers of 1000 tons and upward, three, aggregating 23,505 tons, were launched.

According to the shipbuilding returns for 1928 compiled by the *Marine Engineering and Shipping Age* (New York), there was a marked decrease in the amount of tonnage built in the United States in 1928 as compared with the previous year. There were reported built and delivered 452 merchant vessels of all types with a total of 231,521 gross tons, the output of 42 shipyards. At the end of the year, 33 American shipyards reported 124 merchant vessels of 104,305 gross tons under construction. The 1928 output represented a decrease of 41.5 per cent as compared with 1927 and an increase of 2.5 per cent over 1926.

At the end of the year, a more hopeful feeling was being manifested and plans and specifications had been or were being prepared for the construction of 20 passenger and cargo vessels for carrying mails to foreign countries under the terms of the Jones-White Act (See SHIPPING). These vessels were to range from 10,000 to 20,000 tons dead weight and from 12 to 18 knots speed and were to be provided with modern facilities for passenger service. Mail contracts awarded to American shipowners during the year provided for the construction, within five years, of 12 additional relatively large and fast combination passenger and cargo vessels.

Of the vessels delivered by shipyards in the United States during 1928, 36, or 35 per cent, with a gross tonnage of 80,934 and a total horse power of 85,605 were propelled by steam and 63, or 15.8 per cent, with a tonnage of 36,451 were motor ships, while the remaining 49.2 per cent were barges or other non-propelled craft. Atlantic coast and Gulf yards constructed 60 per cent of the year's output; Great Lakes yards, 6 per cent; Western river plants, 30 per cent; and West coast yards, 4 per cent.

The notable vessels completed during the year were the electrically driven passenger and freight steamships, *California* and *Virginia*, each of 21,000 tons, built by the Newport News Shipbuilding and Drydock Company for the Panama Pacific Line of the International Mercantile Company, which also had under way a third liner for this service. The Federal Shipbuilding and Drydock Company built the 8100-ton Southern Pacific liner, *Dixie*, and the Ellicott Machine Corporation of Baltimore built the Diesel hydraulic dredge, *Las Cruces*, of 2500 gross tons, for the Panama Canal. A turbo-electric passenger and cargo vessel of 9000 gross tons was placed under contract with the New York Shipbuilding Company of Camden, N. J., by the Grace Line; while the Sun Shipbuilding and Drydock Company of Chester, Pa., had a 10,000 ton passenger and cargo motor ship under construction for the American-South African Line.

The U. S. Shipping Board vessel, *Mercer*, had been in regular transatlantic service without interruption for over a year, using as fuel pulverized coal. Minor difficulties were encountered, principally in securing satisfactory distribution to the three furnaces of the Scotch boilers, but that problem appeared to have been solved by rearrangement of the piping and the use of a pneumatic distributor. All things considered, the cost of operation with pulverized coal (14,000 B. t. u. at \$5 per ton) seemed to be about on a par with oil at \$1 a barrel. The low price of boiler oil, which was to be effective in the year 1929, would temporarily wipe out the margin in favor of pulverized coal for marine use, but how long such a situation would last was uncertain. For vessels in the Pacific and Gulf port trade, oil has a decided advantage.

The Canadian collier, *Lingan*, had been running on the St. Lawrence with pulverized coal for several months, and the English steamer, *Stuartstar*, partly equipped to burn pulverized coal, operated between England and Buenos Aires. The latter vessel employed high-speed mills. The British Admiralty was also reported to be carrying on some investigations along this line.

See also DYNAMO-ELECTRIC MACHINERY and NAVAL PROGRESS.

SHIPPING. Substantial improvement was to be recorded in the world's shipping industry during 1928, and at the end of the year there was a reduced amount of idle tonnage in the various countries, which was accompanied by an expanding sea trade and rising freight rates. On December 31 there was less shipping laid up in the principal maritime countries of the world than at any time since the post-war depression, amounting on Dec. 31, 1928, to 3,947,000 gross tons or a decrease of 352,000 tons or 8 per cent from Jan. 1, 1928, and a decrease of 1,664,000 tons or 30 per cent from Jan. 1, 1925.

The preponderance of laid-up shipping was to be found in the United States and in Great Britain, the former country showing 2,816,000 tons at the end of 1928 as compared with 2,978,000 tons at the end of 1927, and 4,223,000 tons at the end of 1924. Great Britain at the end of 1928, had 467,000 tons laid-up, as compared with 539,000 tons at the end of 1927.

April-June	109	110	96	89	107	92
July-September	104	102	98	101	104	97
October-December	107	102	99	124	103	105

^a As there were no exports of coal from the United Kingdom during May-November, 1926, the index numbers for this period were based on the remaining available routes, as shown in the Transportation Division's table of the Department of Commerce.

In regard to freight rates the Transportation Division of the U. S. Department of Commerce reported that during 1928 a decline in freight rates not only was checked in the third quarter but in the final three months a substantial gain was scored: The trend of freight rates is indicated in the accompanying table from *Commerce Reports*.

In 1928 vessels with a tonnage capacity of 80,207,772 entered ports of the United States and with a tonnage capacity of 80,663,836 cleared, as compared with total entries of 74,309,813 and clearances of 75,440,332 in 1927.

Of this total, 39 per cent of the entries in 1928 were American vessels; as against 39.41 per cent in 1927; and of the clearances 39.35 per cent as against 39.49 per cent in the earlier year. Of the American tonnage entering the United States ports in 1928, 31,284,611 tons, 22,970,848 tons was with cargo and 8,313,763 was in ballast, while of the clearances, 31,734,381 tons, 21,802,009 tons was with cargo and 9,932,012 in ballast.

The world's merchant fleets, disregarding sailing vessels and all wood vessels at the end of June, 1928, according to *Lloyd's Register of Shipping*, amounted to 61,594,000 tons, a figure that can be compared with 42,514,000 tons at the end of June, 1914, immediately before the World War. Studying these figures further, it is interesting to note that tankers had increased since 1914 from 1,479,000 tons to 6,544,000 tons, and motor ships, including sailing vessels fitted with auxiliary power, from 234,000 tons to 5,432,000 tons. In regard to the relative use of coal and oil fuel for boilers, a great change had taken place, since in 1914 the tonnage of steamers fitted for oil fuel was 1,310,000 tons, while in 1928 the corresponding figures indicated over 19,000,000 tons.

The Twelfth Annual Report of the U. S. Shipping Board covering the fiscal year ended June 30, 1928, indicated a substantial advancement in the Government's policy of transferring Shipping Board tonnage to private American control. During the fiscal year, four complete lines aggregating 45 vessels having 401,802 dead-weight tons and an additional two vessels having

18,260 dead-weight tons were sold for guaranteed operation. In addition to these, 20 ships with a total dead-weight tonnage of 133,942 were sold to private American owners. This record brought the total sales to June 30, 1923, up to 1557 with an aggregate dead-weight tonnage of 7,587,238. Fifteen established lines were included in this total.

With the sales completed as of the date of the report, a total of only 758 vessels remained in the Government's possession. The fiscal year 1927-28 saw the sale of all the Government's remaining lines on the Pacific Ocean. The twenty-one established lines which were still being operated by the Shipping Board on June 30, together with 505 ships in the laid-up fleet, were offered for sale to American citizens at low prices and on attractive terms. While the year was a notable one in the matter of sales, the report indicated that the Jones-White measure, providing more liberal ocean mail rates and ship construction loans, was further stimulating the desire of American citizens to take over the Board's remaining ships.

The report set forth the eight recommendations for the advancement of the American merchant marine. Should these recommendations receive the attention of Congress, it was believed that they would result in advantages to private shipping under the American flag. The recommendations were as follows:

1. The legal department of the board has spent several years in codifying the navigation laws, and the resulting code, together with a comprehensive bill amending and revising it, will again be presented to Congress at the opening of the next session. The enactment of the code should no longer be delayed.

2. Changes should be made in the present laws relating to the division of damages in cases of collisions of vessels at sea, to conform in principle to the proposals of the International Marine Convention of 1910. These changes should be brought about by legislation rather than by treaty.

3. Recommendation is made that legislation looking to the adoption of The Hague rules, substantially as provided for in H. R. 12208, introduced at the last

session of Congress, should be enacted at an early date.

4. A load-line bill should be enacted into law prior to the forthcoming International Conference on Safety of Life at Sea, which is scheduled to be held in London in the spring of 1929. The United States Load Line Committee (1928), formed during the period covered by this report, is now making a comprehensive study of this subject and at a later date will doubtless submit its recommendations to Congress.

5. Provision should be made for tax exemption on American vessels operating in foreign trade, including a provision whereby deductions shall be allowed from taxable incomes derived from operating profits to the extent that such profits are devoted to new ship construction in American yards.

6. Legislation should be enacted looking to the transfer to privately owned American shipping interests of the peace-time business now handled by Army and Navy transports and by the vessels owned and chartered by the Panama Steamship Line.

7. Funds should be provided to carry into effect the act of Congress approved February 28, 1925, providing for the creation of a naval reserve.

8. Congress might well give further consideration to the question of marine insurance, to the end that there may be established an insurance system which will place American vessels on an equality with foreign vessels in this important respect.

The Jones-White Act, as the Merchant Marine Act of 1928 became known, was approved by President Coolidge on May 22, 1928. It came as the result of a conference on the American merchant marine held in Washington January 10 and 11, 1928, in which a number of steamship men met with the members of the Shipping Board. The outcome of their deliberations was the Merchant Marine Act of 1928, which contained the following important provisions:

1. Prohibits sale of vessels by the Shipping Board except when in its judgment the building up and maintenance of an adequate merchant marine can be best served thereby, and then only upon the affirmative vote of five members of the board.

2. Authorizes the board to remodel and improve its vessels so as to equip them adequately for competition in the foreign trade of the United States.

3. Recognizes the necessity for replacements and additions in the Government fleet, in order "to give the United States an adequate merchant marine," and authorizes and directs the board to present to Congress,

from time to time, recommendations as to new construction.

4. Increases the construction loan fund to \$250,000,000 and liberalizes the terms under which loans may be made for new construction or for reconditioning, remodeling, or improving vessels already built. The loan period is extended to 20 years; a lower interest rate is provided for vessels operated in foreign trade; and loans are authorized for sums equal to three-fourths the cost of the vessel or vessels to be constructed, or for three-fourths the cost of the reconditioning or remodeling work.

5. Provides increased compensation at a stipulated rate per nautical mile, based on a graduated scale of speed and tonnage, for the carriage of ocean mails in vessels registered under the laws of the United States. (For detailed schedule of rates, see report of Bureau of Traffic.) The Postmaster General is authorized to enter into contracts with citizens of the United States whose bids are accepted, for the carrying of mails, the term of such contract not to exceed 10 years.

6. Permits naval officers of the United States to volunteer for service on mail-carrying vessels of the merchant marine. When accepted by the owner or master thereof, they may be assigned to this duty by the Secretary of the Navy. While in such employment, naval officers shall receive from the Government half pay and from the owner or master of the vessel such other compensation as may be agreed upon.

7. Authorizes the board to create an insurance fund to be used in insuring the legal or equitable interest of the United States (1) in any vessel constructed or in process of construction, and (2) in any plants or property in the possession or under the authority of the board.

8. Directs that officers and employees of the United States traveling on official business overseas shall, when practicable, travel on ships registered under the laws of the United States.

9. Provides that in national emergency the Federal Government may seize and purchase or use for national defense (1) any vessel in respect of which a loan is made from the construction loan fund, at any time during the life of the loan; and (2) any vessel in respect of which an ocean-mail contract is made under the provisions of the act, at any time during the life of the contract.

10. Reaffirms the policy and primary purpose set forth in section 7 of the Merchant Marine Act of 1920.

The report of the Shipping Board reviewed the progress made under the Merchant Marine Act of 1928, the Jones-White Law. Optimism for the beneficial effects of this law was expressed.

It is too soon to attempt to evaluate the actual results of the working out of this measure, but already—June 30, 1928—there are indications that considerable new construction in American yards will be undertaken at an early date, while other signs point to a stimulated desire on the part of private American citizens to acquire some of the steamship lines now being operated by the board. The new measure may therefore be said to give every reasonable indication of accomplishing the three main purposes for which it was enacted, namely, to assist in the development of the American merchant marine generally, to aid in increasing the foreign commerce of the United States, and to facilitate the transfer of the Government's war-built fleet and established services to private American ownership. With a full understanding of the magnitude of its task and of the economic problems facing it, the board realizes that these purposes cannot be accomplished overnight. The enactment of the Merchant Marine Act of 1928, supplementing the legislation previously enacted, should be looked upon as aiding in the solution of current problems, but not as eliminating them altogether.

Due to constantly fluctuating conditions in the world's ocean-carrying trade, the shipping problem, far from being static and fixed, is always changing. It follows that unless our plans for the merchant marine are made flexible, in order to meet changing conditions, we may find that the remedy which effectually disposes of the problems of today will completely fail to solve those arising tomorrow. Of one thing we may be sure—the American shipping industry cannot stand still. If it does not keep abreast of the times, it will be forced into a subordinate position by the activities of its foreign competitors. For example, the number of ships being built at the present time in foreign yards indicates that in the matter of new construction we are rapidly being outdistanced by some of the other maritime nations, the latest figures showing that for every ocean-going ship that we are building Great Britain is building 50, Germany

10, France and Italy each 5, and Japan 4. How effective the Merchant Marine Act of 1928 will be, in stimulating activity in American shipyards remains to be seen.

The U. S. Commissioner of Navigation, in his annual report for the fiscal year 1927-28, stated that on June 30, 1926, the merchant marine of the United States including all kinds of documented craft comprised 25,385 vessels of 16,683,061 gross tons of which 2336 seagoing vessels of 10,882,793 gross tons were of 1000 tons or over, compared with 2447 vessels of 11,071,918 gross tons on June 30, 1927. Of the 1928 tonnage, 1201 vessels of 6,161,871 gross tons were engaged in the foreign trade and 1494 vessels of 5,002,487 gross tons in the coasting trade. These figures may be compared with the maximum volume of tonnage in the foreign trade, 10,699,596 gross tons, which was reached on June 1, 1921. In contrast with the decrease in the foreign trade, the coasting trade exclusive of the trade on the Great Lakes had increased 2,558,041 gross tons. During the fiscal year, 969 vessels of 257,180 gross tons were built and documented by the Bureau of Navigation, as against 882 vessels of 245,122 gross tons in 1927. This new tonnage included 12 steel passenger steamers of 75,258 gross tons, 4 steel cargo steamers of 32,228 gross tons, 2 steel tankers of 13,116 gross tons, and 1 ferry of 2767 gross tons. There were building or under contract to build in the United States shipyards on July 1, 1928, 483 vessels of 264,410 gross tons, as compared with 882 vessels of 245,122 gross tons built and 280 vessels of 219,044 gross tons under contract to build in 1927.

The accompanying summary prepared by the Division of Statistics of the U. S. Shipping Board shows the employment of American steam and motor merchant vessels of 1000 gross tons and over on Dec. 31, 1928. The table does not include lake and river tonnage.

There were 38 vessels of 178,603 gross tons employed in nearby foreign service, while in South American service 5 vessels of 59,366 gross tons were trading with the east coast and 6 vessels of 36,492 gross tons, with the west coast. In transatlantic service, 12 vessels of 205,152 gross tons were trading with Atlantic ports of Europe and the United Kingdom. In the transpacific service, 9 vessels of 127,286 gross tons were on lines to the Orient and the Far East; 3 vessels of 17,994 gross tons, with Australia; and 8 of 87,875 gross tons, were on regular round-the-world service. The above figures accounted for 31 passenger and combination ships of 712,768 gross tons in foreign service. American vessels in coastwise service totaled 89 of 458,913 gross tons and were all privately owned. There were 37 of 175,473 tons in the Atlantic and the Gulf trade; 27 of 87,332 tons were on the Pacific; 8 of 82,311 tons ran on intercoastal routes; 12 of 90,231 tons to Hawaii; and 5 of 23,566 tons to Porto Rico. The general cargo ships of the United States merchant marine totaled 1429 of 6,666,147 tons of which 408 of 1,640,586 tons were in the coastwise trade; while 471 of 2,535,680 gross tons were in the foreign trade. Of these last, 225 of 1,108,301 gross tons were privately owned; while 244 of 1,422,178 gross tons belonged to the United States Government. The total number of tankers in the United States merchant marine was 361 with a gross tonnage of 233,-

278, of which 354 with a tonnage of 2,288,765 were privately owned, and 7 of 44,513 gross tons were government owned. In foreign commerce, 111 tankers of 751,994 gross tons were engaged, all of which with the exception of one craft of 7,045 tons was privately owned. In the coastwise trade 218 tankers of 1,397,115 tons were engaged, all but one of which of 629 tons was privately owned.

the south. Capital and principal city, Bangkok. AREA, POPULATION, ETC. The area is estimated at 200,148 square miles and the population, according to the census of 1919-20, 9,207,355; estimated in 1925-26, 9,831,000. Buddhism is the prevailing religion. On Mar. 31, 1926, there were 16,185 Buddhist temples and 129,206 priests. On Mar. 31, 1925, government schools numbered 343, including 236 secondary depart-

SHOOTING. The international rifle matches of 1928 were held in Holland, the Swiss team capturing the team title, with Sweden second and the United States third. The world's .22-calibre team honors went to the United States, Great Britain finishing second. The individual championship was won by Olle Eriksson of Sweden with Reich of Switzerland second. See OLYMPIC GAMES.

Three thousand competitors participated in the United States national tournament at Camp Perry, Ohio. The individual title went to Carl Cagle of the U. S. Marine Corps with a score of 286 out of a possible 300. Sergeant H. R. King of the Marines captured the President's match with 146 out of 150. The national team honors were won by the Marine Corps. The United States riflemen defeated a Cuban team in the Palma Trophy competition by a score of 1731 to 1696.

Trapshooting retained its popularity throughout the United States during 1928, with the Grand American Handicap tournament furnishing the high light of the season. The winners of the various events were: handicap, Ike Andrews, Spartanburg, S. C.; champion of champions, C. R. Brand, Chicago; professional, Earl Donohue, Ottumwa, Iowa; North American, Mark Arie, Champaign, Ill.; women's national, Miss Kitty Boyer, Mt. Carmel, Pa.; doubles, Class A, Frank Troeh, Portland, Ore.

SIAM, si-ám'. A monarchy in southeastern Asia, bounded by Burma on the west, French Indo-China on the east, and the Gulf of Siam on

ments, with 47,268 pupils and 1958 teachers. There were also 65 special (technical) departments in government schools with 1101 pupils, principally for the training of teachers. Local schools numbered 4707, with 527,603 pupils and 9872 teachers. Private schools numbered 573, with 27,435 pupils and 1446 teachers. Over 90 per cent of the local schools and 60 per cent of the government schools are situated in temples. There is a university at Bangkok.

PRODUCTION. The principal occupation of the people is agriculture, and the chief article of production as well as of export is rice. The area under rice in 1925-26 was 4,076,900 acres and the yield 2,209,900 tons. The livestock on Mar. 31, 1926, consisted of 8389 elephants, 247,158 horses and ponies, 4,013,882 bullocks, and 4,216,127 buffaloes. The forest resources are extensive and teakwood is an important product, the exploitation of which is almost entirely in the hands of the British. The mineral resources are varied and extensive and include coal, zinc, tin, iron, tungsten, wolfram, manganese, and antimony. The output of metallic tin in 1925-26 was 7885 tons.

COMMERCE. For the fiscal year ended Mar. 31, 1928, the foreign trade of Bangkok, through which 85 per cent of Siam's trade passes, exceeded all previous records. Exports valued at 234,000,000 ticals (\$105,300,000), registered an increase of 37,000,000 ticals (\$16,650,000), or 18 per cent over shipments of the fiscal year 1926-27, and imports, valued at 178,500,000 ticals (\$80,325,000), advanced 3,500,000 ticals (\$1,575,000). For the previous five years the export trade averaged 176,000,000 ticals (\$79,200,000) in value and the import, 152,000,000

ticals (\$68,400,000). The advance in export trade was attributed entirely to the large export crop of rice, while the increase in imports reflected the steady increase in buying of general merchandise which has characterized the import market of Bangkok since 1922.

FINANCE. The budget for 1927-28 provided revenues of 108,668,000 ticals and expenditures of 108,134,000 ticals. The public debt of Siam on Mar. 31, 1927, was \$58,972,000. A bill was passed by the Siamese Government in May, 1928, introducing the baht, a new currency unit having the same value as the tical which it replaces. The change was made, it was said, because of the foreign origin of the word "tical." The baht is divided into 100 satangs. Like the tical, the baht is a silver coin; so also are the 50- and 25-satang pieces. The 10- and 5-satang pieces will be nickel and the single satang, bronze. Notes and baht coins were to be legal tender without limit as to amount; 50- and 25-satang pieces would be legal tender up to five baht and the lesser coins up to one baht. The baht is equivalent to 0.66567 grams of fine gold. Gold parity is maintained by a regulation which places the minister under an obligation to receive and deliver gold or gold exchange in exchange for legal tender money at rates corresponding with the gold parity, after allowing for transport charges.

COMMUNICATIONS. In 1926-27, 1042 vessels of 1,131,105 tons entered and 1041 of 1,127,984 tons cleared the port of Bangkok. In 1927 there were 1701 miles of railway in operation. The railroads in that year carried 6,095,000 passengers, 1,113,000 long tons of freight, and had gross receipts of 16,857,000 ticals.

GOVERNMENT. Executive power is vested in the King, who is assisted by a consultative Ministry comprising nearly all the king's relatives; and legislative power in a council composed of the State Ministers and members appointed by the Crown. King in 1928, Prajadhipok, born Nov. 8, 1893, succeeded to the throne on the death of his brother, Rama VI, on Nov. 26, 1925.

SIBERIA. The northern Asiatic part of Russia. Area, estimated in 1926 at over 5,000,000 square miles; population in 1924 estimated at 12,800,000. Rich and important as were the mining, forest, and fur resources of Siberia, 90 per cent of the population lived in rural districts, and the most important productive activities were agriculture and the industries allied with it. This condition was likely to persist for many years, as it would take much capital not yet available, and a long period of time, to develop Siberia industrially. Siberia is one of the world's important sources of furs, and trapping is of considerable economic importance over large portions of the country, particularly in the forest and tundra region. The development of the mineral wealth of Siberia is second in importance only to the development of its agriculture. The industries of Siberia include flour mills, distilleries, breweries, tanneries, and soap and tallow works. In 1927, the acreage of crops in Siberia was estimated at 7 per cent above that in pre-war times, and of that acreage wheat occupied over 50 per cent, as against 35 per cent in 1923. Livestock was increasing in numbers, with horses nearly as numerous as in pre-war times, cattle 20 per cent more numer-

ous, and sheep and goats twice as numerous. The gross value of the industrial output had increased by 100,000,000 rubles (gold) in two years. The trade turnover was nearing the 1,000,000,000-ruble mark, whereas two years previously it aggregated only 500,000,000 rubles. In its plans for the development of Siberia, the Soviet Government gave first place to the basic industries, such as coal and gold mining and metallurgical work, and second place to the more profitable of other industries, such as wood-working, paper, glass, pottery, and the production of agricultural implements. See *RUSSIA*.

SIEMENS, ALEXANDER. British engineer, died at London, February 16. He was born at Hanover, Germany, Jan. 22, 1847. He was a member of a well-known German family of engineers. In 1867 he went to England to work in the shops of Siemens Brothers at Woolwich, and in 1868 went to Persia to assist in the building of the Indo-European telegraph line. He had a part in the laying of the cable under the Black Sea in the following year. He was recalled to Germany to serve in the Franco-Prussian War, in which he was wounded. Returning to England he became a pupil of the late Sir William Siemens, and was engaged in building regenerating gas furnaces in various countries, including Canada and the United States, and in laying submarine cables, 1875-78. In the latter year he became a naturalized British subject. In 1879 he took over the management of the electric light department of Siemens Brothers, and after the death of Sir William Siemens in 1883 assumed a prominent position in the firm, ultimately becoming chief permanent director resident in England. He was honored by British engineers with the presidency of the Institute of Electrical Engineers, 1894 and 1904, and that of the Institute of Civil Engineers, 1910-11. He wrote many papers, on scientific and technical subjects, that were read before professional societies.

SIERRA LEONE, sê-ër'ra lê-ô'nê. A British colony and protectorate on the west coast of Africa; bounded by French Guinea on the north and Liberia on the east and southeast. The approximate area of the colony is 4000 square miles and the population, according to the census of 1921, 85,163, of whom 1161 were Europeans. The chief city is Freetown, with a population in 1921 of 44,142. The birth rate in 1926 was 24 per thousand and the death rate 27.9 per thousand, infant mortality being 296 per 1000 registered births. Freetown is the chief seaport in West Africa, being a coaling station and the headquarters of the British Imperial forces in West Africa. Vessels entered and cleared in the foreign trade in 1926 had a tonnage of 4,058,059. The total exports in 1926 amounted to £1,713,646; imports £1,844,122; revenue (1926), £855,440; expenditure, £957,155; public debt, £1,729,848. The total railway mileage open to traffic, with sidings, was 356 miles. The receipts from all sources for 1926 amounted to £228,527; expenditures, £184,288.

The protectorate is situated between 6° and 10° N. latitude and 10° and 14° W. longitude, and its greatest extension inland is 180 miles. Area, 27,000 square miles; population, according to the census of 1921, 1,456,148, of whom 1,450,903 were natives. The chief exports are palm kernels, kola nuts, and palm oil. It is

divided into three provinces, with a European commissioner at the head of each. The governor and commander-in-chief of the colony is also governor of the protectorate. He is assisted by an executive and legislative council. Governor and Commander-in-chief in 1928, Brig. Gen. Sir J. A. Byrne.

SIGNALS, RAILWAY. See RAILWAYS.

SILESIA, si-lé'shā. The term applied to (1) a division of the former Austro-Hungarian Empire; (2) a province of Prussia. The former, previously a crownland of Austria, became after the War a part of the new Republic of Czechoslovakia (see CZECHOSLOVAKIA). Its area is 1708 square miles; population, according to the census of 1921, 672,268. The Province of Silesia in Prussia was originally the largest division of that State, with an area of 15,573 square miles and a population of 5,225,962 in 1910. After a plebiscite in 1921, Upper Silesia was

established and arrangements were made for a definite basis for the various transactions. Future contracts formed an important feature of the business of the silk exchange and it was believed that the industry would be stabilized through the facilities thus provided.

In the United States, the silk industry continued on rather an even basis during the year with but slight variation in the activity of machinery and production with declines registered in both respects toward the end. While the usual decline occurred during the year, it was rather less than in 1926 and 1927, and indicated stability of values. In the broad-loom industry, conditions, continued on an even basis throughout the year, with a quieter demand at the close. It was realized that the silk industry required adjustment due to the increasing use of rayon which had attained even greater popularity in 1928 than in the previous year.

^a The production of raw silk in China is an unknown quantity, therefore expert figures have been used.

^b Excludes tussah silk.

The domestic consumption of raw silk (including tussah) in China is estimated to be 52 per cent of the production. The exports from Canton and Shanghai during the season 1927-28 were 18,000,000 which would indicate a crop of approximately 41,000,000 pounds. The Japan crop was estimated at 80,000,000 pounds.

divided between Germany and Poland, leaving under the control of Prussia an area of 14,022 square miles (Upper and Lower Silesia), with a population in 1925 of 4,504,103; and transferring to Poland an area of 1240 square miles, with a population of 891,669 in 1921.

SILK. The raw-silk industry in 1928 was on the whole prosperous, with stable conditions prevailing in Japan, China, and Italy and increased consumption in the American market to which is exported a large portion of the silk produced in Asia. In Japan, the reellers experienced a prosperous year and higher prices were obtained in many cases for their product. An American technical committee visited Japan during the spring and was in conference with representatives of Japanese silk organizations and firms regarding raw-silk classification. At these conferences, an analysis was made of the problems confronting the industry and plans were inaugurated for an international raw-silk conference to be held in the United States during 1929. On September 11, a national Raw-Silk Exchange was opened in New York and functioned satisfactorily throughout the year. This exchange was able to create a recognized price basis and formed a connecting link between the supply market in Japan and the consumer in the United States. A grading and warehousing committee, as well as an inspection bureau, was

During the calendar year 1928, the Silk Association of America reported total imports of raw silk amounting to 566,378 bales and deliveries of 571,010 bales, as against imports of 552,441 bales, and deliveries of 551,379 bales in 1927, and imports of 504,200 bales and deliveries of 501,546 bales in 1926. On Jan. 1, 1928, there were reported in storage 53,540 bales and at the end of December, 408,908 bales. The raw silk imported in 1928, according to the Department of Commerce, was valued at \$367,997,250 as against \$390,365,475 in 1927, there being an increase in quantity as noted above, and a decrease in value. Silk was the largest single import into the United States in 1928 and in ten years had increased approximately 121 per cent. Silk imports in 1928 were distributed as follows: France, 40,081 pounds, valued at \$243,043; Italy, 792,231 pounds, valued at \$3,599,571 (an increase from \$2,715,961 in 1927); China and Hongkong, 10,527,407 pounds, valued at \$45,948,666 (a decrease from \$49,774,659 in 1927); Japan, 64,111,650 pounds, valued at \$318,123,930 (a decrease from \$334,160,383 in 1927); and other countries, 17,946 pounds, valued at \$81,680.

^a Value at 58.5¢ per ounce, the average New York price of bar silver.

The preliminary estimate indicated a reduction in silver output, as compared with 1927, which was 4,414,173 ounces. In the year of largest output, 1915, there were produced 74,961,075 ounces of silver.

The average price of silver in New York in 1928 was 53.17¢ cents an ounce, as compared with 56.370 cents in 1927, 62.107 cents in 1926, and 69.065 cents in 1925, the year before the Indian Currency Commission decided to put India on a gold currency basis and sell over a period of years 700,000,000 ounces of silver in order to obtain the gold necessary to carry out the scheme. Naturally, the effect was to depress the value of silver as India had absorbed some 30 per cent of the annual production of the world. This plan later was modified and China engaged in extensive buying, though it was uncertain whether the Republic, as a result of the researches of the Kemmerer Commission seeking to develop the stabilization of Chinese currency, might not adopt for that country also the gold standard. On the other hand, the tendency continued during the year 1928 toward the increased use of silver in many of the industrial arts.

During 1928, the United States exported silver valued at \$87,382,000, as compared with \$75,625,000 in 1927 and \$92,258,000 in 1926. Imports of silver into the United States were as follows: 1928, \$68,117,000; 1927, \$55,074,000; and 1926, \$69,596,000.

SIMMONS COLLEGE. A non-sectarian college for women at Boston, Mass., founded in 1899. The enrollment on Nov. 1, 1928, was 1459, distributed among the following schools: Household economics, 277; secretarial studies, 493; library science, 212; general science, 76; social work, 161; Prince School of Store Service Education, 64; public health nursing, 176; students in economic research, 3. There was an enrollment of 265 in the summer session. The faculty numbered 130, including 3 on leave of absence. The productive funds of the institution amount-

ed to \$3,290,296, and the income for the year was \$495,416. The library contained 44,000 volumes. The president was Henry Lefavour, Ph.D., LL.D.

SIMON COMMISSION. See INDIA, under *History*.

SIMS, CHARLES. English artist, died at St. Boswells, Scotland, April 13. He was born at Islington, London, in 1873. At the age of fourteen he entered the employ of a commission agent at Paris, but at seventeen turned to art as a career. He studied at the National Art Training School, at South Kensington, London, but a year later he was again in Paris, as a student at the Académie Julian, under Constant and Lefebvre. He studied at the Royal Academy schools, also, and won exhibit space at the Academy in 1894, when he was only twenty-one. From that time until 1926 he was closely associated with the Academy, first as an associate academician in 1908, then as academician in 1915, and as keeper, 1920-26. In the meantime the merit of his work—which is marked by poetical invention, charming color, and fine craftsmanship if not by greatness in design—had won international recognition as well as fame at home. He is represented in the Tate Gallery by *The Fountain* and *The Wood Beyond the World*, a work of poetic fancy; and his paintings hang in the Municipal Gallery at Leeds, England, and in several other galleries in the British Dominions. His *Childhood* is in the Musée de Luxembourg, Paris. He received a gold medal at the international exhibition at Amsterdam in 1912, and another at the Carnegie Institute of Pittsburgh, Pa., in the same year.

SINHA, LORD (SATYENDRA PRASSANO SINHA, FIRST BARON SINHA OF RAIPUR). Indian lawyer and statesman, died March 16. He was born Mar. 24, 1864. He was educated at Birbhoom Zilla School, and subsequently at the Presidency College, Calcutta, where he was a scholar. In 1881 he went to England, read law at Lincoln's Inn, and was called to the bar in 1886. He practiced as a barrister at Calcutta, in the High Court, before becoming standing counsel for the Government of India in 1903. He was advocate general of Bengal, 1907-09, and again 1915-17; a representative of India in the imperial War conference of 1917, and a member of the imperial War cabinet in 1918; under-Secretary of State for India, 1919-20, and Governor of Bihar and Orissa, 1920-21. He was the first native to become a member of the council of the Viceroy of India, of the British House of Lords and of a British Ministry, and he was highly esteemed in England for his unwavering loyalty to the Crown, especially in the days of the World War. In 1914 he was knighted, in 1918 he was made a King's Counsel, and in 1919 he was raised to the peerage and admitted to the Privy Council. He was invested with the rank of Knight Commander of the Order of the Star of India in 1921 and in 1926 he became a member of the judicial committee of the Privy Council.

SIX COLLECTION. See ART SALES.

SKATING. The most important ice-skating competitions of 1928 were those held in connection with the Olympic Games (q.v.), in which the European contestants carried off practically

every championship. Irving Jaffe of New York had won the 10,000-meter race, apparently, but the officials cancelled the event because of the soggy condition of the ice. The International Skating Federation ruled that this race must be run over, but there was no opportunity to have this done. Clas Thunberg of Finland won the 1500-meter title, while Ivar Ballengrud of Norway took the 5000-meter championship. Thunberg and Bernt Evensen of Norway tied in the 500-meter race and established a new record of 43 $\frac{3}{4}$ seconds. The figure-skating honors went to Gillis Grafstrom of Sweden in the men's competition and Sonja Henie of Norway took the women's title.

In the United States championships, Allan Potts of Brooklyn won the national indoor crown and Miss Elsie Muller of New York successfully defended her woman's laurels. Roger F. Turner of Boston won the men's national figure-skating title, Miss Maribel Vinson triumphing in the women's contest. Percy H. Hohnston of Cleveland, Ohio, established a new amateur record of 2 minutes, $\frac{2}{5}$ seconds, for three-quarters of a mile indoors. Loretta Neitzel of Detroit covered 100 yards in 11 $\frac{3}{5}$ seconds and one-sixth of a mile in 23 $\frac{3}{5}$ seconds, both being new marks. Irving Jaffe skated one mile in 2 minutes, 30 $\frac{3}{5}$ seconds, for a new record at Oslo, Norway.

SKINNER, CHARLES RUFUS. American educator, died at Pelham Manor, N. Y., June 30. He was born at Union Square, N. Y., Aug. 4, 1844. He was educated at the Mexico (N. Y.) Academy and the Clinton Liberal Institute. He was a member of the New York State Assembly (1877-81) and of the National House of Representatives (1881-85). From 1895 to 1904 he was New York State Superintendent of Public Instruction, having been previously deputy superintendent for six years. As head of the schools of the State, he advocated the restriction of the use of public money to elementary schools, leaving institutions of higher education to private enterprise and endowment. He was assistant appraiser of the Port of New York, 1906-11; librarian of the New York Assembly, 1914, and legislative librarian at Albany, N. Y., 1915-25, retiring in that year. He wrote: *New York Question Book* (1890); *Manual of Patriotism for the Schools of New York* (1900); *The Bright Side* (1909).

SKOULLOUDIS, STEPHANOS. Greek statesman, died at Athens, August 20. He was born on the Turkish island of Chios, 1838, and after studying law at the University of Athens, he managed his father's banking business at Constantinople. Having been a member of the revolutionary committee of Crete, 1867, he later used his influence toward freeing the island from the domination of the Turks. He moved to Greece, 1879, and entered Parliament; he was appointed Minister to Spain four years later, and in 1892 he was made minister of marine, and also of education. After serving as Foreign Minister from 1897, he retired in 1906, but, urged by Premier Venizelos, he consented to represent Greece at the London Conference, at the end of the Balkan War. Skouloudis was made Prime Minister in 1915, and during his year of service he held his country to strict neutrality, refusing to allow either Allied or German troops to pass through Greek territory. He and the members

of his cabinet were accused by Venizelos of plotting a revolt in behalf of the former King Constantin, but they were acquitted by the National Assembly after being tried before a special high court, 1818-20. Refusing to reënter political life, Skouloudis, after 1921, devoted himself to the study of history and politics.

SLANG. See PHILOLOGY, MODERN.

SLATE. The slate quarries of the United States, according to the U. S. Bureau of Mines, produced in 1928 slate valued at \$10,551,000, as against a production valued at \$11,380,736 in 1927, a decline of 7 per cent. The decrease in output held in most of the different branches of the industry, roofing slate estimated at 430,000 squares, valued at \$4,473,000, decreasing 8 per cent in quantity and 10 per cent in value. The total sales of mill stock, estimated at 8,860,000 square feet, valued at \$3,430,000, decreased 5 per cent in quantity and 3 per cent in value. Mill stock for structural slate—2,483,000 square feet, valued at \$1,044,000—increased 3 per cent in quantity and 11 per cent in value, but electrical slate—1,230,000 square feet, valued at \$1,008,600—decreased 13 per cent in both quantity and value. Mill stock for blackboards and bulletin boards—3,375,000 square feet, valued at \$1,103,000—decreased 10 per cent in quantity and 1 per cent in value in 1928. Slate for school slates—1,833,000 pieces (975,000 square feet), valued at \$22,200—increased 26 per cent in quantity and 11 per cent in value. Slate for billiard-table tops—380,000 square feet, valued at \$134,200—decreased 6 per cent in quantity and 5 per cent in value. Slate for vaults and covers—417,000 square feet, valued at \$118,000—decreased 21 per cent in quantity and 16 per cent in value. The sales of crushed slate for roofing granules and flour in 1928 were estimated at 413,000 short tons, valued at \$2,474,000. This represented a decrease of 10 per cent in quantity and 11 per cent in value. There was apparently a considerable increase in the quantity of slate sold for flagging, cross-walks, stepping-stones, etc.

SLAVIC LANGUAGES AND LITERATURE. See PHILOLOGY, MODERN.

SLEEPING SICKNESS (ENCEPHALITIS). The movement of epidemic encephalitis or sleeping sickness (which is not to be confused with African sleeping sickness) was given in the July number of the monthly reports of the epidemiology of the world which are issued by the League of Nations. In England the disease first appeared in 1918 but did not assume epidemic behavior until the winter of 1920-21. There was a second cumulation of cases in the winter of 1923 and a third in the spring of 1924 which was quite severe. Since then there had been a slow recession. In Sweden there were epidemics in 1920-21 and 1923; after which all suggestion of epidemic incidence was missing. Switzerland presented three epidemics in 1920, 1921, and 1923, but since then the incidence had been purely endemic and slight. Italy showed a severe epidemic in 1920 and mild ones in 1924 and 1925. Other countries were not mentioned specifically, but the rule was that epidemic has given way to endemic incidence. Under present conditions, although notification is compulsory, it is largely disregarded. This is aggravated by the difficulty in recognizing mild cases which escape notification for that reason. On the other hand many cases sent to hospitals

as encephalitis prove to be something else—in Glasgow for example 30 per cent of diagnoses proved erroneous.

SLOANE, slōn, WILLIAM MILLIGAN. American historian and university professor, died at Bayhead, N. J., September 11. He was born in Richmond, Ohio, Nov. 12, 1850, and in 1868 was graduated from Columbia College. After teaching the classics for four years at the Newell School in Pittsburgh, he went to Germany, as private secretary to the historian, George Bancroft, who was at that time the United States Minister to Berlin. While abroad Sloane studied history under Mommsen and Droysen, and in 1876 he received a Ph.D. from the University of Leipzig. On his return to America in the same year, he joined the Princeton faculty as professor of history. He taught at Princeton for twenty years, becoming a full professor in 1883, and editing the *Princeton Review* from 1886 until 1889. In 1896 he resigned his position to accept a professorship of history at Columbia, which he held until 1916, when he retired and was made professor emeritus. He had received the degree of L.H.D. from Columbia in 1897 and in the year he left Princeton that university honored him with the A.M. In 1911 Professor Sloane was elected president of the American Historical Society, and he was at one time president of the National Institute of Arts and Letters. He was an energetic charter member of the American Academy of Arts and Letters, and in 1920 he succeeded William Dean Howells as its president.

Professor Sloane's active and creditable work as author and teacher was recognized by Rutgers in 1898, and by Princeton in 1903, receiving from both institutions the LL.D. degree. He also was made an officer of the French Legion of Honor and of the Swedish North Star. The most widely known of his writings is *The Life of Napoleon Bonaparte* (4 vols., 1896; rev. and enlarged ed., 1911). Other of his works include: *Life and Work of James Kenneth Wilson Sloane* (1888); *The French War and the Revolution* (1893); *Life of James McCosh* (1896); *The French Revolution and Religious Reform* (1901); *Party Government in the United States of America* (1914); and *The Balkans* (1914); *The Powers and Aims of Western Democracy* (1919); and *Greater France in Morocco* (1924).

SMALL POX AND VACCINATION. POST-VACCINAL ENCEPHALITIS. Since this accident of vaccination was first observed in 1923 several official reports as to its incidence and nature have been made public, one of the latest being that of the Commission of the League of Nations, which may be found in the *British Medical Journal* for Sept. 29, 1928. The chief incidence has been in Holland and in Great Britain. As far as known not a single case has appeared in the Western Hemisphere while most of the Old World has enjoyed a like immunity. During 1923-27 there were 139 cases in Holland with 41 deaths, as a result of which the law enforcing the vaccination of children was temporarily suspended. In England and Wales there had been 87 cases with 47 deaths, divided between the years 1922-23 and 1926-27. Peculiar is the age incidence, for nearly all cases were in children between 3 and 13 at their first vaccination. Both infants and adults have thus far shown immunity. One might question its

identity with epidemic encephalitis (sleeping sickness); and while in Holland the opinion inclined to identity the reverse was the case in England where the differences were marked. The Commission did not accuse vaccine virus, but believed that the reaction to vaccination rouses some latent organism to activity.

SMART, GEORGE THOMAS. American educator, died at Noroton, Conn., March 13. He was born at Leicester, England, Sept. 21, 1863. He went to the United States in 1881, and in 1888 was ordained in the ministry of the Congregational Church. He served as pastor of churches at West Pawlet, Vt., West Rupert, Vt., Manchester, Vt., and Newton Highlands, Mass., 1888-1921. In the meantime he studied at Harvard University, and was graduated in 1895. From that year on, and after his retirement from the ministry in 1921, he lectured on philosophy, art, and English literature. He delivered lectures at the Andover Theological Seminary and at the Middlebury School of English, 1921. In 1923-24 he traveled abroad, devoting himself to the study of art, and on his return to the United States in 1925 he became acting president of Wheaton College, at Norton, Mass. Dr. Smart, on whom Middlebury College conferred the degree of D.D. in 1900, wrote: *Studies in Conduct* (1905); *The Mystery of Peace* (1909); *The Golden Bond* (1909); *If I Should Meet the Master* (1910); *The Tempter of the American People* (1912).

SMETLING. See METALLURGY.

SMITH, ALEXANDER. Canadian Liberal leader and lawyer, died at Ottawa, Ont., October 17. He was born at Saugeen, Ont., in 1866, and was graduated with honors from the University of Toronto, in 1889. He worked on newspapers and taught school for a time, and he was called to the bar in 1893. Practicing at Toronto and Ottawa, he specialized in parliamentary and departmental agency business. He served as secretary of the Ontario Liberal Association, 1893-1903, and his political activity overshadowed his professional work. He so initiated and developed the organization of the Liberal party in Ontario, as to make it a factor in both Federal and provincial politics. After the Liberals had gained control of the Ontario legislation, and had succeeded in the general election throughout the Dominion in 1904, Mr. Smith devoted himself to law practice in Ottawa.

SMITH, EDGAR FAHS. American chemist and educator, died at Philadelphia, Pa., May 3. He was born at York, Pa., May 23, 1856. He was graduated from Pennsylvania College in 1874 with the degree of B.S., and studied at Göttingen for two years. After serving as instructor in chemistry at the University of Pennsylvania and as professor at Muhlenberg and Wittenberg colleges, he became professor of chemistry at the University of Pennsylvania, and he retained his connection with the institution until his death. From 1899 to 1911 he was vice provost, and was provost from 1911 to 1920, when he retired from active duty, as provost and Blanchard professor of chemistry. He was made professor emeritus of chemistry.

Many honors were awarded to Dr. Smith in recognition of his important original contributions to chemistry, especially in the domain of the use of electrolytic methods for analysis and for determinations of atomic weights. Among his distinctions were membership in the Na-

tional Academy of Sciences and the presidency of the American Philosophical Society and of the American Chemical Society. He was also vice president of the American Association for the Advancement of Science, a member of the Society of the Chemical Industry, and honorary member of the American Electrochemical Society, the Société de Chimie Industrielle de France, and the Chemical, Mining, and Metallurgical Society of South Africa. More than sixteen universities of the United States, Canada, and Europe conferred honorary degrees on Dr. Smith, and he received the Elliott Cresson Medal from the Franklin Institute, the Chandler Medal from Columbia University, and the Priestly Medal from the American Chemical Society. He was made an officer of the Legion of Honor of France in 1923.

In addition to his professional and educational activities, Dr. Smith engaged in public duties. He was a member of the jury of award at the World's Columbian Exposition, Chicago, 1893; a member of the United States Assay Commission, 1895; adviser in chemistry to the Carnegie Institute, 1902; trustee of the Carnegie Foundation, 1914-20; member of the board of technical advisers of the Washington disarmament conference, and member of the electoral college from Pennsylvania. He was beloved by his students, and a leader in movements for their benefit. Dr. Smith was the author or editor of a long list of books dealing with chemistry and electrochemistry and the history of the sciences, including translations of Richter's textbooks on inorganic and organic chemistry. Among his books may be mentioned: *Electro-Chemical Analysis* (5th ed., 1911); *Theories of Chemistry* (1913); *Elements of Electro-Chemistry* (1913); *Chemistry in America* (1914).

SMITH, JAMES FRANCIS. American jurist and public official, died at Washington, June 29. He was born at San Francisco, Calif., Jan. 28, 1859, and was graduated from Santa Clara College, 1878. He then studied law at the Hastings Law School and was admitted to the bar of California in 1881. In April, 1898, on the outbreak of the Spanish-American War, he became colonel of the First California Regiment, United States Volunteers, and in June of the same year went to the Philippines with his men. He served throughout the fighting with the Spaniards and with the Filipinos under Aguinaldo, and was commended for gallantry. He was promoted to brigadier general, United States Volunteers, Apr. 24, 1899, with command of the Department of Visayas. In July, 1899, he became Military Governor of the Island of Negros, and in October, 1900, was placed in charge of the collection of customs of the entire Philippine Archipelago. He left the military service in 1901 to become associate justice of the Supreme Court of the islands, and on Jan. 1, 1903, became a member of the Philippine Commission and Secretary of Public Instruction, serving in those offices until Sept. 20, 1906, when he was appointed Governor-General of the Philippines. In 1909, after ten years of military and civil service in the islands, he resigned as governor-general. In the following year he was appointed associate judge of the United States Court of Appeals, at Washington, D. C., and he served there until his death.

SMITH COLLEGE. A non-sectarian college for women at Northampton, Mass., founded in

1871. The enrollment for the autumn of 1928 was 2103, including: 82 graduate students, 17 non-collegiate students, and 38 juniors studying in France. There were 227 faculty members. The productive funds amounted to \$5,127,523, and the income from the funds to \$288,357. The library contained 154,460 volumes. The William Allan Neilson Chair of Research, established in 1927, was occupied by Dr. Kurt Koffka, formerly professor of psychology at the University of Giesesen, who had 5 assistants. Among the accessions to the Museum of Art during the year were works by Géricault, Delacroix, and Courbet. The music department gave recitals of Handel's *Xerxes* and Monteverdi's *The Combat of Tancredi and Clorinda*, each for the first time in America. A revised curriculum was put into operation, requiring proof before the senior year of ability to read ordinary prose in two foreign languages; substituting for required courses the selection of work in each of four main fields of learning: and opening to freshmen courses in religion, psychology, philosophy, and government. President, William Allan Neilson, Ph.D., LL.D., L.H.D., Litt.D.

SMITHSONIAN INSTITUTION. An organization founded in 1846, according to the terms of the will of James Smithson of England, who, in 1826, bequeathed his property to the United States of America to "found at Washington, under the name of the Smithsonian Institution, an establishment for the increase and diffusion of knowledge among men." In receiving the property and accepting the trust, Congress determined that the Federal Government was without authority to administer the trust directly, and therefore constituted an "establishment" whose statutory members are the President, the Vice President, the Chief Justice, and the heads of the executive departments. The affairs of the Institution are administered by a Board of Regents, whose membership consists of the Vice President, the Chief Justice, three members of the Senate, and three members of the House of Representatives, together with six other persons, other than members of Congress, two to be residents of the City of Washington, and the other four of different States. The Chancellor of the Institution in 1928 was Chief Justice Taft.

The Institution administers the following government bureaus: The National Museum, the National Gallery of Art, the Bureau of American Ethnology, the International Exchange Service, the National Zoological Park, the Astrophysical Observatory, and the United States Regional Bureau of the International Catalogue of Scientific Literature. It also administers the Freer Gallery of Art.

The Institution's researches on the radiation of the sun, under the direction of Dr. C. G. Abbot, were continued during the year at the Astrophysical Observatory at Washington and at the field stations in California, Chile, and Southwest Africa. Many other researches in various phases of geology, biology, anthropology, and astrophysics were carried on under the direction of the Institution.

The institution and the governmental branches under its direction published during 1928 the usual large number of technical papers presenting the results of its researches in many branches of pure science, and there were issued 117 volumes and pamphlets, of which 183,196 copies

were distributed to libraries, educational institutions, and individuals. The unrestricted income of the Institution, averaging about \$65,000, is derived from interest on its endowment funds, which in 1928 amounted to a little over \$1,000,000. It is also charged by Congress with the disbursement of the government appropriations for the support of the bureaus under its administrative charge. Dr. C. G. Abbot was elected secretary on January 10, 1928, to succeed the late Dr. Charles D. Walcott. The assistant secretary was Dr. Alexander Wetmore.

SOCIALISM. UNITED STATES. April saw the launching of the Socialist campaign for the Presidency with the nomination of Norman Thomas of New York for President and James H. Maurer of Pennsylvania for Vice President. The party's platform contained planks calling for the following: Public ownership of all natural resources and public utilities including oil wells, coal mines, power plants, railroads, and telegraph and telephone systems; governmental relief of unemployment by the extension of public works; a shorter work day; a child-labor amendment to the Constitution; the outlawry of war; disarmament; cancellation of war debts; recognition of Russia; withdrawal of marines from Nicaragua; membership in the League of Nations. The convention appealed to organized labor for its support and promised its coöperation to all political groups in sympathy with Socialist principles. Norman Thomas made a spirited campaign, trying to hold particularly those liberal votes that had been cast for La Follette in 1924. He appreciated that Smith was his chief difficulty with the result that he spent most of his time denying that a vote for him would be wasted because Smith's defeat was inevitable.

How true Mr. Thomas' prophecy was the election figures adequately demonstrated; though there can be no doubt that none the less many liberal votes went to Smith that would not have supported another Democratic candidate. The result was that only some 300,000 votes were cast for the Socialist ticket and one-third of these came from the voters of New York State. The Socialist vote was the smallest since 1900 when Eugene Debs polled 94,768 votes. In 1912 Mr. Debs had received 897,011 votes. In addition to the candidacy of Mr. Smith other factors in the small Socialist vote were: the smallness of the fund available for electioneering purposes; the difficulty in reconstruction of the party after the surrender of the standard to La Follette; the general prosperity of the country.

The Workers' (Communist) party, which met in convention May 27, for the purpose of choosing presidential and vice presidential candidates, issued a manifesto in which it declared "its aim was the overthrow of capitalism, the establishment of a workers' and farmers' government, the establishment of a communist society in which the means of production will not be

the property of the few. . . ." The party platform denounced the Republican, Democratic, and Socialist parties. Among other planks were to be found the following: abolition of the Senate; abolition of the Supreme Court and the veto power of the President; immediate recognition of Soviet Russia; a five-year moratorium on farm-mortgage debts; an income tax, graduated from \$5000, that was to confiscate all incomes above \$25,000; shorter hours of labor; a five-day week; repeal of immigration laws; Federal social insurance laws for sickness, accidents, unemployment, and old age; "abolition of the whole system of infamous imperialist peace treaties; cancellation of all debts of the last imperialist World War." William Z. Foster of Pennsylvania was nominated for the presidency and Benjamin Gitlow of New York was nominated for the vice presidency. In 1924, the Workers' party polled 36,386 votes. The 1928 vote was stated by the Associated Press as 48,228.

GREAT BRITAIN. The year saw the continuance of the split in the ranks of the British Labor party. During the summer, the extremists sought to win back British labor and in particular the Trades Union Congress to the Marxian doctrine of the class war and a manifesto signed by James Maxton of the Independent Labor party and A. J. Cook of the Miners' Federation issued a call for conferences to restate the Labor position. Their success was slight however. The extremists could not move the official Labor party; on the other hand, the communists pointed out that radicalism lay in union with the Communist party and the Left Wing movement.

The wish of the majority to part company with the radicals was shown in the election programme of the party issued on July 6. This proclaimed the desire to transform "capitalism into socialism" by peaceful methods. The Labor party was opposed to the reduction of wages; favored the repeal of the Trades Union Act; sought the restoration of the rights of the unions; demanded a 48-hour week; sought the extension of the factory code, the minimum wage, etc.; withdrawal of children under 15 from the factories; nationalization of coal, transport, power and life insurance; transference of all lands to public ownership, giving the farmer easy credits and security of tenure; the regulation of the wages and hours of agricultural laborers; the revolution of the educational system to provide public education from nurseries to the universities. Funds for these reforms were to be secured by an increase of the inheritance tax on large estates, by a readjustment of the income tax, by a surtax on all land revenues of more than £500, and by a reduction on the national expenditure for armaments.

GERMANY. In the National elections held on May 20, a total of 152 Socialist deputies and 54 Communists out of 489 members was elected to the Reichstag. Both radical parties gained heavily at the expense of the Nationalists. The Socialist gain was 18 per cent; the Communist, 25 per cent. Out of the 30,592,444 votes cast, the Social Democrats (Socialists) polled the largest number, receiving 9,000,000; while the Communists came in fourth, after the Nationalists and the Centrists, with 3,080,000 votes. The Social Democratic candidates had run on platform which included the following: loyalty

to the Republic; additional administrative and judicial reforms aiming at greater democratization; more protection for the workers; separation of Church and State; and the socialization of industry. The Communists sought the dictatorship of the proletariat. In Berlin they polled 600,000 votes, or one-fourth of all the ballots cast, an increase of more than 60 per cent over their total of four years ago. These gains were at the expense of the Socialists and the Centrists.

See also AUSTRIA, under *History*.

SOCIAL PROGRESS, INTERNATIONAL ASSOCIATION FOR. This international Association, of which the Association for Labor Legislation is the American section, was created in 1925 by amalgamating three former allied organizations, the International Association for Labor Legislation, the International Association on Unemployment, and the International Social Insurance Committee. Two meetings were held in 1928. At the first, in Paris, June 30, representatives from eight countries, including the United States, gave reports on the work of their national sections. At the second meeting, in Geneva, September 23-25, a report on the extension of elementary-school education was made by the special International Technical Committee, and a questionnaire was formulated on labor regulation and unemployment. Another question put on the agenda for international consideration was that of Travelers Migrations. Reports on these subjects from the various sections were to be made in advance of the General Assembly of the Association in the summer of 1929. The Association publishes a periodical, *L'Avenir du Travail*, edited by Dr. Stephane Bauer, at the international headquarters at Basle, Switzerland.

SOILS. Land reclamation, soil erosion, fertilizing value of minor constituents of the soil, and soil acidity were among the topics which were receiving special consideration by soil investigators.

The trend in the United States toward more discriminating use of soils continued unabated, and the bringing of new land under cultivation was being discouraged. Ray Palmer Teele, in a recent book, *Economics of Land Reclamation*, urged caution in reclaiming new land until fuller and better use was made of the potentially valuable lands already available, which could be more economically used for crop production. There appeared to be a growing opposition to large expenditures of public funds for the purpose of adding to the cultivated areas until the need for more land is clearly shown. Baker states (*Geographical Review*, vol. 18, No. 3, p. 353) that population is not likely to press against the limits of subsistence in the United States for a long time, if ever. Food production, in his opinion, would probably keep pace with the growth of population, at least to the 200,000,000 mark, as a result of constantly improving methods of soil culture. McCall stated (*Journal of the American Society of Agronomy*, vol. xx, No. 12, p. 1241) at a meeting of the American Society of Agronomy that economic conditions called for

a contraction of acreage under cultivation and the elimination of marginal lands from farming for the present. As a matter of fact, since the World War more than 15,000,000 acres of less productive lands had passed out of cultivation in the United States.

The soil survey furnishes a valuable means of selecting the more profitably productive soils. It makes possible the differentiation of agricultural and non-agricultural lands and the selection of those best adapted to special crops and intensive culture. Activity in soil survey and mapping was world-wide. The United States continued to lead in such work, and since 1899 the Department of Agriculture had surveyed and mapped more than 800,000,000 acres, or approximately one-half of the arable land of the country. During 1928 areas aggregating 21,833 square miles were surveyed and mapped in detail and reconnaissance surveys were made of 17,585 square miles. To make these surveys still more valuable from the standpoint of efficient soil culture, it was proposed to supplement them with ecological and plant-adaptation studies.

Widespread interest was aroused in the enormous wastes of soil fertility due to erosion. Losses from this cause were shown to be immensely greater than those resulting from the leaching of the soil and the removal of crops. The United States Department of Agriculture, with the coöperation of the States, was making an active effort to determine the kinds of soils most subject to destructive erosion and the best means of preventing it. Exact measurements of erosion under different conditions had shown the great advantage of terracing or keeping land covered with plant growth, especially sod. The extent of damage already caused by erosion was shown by the fact that 15,000,000 acres of tillable land in the United States had thus been made permanently unproductive and that the damage was steadily increasing. The subject is fully discussed in *Circular 33* of the United States Department of Agriculture, entitled "Soil Erosion—A National Menace," and was also dealt with in a symposium presented at the annual meeting of the American Society of Agronomy.

Evidence continued to accumulate that certain of the less abundant constituents of soils, like manganese, copper, iodine, and others, play a more important part in plant nutrition and in the food and forage value of products of the soil than is generally realized. The addition of small amounts of these substances has been shown to result in marked increases in the productivity of certain soils. The question of the iodine content of soils and of plants grown on them and the possibility of increasing this content was attracting much attention because of the known value of iodine in connection with goitre and similar disorders. Evidence has been obtained that the iodine content of plants varies with that of the soil (and waters) of the region in which they are grown and may probably be increased by iodine fertilizing.

The relation of soil acidity to crop production continued to receive much attention. From a study of the relation of soil acidity to distribution and growth of plants, the North Carolina Experiment Station has worked out the following rough classification of crops with reference to their adaptation to soil reaction: Crops requiring neutral soil, alfalfa, barley, cabbage, red clover, lettuce, mint, spinach, peanuts, and cantaloupes;

crops adapted to slightly acid soil, cowpeas, oats, velvet beans, soy beans, corn, wheat, vetch, and Lespedeza; crops adapted to medium acid soil, sweet potatoes, rye, cotton, tobacco, blue grass, and redtop grass; and crops adapted to strongly acid soil, strawberries, watermelons, and Irish potatoes.

A notable contribution to the literature of soils during the year was the *Proceedings of the First International Congress of Soil Science* (held in Washington in 1927), which presents an epitome of soil investigation throughout the world. Another publication of special interest was a report, *The Soils of Cuba*, by H. H. Bennett and R. V. Allison, issued by the Tropical Plant Research Foundation.

SOLAR PHYSICS. See ASTRONOMY; GEOGRAPHICAL SOCIETY, NATIONAL.

SOMALI COAST. See FRENCH SOMALI COAST.

SOMALILAND, ITALIAN. See ITALIAN SOMALILAND.

SOMALILAND, sō-mă'lē-lānd, PROTECTORATE. A protectorate on the Gulf of Aden belonging to Great Britain bounded by Italian Somaliland, Abyssinia, and the French Somali coast. Area, about 68,000 square miles; population estimated at 344,700, nearly all Mohammedan and entirely nomadic except on the coast where permanent settlements have been made. The chief town is Berbera, with 30,000 inhabitants at the census of 1921. Other towns are Lulhar, with 7300, and Zeyla, with 7000. The main source of wealth in the interior is stock raising. The principal imports are dates, sugar, textiles, rice, and specie, and the principal exports are hides and skins, gums and resins, cattle and sheep, and glue. The only forms of transport are by camel and motor car. In 1926 the imports were £307,423; exports, £205,301; revenue £89,057; expenditure, £167,955. The government is under the British Colonial Office, which is represented by a local governor and commander-in-chief. Governor in 1928, H. B. Kittermaster, appointed Jan. 26, 1926.

SONG RECITALS. See MUSIC.

SONNECK, OSCAR GEORGE THEODORE. An eminent American musicologist, died in New York, October 29. He was born in Jersey City, N. J., Oct. 6, 1873. At the age of ten he was taken to Germany, where he received a thorough academic education at the Gelehrtenschul in Kiel (1883-89) and at the Kaiser Friedrich Gymnasium in Frankfort-on-Main (1889-93). In the latter city he completed his pianistic studies under James Kwast. From 1893-97 he was at the University of Munich, studying musicology under Sandberger and philosophy under Stumpff. He then returned for one year to Frankfort for private study in composition with M. E. Sachs and instrumentation with Ivan Knorr. After spending the greater part of 1899 in Italy in musical research, he returned to the United States, continuing his research work in the libraries of the principal cities. In 1902 he was appointed chief of the music section of the Library of Congress, which position he resigned in 1917 to become director of the publication department of G. Schirmer, Inc., in New York. In 1921 he became its vice president. From 1915 until his death he was editor of *The Musical Quarterly*. Besides, he was secretary of the Beethoven Association, executive member of the Society for the Publication of American

Music and president of the American section of the International Society for Contemporary Music. In 1911 he represented the United States Government at the international congresses of music in London and in Rome, and in 1927 at the Beethoven Centennial in Vienna.

Perhaps Sonneck's most important work was done while at the Library of Congress. When he assumed charge, the music section was little more than an accumulation of copyright material; when he resigned, he had succeeded in making it one of the foremost musical libraries in the world, the printed catalogue of July 1, 1917, listing 797,121 titles. During those years he availed himself to the fullest extent of the unusual opportunities afforded for original research, the results of which he published in a number of books exhibiting profound and accurate scholarship. Thus he laid a real foundation for the scientific study of music in the United States. His elaborate catalogues, issued by the Library of Congress, are among the most valuable contributions to musical bibliography. His principal works are *Francis Hopkinson and James Lyon, Two Studies in Early American Music* (1905); *Early Concert Life in America [1731-1800]* (1907); *Report on the Star-Spangled Banner, Hail Columbia, Yankee Doodle* (1909); *A Survey of Music in America* (1913); *The Star-Spangled Banner* (1914); *Early Opera in America* (1915); *Sum Cuique*, a collection of essays (1916); *Miscellaneous Studies in the History of Music* (1921); *Beethoven: Impressions of Contemporaries* (1927); *Beethoven Letters in America* (1927); *The Riddle of the Immortal Beloved* (1927).

SORGE, sörg, KURT OSCAR. German industrial leader, died at Berlin, September 10. He was born at Zwickau, July 28, 1855, and he studied at the Academy of Mines, Freiberg, 1873-77. After working as a mining engineer in Germany and in the United States for several years, he joined the Krupp works at Essen, in 1893, becoming head director in 1899. During the World War he served as chief technician in the German War Office, from Nov. 16, 1916, until Oct. 1, 1918. After the War, Dr. Sorge was one of President Ebert's principal advisers in industrial matters and as president of the Association of German Industries, 1919-24, he urged upon the Government the necessity of leaving capital free to develop industrial production. He was elected to the Reichstag by the popular party in 1920, and he advocated the acceptance of the Dawes reparation plan in 1926, constantly insisting that business should not be restricted.

SORLIE, sör'lē, ARTHUR GUSTAV. Governor of North Dakota, died at Bismarck, N. D., August 28. He was born of Norwegian parents at Albert Lea, Minn., Apr. 26, 1874, and attended the Albert Lea Lutheran Academy for three years. He moved to North Dakota and worked as a clerk in the Buxton State Bank, and three years later he became manager of a general store. After various commercial positions in St. Paul, Minn., and Grand Forks, N. D., in 1907 he organized and became president of A. G. Sorlie & Co., a grain concern in the latter city. Later he was president of the Sorlie Motor Company, in Larimore, N. D., the Webster-Sorlie Company, in Fisher, Minn., and the Jefferson Motor Company, in Albert Lea, Minn., and vice president of the State Bank of Douglas, N. D. He was elected Governor of North Dakota in 1924 on the Nonpartisan League ticket,

defeating the Republican candidate by a narrow margin. In 1926 he was reelected, but he was not a candidate in 1928, acting, however, in that year as chairman of the North Dakota delegation to the Republican National Convention.

SOUTH, UNIVERSITY OF THE. A Protestant Episcopal institution for the higher education of men at Sewanee, Tenn., founded in 1857. The enrollment for the autumn term of 1928 was 345, of whom 322 were registered in the college and 27 in the theological school, 4 being registered in both departments. There were 40 students in the summer quarter, 28 of whom returned for the autumn session. The faculty had 28 members, exclusive of student assistants. The income from productive funds was \$58,000, while the receipts from all sources totaled \$341,000. The library contained 42,387 volumes. President, Benjamin Ficklin Finney, LL.D.

SOUTH AFRICA, UNION OF. A self-governing dominion of the British Empire, comprising the provinces of the Cape of Good Hope, the Transvaal, Natal, and the Orange Free State; constituted a legislative union by the South African Act of September, 1909.

AREA AND POPULATION. Total area, 472,347 square miles; divided as follows: Cape of Good Hope, 276,966; Natal, 35,284; Transvaal 110,450; Orange Free State, 49,647. Total population, according to the census of 1921, 6,928,580, distributed as follows: Cape of Good Hope, 2,782,719; Natal, 1,429,398; Transvaal, 2,087,636; Orange Free State, 628,827. The total European population of the Union of South Africa, according to the final audit of the 1926 census, is shown in the following table:

CENSUS OF UNION OF SOUTH AFRICA FOR 1926

Province	Males	Females	Total	Per cent increase since 1921
Cape	357,583	348,554	706,137	8.53
Natal	81,170	77,746	158,916	16.13
Transvaal	318,783	294,849	608,622	11.99
Orange Free State	104,992	98,593	202,985	7.65
Total	856,918	819,742	1,676,660	10.34

The principal cities with their populations according to the census of 1921 were: Johannesburg, 288,131; Cape Town, the seat of the legislature, 207,404; Durban, 146,310; Pretoria, 74,052; Port Elizabeth, 46,094; East London, 34,673. The capitals of the respective provinces are Cape of Good Hope, Cape Town; Transvaal, Pretoria; Natal, Pietermaritzburg; Orange Free State, Bloemfontein. The movement of population in 1926 was: Births, 97,224; deaths, 57,793; marriages, 31,998. For a distribution of population by religion according to the census of 1921, see YEAR BOOK for 1924.

EDUCATION. There were in 1926, 4707 State and State-aided schools for European scholars, 330,762 pupils and 3408 schools for non-European scholars with 289,545 pupils, making a total of 8115 schools with 620,307 pupils. The number of teachers in primary, intermediate, and secondary schools numbered 22,274. There were 289 private schools for European scholars and 469 for non-European scholars, with 20,132 white scholars and 20,146 colored, and 1817 teachers. The total number of students enrolled in the universities and colleges at the end of 1926 was 6158. The largest universities in point of number of students, with their average enrollment at the

end of 1926, were, Cape Town, 1663; Witwatersrand, 1347; Stellenbosch, 968; and Transvaal University College, 784.

PRODUCTION. ETC. The production of the principal crops in 1926 was as follows: Wheat, 552,578,000 lbs.; barley, 53,332,000 lbs.; oats, 175,521,000 lbs.; kaffir corn, 150,548,000 lbs.; maize, 2,183,983,000 lbs.; potatoes, 202,890,000 lbs.; cotton (not ginned), 24,936,775 lbs.; tobacco, 16,516,000 lbs.; tea, 4,146,000 lbs.; sugar cane, 2,311,293 tons. The 1926 census of livestock showed 10,337,174 cattle; 856,040 horses; 126,909 mules; 755,280 asses; 908,964 pigs; 35,269,228 woolled sheep; 3,589,549 other sheep; 1,825,189 Angora goats; 6,122,097 other goats; and 103,668 ostriches. The production of wool in 1928 was 285,000,000 pounds and of mohair 8,250,000 pounds.

The value of the mineral production for 1927 in the Union of South Africa was \$297,704,000 to which gold contributed \$209,248,000, diamonds, \$61,540,000, and coal, \$18,665,000. The production of the more important minerals was as follows: Asbestos, 22,043 short tons; coal, 13,306,000 short tons; copper, 10,741 short tons; diamonds, 4,708,000 carats; gold, 10,122,000 fine ounces; silver, 1,012,000 fine ounces; tin concentrates, 1929 short tons. In 1928 the production of coal was 13,388,000 tons. The diamond situation in the Union was so demoralized in 1927 by the alluvial discoveries in the western Transvaal that governmental intervention became necessary. In addition, the diamond syndicate purchased and took off the market \$50,000,000 worth of stones, significant since the annual amount of world consumption is estimated at approximately \$75,000,000. The large production of inferior grades has had an adverse effect on the industry in general, and particularly upon the big companies, reducing both dividends and the scale of operations. To meet the situation, the comprehensive Alluvial Diamond Act was passed in October, 1927, curbing the alluvial production at once and giving the Government broad powers of restriction and regulation of output.

The industrial census of 1925-26 gave the following data: Number of workers, 193,422, of whom, 48,879 were in the metal industry, 34,050 in foodstuffs and drinks, 28,960 in building, 8604 in light, heat, and power, and 14,370 in stone and clay; value of gross output, \$443,909,000, of which metals and machinery contributed \$90,928,000; food and drink, \$141,964,000; chemicals \$31,289,000; heat, light, and power, \$24,063,000; building and contracting, \$42,588,000. The capacity of the prime movers was 937,726 horse power.

COMMERCE. The accompanying table from the *Commerce Year Book* for 1928 give statistics for the trade of the Union of South Africa.

FINANCE. Revenue of £30,073,000 for the fiscal year ended Mar. 31, 1928, and expenditure of £28,478,000 provided the fifth consecutive surplus in the ordinary Union budget. Customs duties were exceptionally heavy, but all classes of revenue were in excess of estimates except taxes on diamond-mining companies. Of the surplus, £500,000 was applied on debt redemption and the remainder to a rebate of 20 per cent in the year's income taxes. The total debt redemption was £1,535,000. The separate railways and harbors budget for the fiscal year 1927-28 showed a net profit of £47,000, with expenditures of £29,364,000. The Union also maintains a separate capital loan account, expenditures from which were £11,000,000, largely for railway and public improve-

ments and covered mainly by an issue of 5 per cent stock to the amount of £5,000,000, maturing in 1945-75 in London, and a local loan for a like amount. The gross public debt on Mar. 31, 1927, was £231,475,948 and the net debt £216,397,410.

GENERAL IMPORTS BY PRINCIPAL COMMODITIES

Commodity	Value (\$1000) 1927
Total imports	359,497
On private account	343,471
From overseas	328,083
Wheat	6,685
Raw coffee	4,451
Tea	4,450
Alcoholic beverages	3,007
Leather footwear	3,989
Cotton piece goods	17,956
Jute bags	4,686
Blankets, rugs, and kafir sheets	6,000
Woolen piece goods	6,407
Silk piece goods	5,338
Apparel (outer)	15,126
Hosiery	3,559
Underclothing	5,606
Wood, wicker, and manufactures	13,797
Mineral oil	11,524
Gasoline, etc.	6,517
Sheet iron, galvanized and corrugated	3,998
Iron and steel pipes and tubes	4,821
Iron and steel wire	4,748
Electrical machinery, etc.	11,809
Agricultural implements and machinery	4,920
Mining machinery	4,999
Passenger motor cars and chassis	16,387
Gold and silver bullion	236
From other States in the South African Customs Union	15,438
For Government use	16,026
Specie *	285

DOMESTIC EXPORTS OF PRINCIPAL COMMODITIES

Commodity	Value (\$1000) 1927
Total domestic exports	361,060
Overseas	350,473
Corn (maize) ..1000 bushels..	8,058
Corn meal	742,885
Sugar	120,304
Hides and skins	13,083
Sheep skins	8,755
Ostrich feathers ..1000 pounds	97
Angora hair	10,681
Sheep's wool	260,334
In the grease	253,866
Wattle bark	210,569
Cargo coal	1,611
Diamonds	4,274
Gold bars ..1000 fine ounces..	6,448
To other States in the South African Customs Union	10,758
Specie *	79,778

* Not included in totals.

COMMUNICATION. In oversea shipping in 1926, 1321 vessels of 4,937,406 tons net entered the ports of the Union of South Africa and 1303 of 4,945,337 tons cleared; in the coastwise trade 3667 vessels of 8,941,822 tons entered and 3684 of 8,982,837 tons cleared. The length of railway line open to traffic in 1927 was 12,624 miles. For operating figures, etc., consult the 1927 YEAR BOOK. The 1927-28 programme of the South African Railway equipment orders for 165 locomotives was completed when the contract for the last 36 locomotives was awarded to the Swiss Locomotive Co., at a price of £200,730. The conditions of the contract provided for delivery in 32 to 48 weeks. This was the first order for the South African Railways that Switzerland has received.

GOVERNMENT. The executive power is vested in the governor-general, appointed by the Crown,

who acts through an executive council of ministers, each in charge of a department; and legislative power in a parliament, consisting of a senate of 40 members, of whom eight are nominated by the governor-general-in-council and 32 by the provinces (eight each); and a house of assembly of 135 members, distributed among the provinces as follows: Cape of Good Hope, 51; Transvaal, 50; Natal, 17; and Orange Free State, 17; the basis of suffrage being the same as that existing in each province at the time of the formation of the Union. The governor-general, commander-in-chief, and high commissioner for the Union in 1928 was the Earl of Athlone and the executive council was composed as follows: Prime Minister and Minister of Native Affairs, General J. B. M. Hertzog; Interior, Health, and Education, Dr. D. F. Malan; Mines and Industries, F. W. Beyers; Railways and Harbors, C. W. Malan; Finance, N. C. Havenga; Justice, T. J. de V. Roos; Defense, Col. F. H. P. Creswell; Labor, T. Boydell; Agriculture, Gen. J. C. G. Kemp; Lands, P. G. W. Grobler; Posts and Telegraphs and Public Works, W. B. Madeley.

HISTORY. As noted in the previous YEAR BOOK, the troublesome question of the South African flag was definitely settled. On the first of June, 1928, the ceremony of hoisting the new flag took place all over the Union. There was considerable rioting in some parts of the country, chiefly among the natives and colored people who were opposed to the new flag, apparently because of the relatively low position granted them in the affairs of the Union.

In November, there was a cabinet crisis brought about over the question of native and white labor unions. The natives in recent years had been organizing on a large scale and their organization, known as the Industrial and Commercial Workers' Union, had a membership of more than 100,000 in 1928. The native union was affiliated with the International Federation of Trade Unions, while the white labor organization, known as the South African Trades Union Congress, was not connected with any international organization. The natives and whites simply do not mix in any way in the Union of South Africa, and when a member of Premier Hertzog's cabinet received a delegation of postal workers representing both branches of labor, the Premier requested the resignation of the cabinet member, W. B. Madeley, Minister of Posts and Telegraphs. When the minister refused to resign, General Hertzog handed in the resignation of the entire cabinet. He was immediately requested to form a new one and did so leaving out the name of Mr. Madeley, who was succeeded by W. H. Sampson, known as a supporter of the white labor element. It was felt in many quarters that this trouble between white and black labor would have a predominant effect on the next election in the Union, the Nationalists championing the cause of "White South Africa" and the Labor party championing the cause of all labor, although few expected the white and black elements of the labor movement to be treated the same if the Labor party were successful.

See also **PHILOLOGY, MODERN.**

SOUTH AMERICA. See under the various South American countries. See also **EXPLORATIONS.**

SOUTH AUSTRALIA. One of the States of the Australian Commonwealth, comprising the central and southern part of the island conti-

nent; bounded by the Northern Territory on the north, by Western Australia on the west, and on the east by Victoria, New South Wales, and Queensland. Area, 380,070 square miles; population, according to the census of 1921, 495,336; estimated on June 30, 1927, 570,900, exclusive of aborigines, of whom the number is unknown. The number of full-blooded natives living in the settled portions has been estimated at only 2531. Capital and largest city, Adelaide, with a population (including suburbs), in 1926, of 316,865. In 1926 the movement of population was: Births, 11,483; deaths, 4877; marriages, 4503.

Education is free, secular, and compulsory. In 1926 there were 1030 schools, primary, secondary, and vocational, with 84,889 pupils under instruction; in the 184 private schools there were 14,990 pupils enrolled. For higher education there is the University of Adelaide, and there are various institutions for the training of teachers and for technical instruction. In 1926-27 the principal crops with their acreage and production were as follows: Wheat, 2,768,403 acres, 35,558,711 bushels; barley, 256,528 acres, 4,470,034 bushels; oats, 152,178 acres, 1,713,377 bushels; hay, 496,105 acres, 598,025 tons; the vineyards produced 16,159,595 gallons of wine. The principal minerals produced are iron, gypsum, salt, phosphate rock, and copper. The value of the minerals produced in 1926 was £1,032,353. The exports in 1926-27 amounted to £17,123,012 and the imports to £15,454,801. The chief exports are wool, wheat, wheat-flour, copper and other minerals, meats, butter, honey, wine, fruits, hides and skins, tallow, leather, and manures. The revenue for 1927 was £10,784,898 and the expenditure £11,834,947. The revenue is largely derived from inland sources—railways and territorial receipts—and the chief items of expenditure are public service, railways, and service on the public debt, which amounted to £82,638,849 on June 30, 1927. In 1925-26, 1296 vessels of 4,525,679 tons entered the ports of South Australia. In 1927 there were 3400 miles of railway in the State.

The administration is under a governor appointed by the Crown, with an executive council; legislative power is vested in a council and an assembly, the latter consisting of 46 members elected for three years. Governor in 1928, Col. Sir Alexander G. A. Hore-Ruthven (appointed in January, 1928); Premier, Treasurer, and Minister of Railways, R. L. Butler.

SOUTH CAROLINA. POPULATION. According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 1,683,724. The estimated population on July 1, 1928, was 1,864,000. The capital is Columbia.

Crop	Year	Acreage	Prod. bu.	Value
Cotton	1928	2,355,000	725,000 ^a	\$66,700,000
	1927	2,356,000	730,000 ^a	71,540,000
Corn	1928	1,422,000	17,064,000	18,088,000
	1927	1,497,000	25,449,000	22,804,000

	1927	449,000	10,327,000	7,745,000
Potatoes	1928	36,000	4,068,000	2,644,000
	1927	29,000	3,034,000	5,765,000
Sweet potatoes	1928	49,000	4,214,000	3,582,000
	1927	53,000	5,800,000	4,240,000
Hay	1928	440,000	380,000 ^c	7,016,000
	1927	444,000	355,000 ^c	6,382,000
Wheat	1928	64,000	800,000	1,288,000
	1927	80,000	880,000	1,338,000

^a bales, ^b pounds, ^c tons.

AGRICULTURE. The preceding table gives the acreage, production, and value of the principal crops, in 1927 and 1928.

MINERAL PRODUCTION. The mineral industry of the State consisted, in 1926, almost entirely of the output of clay and its products and that of stone, sand, and gravel. Clay products, the largest single item with regard to value produced, attained \$1,869,420 for 1926, as against \$1,906,241 for 1925. The production of stone was 881,180 short tons in 1926, and in 1925, 833,100; in value, \$1,505,859 for 1926 and \$1,315,613 for 1925. Gold production was trifling—but 15 ounces in 1926; some marl, mica, and barite were obtained; no production of phosphate rock in 1926 was reported. The total value of the State's mineral products for 1926 was \$3,677,209; for 1925, \$3,507,804.

FINANCE. State expenditures in the year ended Dec. 31, 1927, as reported by the U. S. Department of Commerce, were: for maintenance and operation of governmental departments, \$12,815,410 (of which \$3,737,384 was aid to local education); for interest on debt, \$401,366; for permanent improvements, \$9,819,582; total, \$23,036,358 (of which \$10,564,098 was for highways, \$1,966,769 being for maintenance and \$8,597,329 for construction). Revenues were \$17,464,224. Of this, property and special taxes formed 32.8 per cent; departmental earnings and charges for officials' services, 7.5 per cent; sales of licenses and taxes on tobacco in various forms, soft drinks and gasoline, 48.1 per cent. Property valuation was \$422,169,895; State taxation thereon, \$2,894,979. Net State funded debt on Dec. 31, 1927, was \$29,566,742, chiefly in the form of highway bonds.

TRANSPORTATION. The total number of miles of railroad line under operation on Jan. 1, 1928, was 3744.46. There were built in 1928 three miles of additional first track.

EDUCATION. State Superintendent Hope, in the *Journal of the National Education Association*, stated that the yearly average school term for accredited high schools had extended to 172 days. There were in 1926, 296 high schools, which awarded, in that year, 3966 diplomas. It was reported that there were in 1926 nearly 50 per cent more first-grade certified teachers than the number required to fill the 8618 teaching positions in the white schools of the State.

CHARITIES AND CORRECTIONS. The central State authority over the greater part of the State correctional and eleemosynary institutions was exercised in 1928 by the State Board of Public Welfare, created in 1920. This board consisted of the Governor, as ex-officio chairman, and six appointee members. It controlled several State training and reformatory schools, exercising parole power over delinquent inmates; supervised orphanages, county jails, almshouses, and the State Penitentiary and State Hospital; passed upon applications for charitable charter or license; cooperated in parole of adult prisoners; and supervised State work for the blind. A Child Placing Bureau aided needy children in various ways. Under the State Board of Health were two institutions for tuberculosis patients, at State Park: The South Carolina Sanatorium (white), and the Palmetto Sanatorium (colored). Apart from these the chief State institutions were: Industrial School for Boys, Industrial School for Girls, State Reformatory for Negro Boys, State Training School (for the feeble-

minded), State Hospital, Confederate Infirmary, and State Penitentiary. The number of the feeble-minded at the State Training School at the outset of 1928 was 437. The South Carolina penitentiary had a total of 273 prisoners received from the courts in 1928 or 14.8 per 100,000 of general population. There were on Jan. 1, 1928, 447 prisoners.

LEGISLATION. The State Legislature met in regular annual session January 10. It passed an appropriation measure of somewhat over \$10,243,000. Various plans for increasing the State revenue so as to check the State treasury deficit were considered. An act for the regulation of highway traffic was passed, with the requirement that all vehicles coming to those State highways denominated express highways, from transverse roads must make a full stop before entering them. An anti-evolution bill was presented but was killed in committee.

POLITICAL AND OTHER EVENTS. Efforts to enforce the State blue laws, undertaken in the previous year with the support of the Governor, led to the rendering of a State Supreme Court decision on the subject of injunctions that had been granted against State law officials, to restrain them from interfering with the playing of golf and with the sale of gasoline on Sundays. The decision held that the playing of non-commercial golf was not unlawful and that caddies might be used provided that they were not under the age of fifteen years. The Sunday sale of gasoline was pronounced lawful only when it could be proved a work of necessity or of mercy. Serious floods occurred in the Piedmont region early in August.

ELECTION. As in other Southern States, an effort was made in the Presidential campaign to influence the voters to bolt the Democratic Presidential candidate, Alfred E. Smith. In opposition to these efforts was cited Rule 32, a regulation adopted by the Democratic State Convention of 1914, which made it obligatory for members of the party to agree to support its candidates, "State and National" as a condition to their privilege of voting at the State primaries. The rule was construed as a moral obligation, rather than as legally enforceable, but exerted an influence in maintaining party solidarity. The vote of the State was for Smith and Robinson by an overwhelming majority, no considerable Republican vote being cast. The State's delegation of seven United States Representatives, all Democratic, were reelected. Smith (Democrat) for President received 62,700 votes; Hoover (Republican), 3188.

OFFICERS. Governor, John G. Richards; Lieutenant-Governor, Thomas B. Butler; Secretary of State, W. P. Blackwell; Treasurer, J. H. Scarborough, Budget Secretary, Walter E. Duncan; Attorney-General, John M. Daniel; Comptroller-General, A. J. Beattie.

JUDICIARY. Supreme Court: Chief Justice, R. C. Watts; Associate Justices, Thomas P. Cothran, John G. Stabler, Eugene S. Blease, Jesse F. Carter.

SOUTH CAROLINA, UNIVERSITY OF. A non-sectarian State institution of higher education, at Columbia; chartered in 1801 and opened in 1805. The enrollment for the autumn session of 1928 totaled 1475, of whom 947 were men and 528 women. The registration for the summer session was 479. The faculty, including instructors, numbered 82. The appropriation by the General

Assembly of the State of South Carolina was \$426,577 for the fiscal year. There were 82,000 volumes in the library. Additions to the physical plant during the year included: the construction of two commodious wings of the University library; the gift of Melton Observatory from the Hon. Edwin G. Seibels; and the opening of Sloan College, an engineering class-room building. President, Davison McDowell Douglas, A.M., D.D., LL.D.

SOUTH DAKOTA. POPULATION. The fourth State census of South Dakota was taken as of May 1, 1925, and showed a total population of 681,260, of which 20,559 were Indians. Of this total 347,579 were males and 313,122 were females. The Fourteenth Census of the United States, returned for South Dakota 636,547 on Jan. 1, 1920. The estimated population on July 1, 1928, was 704,000. The capital is Pierre.

AGRICULTURE. The following table gives the acreage, production, and value of the principal crops in 1927 and 1928:

Crop	Year	Acreage	Prod. bu.	Value
Corn	1928	4,469,000	93,849,000	\$58,186,000
	1927	4,655,000	134,995,000	76,947,000
Wheat	1928	3,262,000	34,546,000	29,320,000
	1927	3,037,000	45,386,000	47,990,000
Hay	1928	3,193,000	2,919,000 *	21,787,000
	1927	4,115,000	5,532,000 *	35,139,000
Oats	1928	2,193,000	59,211,000	19,540,000
	1927	2,550,000	74,715,000	26,897,000
Barley	1928	1,644,000	35,675,000	17,124,000
	1927	1,200,000	36,000,000	20,880,000
Flaxseed	1928	588,000	3,410,000	6,854,000
	1927	594,000	5,940,000	10,989,000
Potatoes	1928	67,000	6,030,000	2,412,000
	1927	60,000	6,900,000	3,795,000
Rye	1928	162,000	1,458,000	1,152,000
	1927	154,000	2,772,000	2,190,000

* tons.

MINERAL PRODUCTION. The large gold production of the State, principally the output of the Homestake Mine, continued to form the chief part of the mineral output. The quantity of gold mined in the State rose to 322,681 troy ounces for 1927, from 286,861, for 1925. The 1927 production surpassed that of Alaska and was second to that of California alone, in the Union. Its total value for 1927 was \$6,670,400; for 1926, \$5,932,000. Silver production was secondary, being 95,123 troy ounces in 1927 and 82,789 in 1926; in value \$53,935 for 1927 and for 1926, \$51,660. The yearly coal production has run about \$42,000 in value. Of tungsten ore there were mined in 1926, 90 tons, of a total value of \$41,900. Stone was produced to a value of over \$450,000, sand and gravel over \$250,000. The total value of the State's mineral products for 1926 was \$7,595,358; for 1925, \$7,971,650. The 1928 production of the precious metals was reported as: gold, \$6,615,000; silver, 89,000 ounces.

FINANCE. State expenditures in the year ended June 30, 1927, as reported by the United States Department of Commerce, were: for maintenance and operation of governmental departments, \$9,110,066 (of which \$1,813,212 was aid to local education); for conducting public-service enterprises, \$543,382; for interest on debt, \$3,104,713; for permanent improvements, \$3,629,526; total, \$16,387,688 (of which \$4,016,341 was for highways, \$1,169,244 being for maintenance and \$2,847,097 for construction). Revenues were \$16,338,291. Of this, property and special taxes formed 30.4 per cent; departmental earnings and charges for officials' services, 7.5 per cent; sales of licenses and taxation of gasoline, 25.5 per cent. Property

valuation was \$1,805,466,033; State taxation thereon, \$4,807,950. Net State funded debt on June 30, 1927, was \$15,014,772.

TRANSPORTATION. The total number of miles of railroad line under operation on Jan. 1, 1928, was 4234.79. No building of additional railroad trackage in 1928 was reported.

EDUCATION. It was reported in 1928 that over 50 per cent of the enrollment in the high schools in South Dakota was made up of pupils residing in the rural districts. Enrollment for the State as a whole was stated to be on the increase both in 1927 and in 1928, and in the elementary grades as well as in the secondary; a development to which the somewhat improved economic conditions within the State were favorable. The school population of the State as given for 1928 was 209,101. There were enrolled in the public schools 171,883 pupils, of whom 143,097 were in the elementary schools and 28,786 were in the high schools. Expenditures of the year for education in the public schools amounted to \$18,473,929. The salaries of teachers averaged \$1193.15 per annum.

CHARITIES AND CORRECTIONS. The chief central administrative authority over State institutions for the care or custody of individuals, in 1928, was the State Board of Charities and Corrections, one of the three constitutional boards of the Government. Another of the constitutional boards, the State Pardon Board, consisting of the presiding judge of the State Supreme Court, the Secretary of State and the Attorney-General, exercised powers elsewhere vested in the Executive, with regard to pardons. A statutory Parole Department headed by a State parole officer conducted the parole system. There were at the same time separate commissions for the administration of child-welfare activities and for the control of the feeble-minded. The State beneficent and custodial institutions were: School and Home for the Feeble-Minded, Redfield; School for the Deaf, Sioux Falls; School for the Blind, Gary; State Training School, Plankinton; State Penitentiary, Sioux Falls; Tuberculosis Sanatorium, Custer; Hospital for the Insane, Yankton; Soldiers' Home, Hot Springs. The State Penitentiary received 236 prisoners in 1927 and had in custody 420 persons at the outset of 1928. Their number in proportion to the population of the State was not quite 60 to the 100,000, and was below that for the two years immediately previous, but considerably above that for 1910.

POLITICAL AND OTHER EVENTS. The State Rural Credit Board made public in April a statement of the finances of the State's effort in the course of several years to extend public credit to the farmers. It was reported that the books of the board showed outstanding farm loans to a total of about \$45,000,000. Of this amount \$29,000,000 was rated as having its interest charges met by the debtors; \$16,000,000 was in default or in arrears, of which a considerable part was involved in foreclosure. Counting foreclosed properties at full value, the report indicated a capital deficit of \$5,344,000; and in addition an operating deficit of more than \$700,000 a year. In order to meet this deficit, a special property tax to yield about \$1,000,000 a year was levied by the board. A South Dakota corporation, the Mound City & Eastern Railway Company, gained permission of the Interstate Commerce Commission to build from Mound City to Leola a railroad line 70 miles in length.

ELECTION. In the election of November 6, the popular vote of the State went to Hoover, the Republican presidential candidate, who received 157,603 ballots. Smith (Democrat) received 102,660. Smith apparently received most of the LaFollette vote of 1924. William J. Bulow, Democrat, was reelected governor. The three United States Representatives, all Republican, were reelected.

OFFICERS. Governor, W. J. Bulow; Lieutenant-Governor, H. E. Covey; Secretary of State, Gladys Pyle; Treasurer, A. J. Moodie; Auditor, E. A. Jones; Attorney-General, Buell F. Jones.

JUDICIARY. Supreme Court: Presiding Judge, N. D. Burch; Judges, Dwight Campbell, Samuel C. Pollev, James Brown, Carl G. Sherwood.

SOUTH DAKOTA, UNIVERSITY OF. A State institution of higher education at Vermillion founded in 1882. The enrollment for the autumn term of 1928 was 1227, and for the summer session, 254. The faculty and staff numbered 135. The productive funds amounted to \$495,500, and the income for the year was \$77,419. The library contained 65,000 volumes. President, Robert L. Slagle, Ph.D., LL.D.

SOUTH DAKOTA STATE COLLEGE. A State college of agriculture and mechanic arts, at Brookings, founded in 1882. The enrollment for the summer session and the autumn of 1928 was 1384, distributed as follows: Agriculture, 113; engineering, 188; home economics, 119; pharmacy, 72; commercial science, 143; printing and rural journalism, 25; trades and industries, 5; general science, 218; special students in music, 34; graduate students (included in preceding numbers), 28; secondary school of agriculture, 280; summer school, 170. The faculty, including experiment station and extension staff in agriculture and home economics, numbered 158. The productive funds of the college for the year amounted to \$749,268, with 132,000 acres of land; the income for 1927-28 for college maintenance and extension of physical plant was \$645,556, for agricultural experiment station, \$127,254, and for agricultural and home economics extension service, \$234,226. The library contained 35,000 bound volumes and 12,000 pamphlets. President, Charles W. Pugsley, B.S., D.Agr.

SOUTHERN CALIFORNIA, UNIVERSITY OF. An institution of higher education for men and women at Los Angeles, Calif., founded in 1879. It comprises the following schools and colleges: Liberal arts, music, dentistry, pharmacy, graduate, religion, law, speech, commerce and business administration, education, social welfare, architecture, engineering, medicine, international relations, and university college. The enrollment for 1927-28, including summer session and extension classes, was 15,084. For the summer session of 1928, the enrollment was 4948. In the autumn of 1928, there were 500 members on the faculty. The endowment was \$1,200,000, the income from tuition and fees, \$1,408,777, and other income \$125,637. There were 110,000 volumes in the library. Bridge Hall and a new addition to the Science Building were erected on the campus during 1927-28. President, Rufus R. von Klein-smid, Sc.D., J.D.

SOUTHWEST AFRICA. A former German protectorate, administered since Dec. 17, 1920, by the Union of South Africa under a mandate from the League of Nations; bounded on the north by Portuguese West Africa, on the west by the Atlantic Ocean, and on the south and

southeast by the Cape of Good Hope Province of the Union, and on the remainder of the eastern boundary by the Bechuanaland Protectorate. Capital, Windhoek, with a population of 4196 Europeans and 13,160 natives; area, 311,820 square miles; population, according to the census of 1926, 24,115 Europeans and about 234,790 natives. The non-German element in the European population is almost entirely South African. The chief native tribes are Hottentots, Bushmen, Hereros, Ovambos, and Bergdamarus.

In 1927 there were 50 government schools with 3083 pupils, and 31 registered private schools with 905 pupils, for the education of the white children; for the natives, there were in the same year 48 government-aided mission schools with 3945 pupils, and 12 mission schools not yet aided. Stock raising is the principal pursuit; agriculture has been found impractical on a large scale because of the scarcity of water. The principal mineral product is diamonds; others are copper, vanadium, marble, tin, gold, and silver. Under the influence of expanding mineral and agricultural development, the foreign trade of Southwest Africa has shown a consistently upward tendency. The returns for 1926 disclosed imports valued at £2,507,625 and exports amounting to £3,292,986. The estimates for 1927-28 were: Revenue, £631,500; expenditure, £1,117,002. There are about 1333 miles of government-owned railway and 98 miles of privately owned lines. The head of the government is an administrator representing the Governor-General of the Union of South Africa; he has full power to legislate and is assisted by an advisory council. Administrator in 1928, A. J. Werth, appointed in November, 1925.

SOVIET SOCIALIST REPUBLICS OF RUSSIA. See RUSSIA.

SPAIN. A constitutional monarchy of southwestern Europe, occupying the greater part of the Iberian peninsula and separated from France by the Pyrenees. Capital, Madrid.

AREA AND POPULATION. Continental Spain has an area of 190,050 square miles; including the Balearic and Canary Islands and Spanish possessions on the north and west coasts of Africa, the total area is 194,800 square miles. According to the census of 1920, the population was 21,959,086, as compared with 19,950,817 in 1910. In 1926 it was estimated at 22,290,161. The cities with over 150,000 inhabitants on Dec. 31, 1926, were as follows: Madrid, 799,894; Barcelona, 752,094; Valencia, 264,986; Seville, 213,712; Malaga, 157,990; Zaragoza, 151,855; and Murcia, 151,205. The movement of population in 1926 was: Births, 657,229; deaths, 421,762; marriages, 159,848.

EDUCATION. On Jan. 1, 1926, there were 28,870 public schools and about 5500 private schools, the total number of pupils being about 3,000,000. Secondary education is conducted in "institutions" or middle-class schools, and there must be at least one of them in every province. There were in 1926, 60 institutions with 68,916 pupils. The eleven universities, attended by 29,650 students, are situated at Barcelona, Madrid, Granada, Murcia, Oviedo, San Diego, Salamanca, Seville, Valencia, Valladolid, and Zaragoza. At Cadiz there is a medical faculty affiliated with the University of Seville, which also maintains an educational institution in the Canary Islands.

PRODUCTION. Agriculture is the principal source of national income in Spain. There were 47,

823,000 acres of arable land in 1925, equal to 38.3 per cent of the total area and 62,471,000 acres of forests and pastures. In 1927 the crops harvested were approximately equal in size to those of 1925, when their value was placed at 10,115,400,000 pesetas. More than half of Spain's exports consist of agricultural products. In 1925 there were 3,794,000 cattle, 5,267,000 swine, 20,067,000 sheep, 4,749,000 goats, and 3,061,000 horses, mules, and asses. The acreage and production of the principal crops in 1927 were as follows: Wheat, 10,826,000 acres, 144,824,000 bushels; rye, 1,818,000 acres, 26,515,000 bushels; barley, 4,452,000 acres, 92,223,000 bushels; oats, 1,909,000 acres, 39,217,000 bushels; corn, 1,143,000 acres, 20,105,000 bushels; rice, 102,000 acres, 15,161,000 bushels; potatoes, 762,000 acres, 134,692,000 bushels; sugar beets, 153,000 acres, 1,520,000 metric tons; olive orchards, 4,166,000 acres, 158,177,000 gallons of oil; grapevines, 3,417,000 acres, 585,210,000 gallons of wine.

Mineral production, though less important than agricultural, reaches large figures. In 1926 the value of crude mineral products was 475,598,000 pesetas (\$70,864,000). In 1927 there were produced 6,460,000 metric tons of coal and lignite, 646,000 tons of coke, 612,000 tons of pig iron, 122,000 tons of lead, and 17,000 tons of zinc.

The principal manufactures of Spain are cotton goods, paper, glass, sugar, cork products, silk, and metallurgical products. The number of industrial employees was as follows: 1926—minerals, 109,705; metals, 55,692; 1924—cotton textiles, 115,000, wool textiles, 26,850, silk textiles, 3110.

COMMERCE. The last year for which full trade returns were available was 1926, when the imports were valued at \$415,630,000 and the exports at \$309,879,000. The trend of foreign trade in 1927 was exceptionally strong. In that year exports to the United States were valued at 211,958,000 pesetas and imports from the United States at 512,540,000 pesetas.

FINANCE. The budget for 1928 provided for revenues of 3,258,518,604 pesetas and expenditures of 3,257,590,079. At the close of the year the receipts were stated to amount to 3,520,000,000 pesetas and the expenditures to 3,340,000,000. The ordinary budget for 1929 provided for revenues of 3,399,800,000 pesetas and expenditures of 3,370,100,000 pesetas. The total funded public debt on Dec. 31, 1927, was 17,804,000,000 pesetas. During the year the Spanish Government took action to defend the peseta from wide fluctuations caused by speculation. By royal decree dated June 25, the Government was authorized to intervene in the international exchange market for the exclusive purpose of regulating the quotation of the peseta. This decree provided also for the appointment of a committee of which the Minister of Finance acts as chairman. This committee had at its disposal a fund of 500,000,000 pesetas, half of which was provided by the Treasury and half by the Bank of Spain. It had power to open credits; to acquire or pay out foreign moneys at exchange rates which it may fix; to make contracts with companies and individuals for effecting payments abroad; to buy and sell gold in bars, coins, and notes; and in general to carry on every type of banking and mercantile operation.

COMMUNICATIONS. On June 30, 1927, the merchant marine consisted of 885 vessels of 1,161,369 gross tons. The total length of railways in

Spain was approximately 10,000 miles, of which 7256 miles were of standard gauge. The railroads belong to private companies, most of which have obtained guarantees or subventions from the Government.

On July 2, *Commerce Reports* gave the following account of the completion of the Franco-Spanish Trans-Pyrenean Railway:

With the opening of the so-called Pau-Laruns-Bedous-Canfranc-Jaca trans-Pyrenean Railway in July, 1928, by the Midi Railway, the first of three proposed trans-Pyrenean routes will have been completed. It is expected that this line, affording a new trade route between France and Spain, will result in the greatest commercial advantage to both countries. . . .

The Toulouse-Barcelona Railway, which on the French side is under construction by the Midi Railway, is expected to be completed next year. The signing of this agreement and its ratification by the two governments was affected after negotiations lasting nearly half a century, during which many factors, broadly grouped as technical, financial, and political, intervened to prevent an earlier understanding.

The first of the trans-Pyrenean railways to be completed from Bedous, France, to Jaca, Spain, will open direct communications between the Aspé Valley in France and the Aragon Valley in Spain. It is better known as the Pau-Saragossa line because its main terminals are at these points, but as express trains will come through Pau from Paris en route to Saragossa it is also referred to as the future Paris-Saragossa line. The trans-Pyrenean part of this line prolongs the existing line from Pau to Bedous, of which the section Pau-Oloron was opened in 1882 and the section Oloron-Bedous in 1914. The final section—from Bedous to the frontier—will be opened in July, 1928.

To pierce the mountains, the railway company had to build 14 tunnels on this line. The longest and most difficult is the Somport international tunnel, extending for nearly 5 miles, of which approximately 1 1/4 miles are on French and the remainder on Spanish soil. At the mouth of this tunnel on the French side the railroad tracks by gradual elevation from the valley attain a height of 3,510 feet above sea level. In its passage through the tunnel, the track rises another 460 feet and then descends somewhat until at the international station of Canfranc, the height is 3,900 feet.

The Toulouse-Barcelona trans-Pyrenean Railway, via Axles-Thermes and Ripoll, work on which is almost completed and which is expected to be opened next year, cuts through the Pyrenees at a point considerably east of the Bedous-Canfranc line and is consequently nearer to the Mediterranean coast than to the Atlantic seaboard. This railway prolongs the existing line from Toulouse to Axles-Thermes, whose section Toulouse-Foix was opened in 1862, the Foix-Tarazon section in 1877, and the section Tarazon-Axles in 1898. The final section from Axles to the frontier, work on which is proceeding in France, will be finished in time to open for exploitation in 1929. On the Spanish side a reduced service is already in operation, the delay on the French side being due to interruption of the work during the War. . . .

GOVERNMENT. According to the constitution, executive power is vested in the King, who acts through a responsible ministry, and legislative power in the Cortes, or Parliament, consisting of the Senate and Chamber of Deputies. Parliament was dissolved by royal decree, Sept. 16, 1923, and the control of the Government has been in the hands of the dictator, Primo de Rivera. He established a National Assembly with very shadowy powers late in 1927. King in 1928, Alfonso XIII, who succeeded on his birth, which occurred after the death of his father, on May 17, 1886. The civil government in 1928 was constituted as follows: President of the Council and Minister of Foreign Affairs, Primo de Rivera; Justice and Worship, Galo Ponte; War, General Duke of Tetuan; Marine, Vice Admiral Cornejo; Finance, Calvo Sotelo; Interior, Gen. M. Anido; Public Instruction, M. Callejo; Public Works, M. Benjumea; Labor, M. Aunos.

HISTORY. Spain passed through a normal year, considering the dictator form of government. General Rivera was as firmly entrenched in power at the close of the year as he was at the be-

ginning, despite a revolt or two which were easily suppressed. One bitter opponent of the Rivera régime passed from the scene with the death of Blasco Ibañez, who died, a virtual exile, in France late in January. (Consult his biography.) Early in the year, Spain also gave notice to the effect that she would remain in the League of Nations. (See LEAGUE OF NATIONS.) In July, 1928, there was published a draft of the new constitution for Spain, which had been prepared by a commission appointed some time ago for the purpose. It was stated that the actual draft was drawn up by the dictator himself.

On September 13, the fifth anniversary of the accession of Primo de Rivera to power was celebrated throughout Spain. One of the concomitant movements of all such celebrations was the suppression of a revolt which was declared to be widespread in the south of Spain. Some press articles stated that 2000 arrests followed the abortive attempt to overthrow Rivera. The Spanish Government established a stricter censorship than usual and issued statements to the effect that the movement, while it involved all shades of political opinion, was easily suppressed and did not interfere in any way whatsoever with the celebration. For Spanish international expositions, see EXPOSITIONS.

SPAIN-PORTUGAL TREATY. See ARBITRATION INTERNATIONAL.

SPANISH-AMERICAN LITERATURES.

The remarks opening this article in last year's YEAR BOOK still hold good concerning the difficulty of receiving promptly literary works from Spanish-American authors. The general movement, north and south, had not yet gotten under way as it must eventually, and hence, the chronicler's task is complicated. Again our readers must be reminded that the facts here printed must not be considered as exhaustive nor must the omission of some of the countries be taken as evidence that they produced nothing in the year 1928. It means simply that, despite all efforts, the chronicler received nothing from those countries.

ARGENTINA. Owing to a series of untoward accidents, the Argentine Academy had been seriously disrupted. By negotiations with the Royal Academy of Spain, of which it is a Correspondent, a thorough reorganization was authorized, the newly elected members being such distinguished persons as Ricardo Rojas (poet, essayist, literary historian), Arturo Capdevila (poet and magistrate), Leopoldo Lugones (poet), Manuel Gálvez (novelist, journalist, and versifier), Leopoldo Díaz (poet and politician), Manuel Ugarte (publicist), Gustavo Martínez Zubiría (novelist, Hugo West), and Enrique R. Larreta (novelist). These men are authorized to complete the number of members up to the standard 18 which applies to all the American academies which are Correspondents of the Spanish Academy.

The following items are not without interest in connection with Argentina's activity for the past year: Julio Álvarez del Vayo (publicist and journalist), *La senda roja* (very well received); Carlos Vega López, *La muerte vencida*; C. M. Ocantos (retired diplomat living at Madrid), *Novelas Argentinas: XIX—El emboscado*; and *El Locutor: Biblioteca Hernando*, tomo ii; J. Millé i Giménez, *Estudios de literatura española (Biblioteca Humanidades, editada por la Facultad de Humanidades, etc., de la Universi-*

dad de La Plata); Bartolomé Mitre, *Soledad (Facultad de Filosofía y Letras de la Universidad de Buenos Aires, Instituto de Literatura Argentina, Sección de documentos, Serie 4a. Novelas. tomo i, Núm. 4)*; Gabriel Paláu, *¿Incrédulo tú?*; Leopoldo Lugones, *Poemas solariegos* (an unusually fine piece of work and destined to last); Mario César Gras, *Los Gauchos colonos* (continues the series begun by Hernández and Güiraldes concerning Literatura Gauchesca); Arturo Capdevila, *Babel y el castellano* (it is to be noticed that the poetic jurist has a nice taste in matters of language and does not feel that in order to be patriotic he has to talk a harsh form of his ancestral tongue); Rafael Calzada, *Cincuenta años de América*. The poet, dramaturge, short-story writer, and historian, Guillermo Stock, published two works that were enthusiastically received: *El Paraíso Futuro* (a dramatic religious poem), and *Kurkara (Viajes y reflexiones de Kurkara)*. This author has done other striking things, beginning as far back as 1892 when he translated Poe (from English, not from Baudelaire's French version, as has been the case with several Spanish translations), but we can mention only the most recent: *Y soplaron otros vientos* . . . (dramatic novel, 1927); *Un ponderado Jefe de la Armada y su doble Personalidad* (1924); and *La senda pensativa* (1923).

BOLIVIA. Until 1928 Bolivia had no Academy that was recognized as a Correspondent of the Spanish Academy. During the year, however, the necessary arrangements were made and the following scholars were elected as the nucleus which should proceed to the election of the remaining members: Rosendo Villalobos (Director), one of Bolivia's most eminent poets, author of *Aves de paso*, *Memorias del corazón*, and *Ocios crueles*; Francisco Iraizóz (Censor); Victor Muñoz Reyes (Secretary); Hernando Siles (one of the most eminent of South American lawyers and author of several important treatises, such as *Código Civil*, *Código Penal*, and *Procedimiento Civil*); Félix A. del Granado (poet and prose writer); Ricardo Mújica (poet and dramatist, author of *Himno a Chuquisaca*, which won a prize in 1909, and *Ensayos Literarios*); and Florián Zambrana. The following items have come to our attention: Félix A. del Granado, *Ensayos Literarios (Biblioteca Boliviana, vol. i)*; Franz Tamayo, *Nuevos Rubáyit* (262 quatrains à la Omar Khayyám); Saturnino Rodrigo, *En la Pendiente* (comedy of Sucre customs, awarded a prize by the Círculo de Bellas Artes); Casto Rojas, *La reintegración marítima de Bolivia—Realidades* (a dignified presentation of Bolivia's case in the Tacna-Arica question); José Salmón Ballivián, *Ideario Aimará* (2d ed.; a careful study of Bolivian-Indian problems); José Aguirre Achá, *De los Andes al Amazonas—Recuerdos de la Campaña del Acre* (2d annotated and enlarged edition); G. Ríos Bridoux, *Por amor a Bolivia—Gobierno, Política, Educación* (a careful study of Bolivian problems).

CHILE. Agustín Edwards has written a book entitled *Mi tierra nativa*, which describes Chile historically, geographically, and economically with regard to each one of its districts. Of particular interest is the chapter on Araucanía, setting forth all the intimate details of the life, customs, superstitions, and legends of the Araucanians as well as the wealth of the natural

resources of the district. Of another nature is *El Chileno en Madrid*, by Edwards Bello, since, in this case, the author gives the reactions of a Chilean to what he sees about him in Madrid. Another interesting book is *El barco inmóvil*, by Edgardo Garrido Merino, the celebrated short-story writer of Chile. Among his other works may be mentioned *El poeta negro*, *La voz de la incógnita*, and *El Cristo que fué árbol*.

Scholarship was not neglected since the veteran scholar J. T. Medina gave us *Chilenismos: Apuntes lexicográficos*. During the year, Chile lost one of its great sons in the person of Francisco A. Concha Castillo, member of the Chilean Academy since 1915, poet, literary critic, philologist, and dramatist. Among other things he was the author of *Al vivir* (poems), *Escenas líricas* (dramas) and *Caracteres de la poesía Chilena y sus vinculaciones con la escuela castellana o salmantina* (his entrance discourse for the Chilean Academy). Captain Francisco A. Machuca produced *Las Cuatro Campañas de la Guerra del Pacífico*, tomo ii.

COLOMBIA. The learned secretary of the Colombian Academy, A. Gómez Restrepo, published a volume entitled *Relicario*. He was also associated with V. E. Caro in publishing vol. v of the *Obras Completas* of that great Colombian humanist, M. A. Caro. This particular volume contains *Estudios filológicos y gramaticales, Segunda Serie*.—Alfredo Gómez Jaime wrote an attractive volume of verse entitled *Armonía y emoción*.—The most astounding performance of the year was that of José Eustasio Rivera in the production of *La Vorágine*. Few works in any land have won such general approval from the critics of so many countries and in terms so cordial. It is a rare example of the power to reproduce the milieu and associate it so intimately with the characters of the book. It is a marvelous picture of the forests of the Amazon. It had been translated into several languages and at the end of the year was about to appear in English.

One of the most interesting literary events of the year was connected with the person of Daniel Samper Ortega, the dramatist, novelist, and journalist, who lectured on Colombia and its literature from the very chair of Fray Luis de León when the University of Salamanca celebrated the four hundredth anniversary of the great Augustinian (Dec. 6, 1927); and later, in Bogotá (on the King's birthday, May 17, 1928) in the Gimnasio Moderno, he gave a lecture on the greatest of all the Spanish mystics. The date for this second lecture was chosen at the request of the Rector of the University of Salamanca, who gave the visiting lecturer a special commission back to his own institution. Both occasions are included in his book, *Conferencia sobre Fray Luis de León*. It is interesting to note that the chair of Fray Luis had been kept closed until this centenary year and that it was opened for an American, Dr. James Brown Scott, Nov. 11, 1927; Samper Ortega being the first Hispano-American to occupy it.

COSTA RICA. Ricardo Fernández Guardia gave us a volume entitled *La independencia y otros episodios*. A former minister of public instruction in 1928 teaching at Northwestern University, Roberto Brenes-Mesén, published a handsome new volume of verse entitled *Los dioses vuelven*. Other poetic works of his are: *En el Silencio*, *Hacia Nuevos Umbrales*, *Voces del Angelus*, and

Pastorales y Jacintos. He is also the author of the very scholarly work, *Gramática, Histórica, y lógica de la lengua castellana: Parte I: Fonología y morfología*.

CUBA. The learned jurisconsult, D. V. Tejera (Hijo), had again been studying important social problems and within the year published the following titles: *Soberanía de las Convenciones*, *Responsabilidad Penal en que incurren Los Imponedores de Modas*, *La Denuncia y las Ideas Modernas*, *Protecciones Generales para los niños que deben figurar en el código penal*, *El Juego en el derecho penal del Manava-Dharma-Sastra*, and especially his study entitled *El Adulterio*. We have also *Cuestiones Cubanas*, by Emilia Bernal, and Ramón de Palma gave us *Cuentos Cubanos* with an introduction by A. M. Eligio de la Puente. The recently established Academia Cubana (related duly to the Real Academia Española) lost one of its most distinguished members through the death of Carlos Loveira, a renowned jurisconsult and Cuba's representative in the League of Nations. Cuba lost also the poet, Vicente Silveira Arjona, a simple mulatto workman (born in Guanajay, 1841) who by dint of great efforts obtained an education above the average and published, among other things, *Flores y espinas* (1873) and *Florescencias de invierno* (1910).

ECUADOR. L. Pallares Arteta wrote *La Danza de los Colores*; and Benjamín Carrión, *Los Creadores de la Nueva América*, with prologue by Gabriela Mistral, the Chilean poetess. This volume deals with the Mexican, José Vasconcelos, the Argentine, Manuel Ugarte, the Peruvian, F. García Calderón, and the Bolivian, Alcides Arguedas.

GUATEMALA. The Guatemalan poet, Rafael Arévalo Martínez, published recently two volumes, one containing the novel, *El hombre que parecía un caballo*, and some verse under the title, *Las rosas de Engaddi*. The other volume contains a new novel, *Las noches en el palacio de la Nunciatura*, and a short novel entitled *Sentas* but written as far back as 1910.

HONDURAS. From Honduras may be noted a very important little work entitled *Bosquejo Histórico de Honduras: 1502-1921*, by Rómulo E. Durón.

MEXICO. The Mexican Academy lost early in the year its distinguished Catholic journalist the author of various philosophical studies, e.g. *Lo escencial en el positivismo*, and political questions, e.g., *Código de la reforma*, i.e., Francisco Pascual García. To succeed to the vacancy thus created, the historian, Antonio de la Peña y Reyes, was elected but died in October before he could take possession of his chair. The greatest loss, however, was that of the beloved national bard, Salvador Díaz Mirón, whose funeral was a veritable national tribute from all classes of society. See MIRÓN. Various works of importance appeared, of which the following are some of the most important: Genaro Estrada, *Crucero* (Poésías); M. Gómez Morín, *El Crédito Agrícola en México*, and *España Fiel*; M. Gómez Palacios (novelist and poet), *El Mejor de los Mundos Posibles* (*Romance de Episodios Nacionales*); M. L. Guzmán, *El Águila y la Serpiente*; M. Horta Vide Ejemplar de D. José de la Borda; J. Jiménez Rueda, *La Silueta de Humo* and *Historia de la Literatura Mexicana*; E. Luquín, *Telones de Fondo*; F. Monterde (critic), *Perfiles de Taxco*; G. Owen, *Novela como Nube*; J. J. Tablada, L.

Feria; E. Villaseñor, *Éxtasis* (Novela de Aventuras); X. Villaurrutia, *Dama de Corazones*; Rosenberg and Templin, *Anthology of Mexican Verse*; B. J. Gastelum (the psychologist), *Inteligencia y Símbolo* (1927) and *La Clase: Arquitectura de la Comunidad* (La Clase forms part of a larger work to be entitled *Física de la Actitud*); J. Torres Bodet, author of a highly praised volume, *Poesías* (1923), and *Margarita de Niebla* (1927), has just published *Perspectiva de la Literatura Mexicana actual* (1915-1928), containing a useful bibliography of the period concerned, and *Contemporáneos* (*Notas de Crítica*); Esperanza Velázquez Bringas and Rafael Heliodoro Valle, *Índice de Escritores*, a very useful book of data concerning 252 writers, 22 of whom are Spanish, the remainder Spanish-American. The second of these two writers, Rafael Heliodoro Valle, has written some serious studies in the history of diplomacy and the history of the Church, as will be seen from the titles, *La Aneación de Centro América a México* and *El Convento de Tepotzotlan*.

NICARAGUA. For many years Nicaragua was like some other countries in Spanish-America, without an Academy that was a Correspondent of the Spanish Royal Academy. Under negotiations carried out during 1928, Nicaragua was authorized to have such an Academy and the following seven persons were elected and empowered to fill the remaining vacancies: Carlos Cuadra Pasos (Minister of Foreign Affairs), Director; Francisco Paniagua Prado (jurisconsult, publicist, and writer), Perpetual Secretary; Manuel Maldonado, Censor; José Antonio Lazcano (Archbishop and Metropolitan of Managua), Treasurer; Pedro Joaquín Chamorro (politician), Librarian. On the day of inauguration (August 8), a government decree gave the Academy juridical status, established biennial prizes, commissioned it to make a dictionary of provincialisms, and housed it officially in the National Library which it placed under its direction. Nicaragua lost the poet Ramón Sáenz Morales.

PERU. A book of the year was *Lima y Ricardo Palma*, by Luis Alberto Sánchez.

REPUBLICA DOMINICANA. Federico Enríquez Carvajal, *Mi album de sonetos*; and José Joaquín Pérez, *La Lira*, are notable works.

SAN SALVADOR. Arturo H. Lara wrote *Monañas de Cristal*.

VENEZUELA. The polygraph, Rufino Blanco Fombona, wrote *Tragedias grotescas* which was highly praised, even to the point of being mentioned for the Nobel Prize; the poet, Udón Pérez, wrote *Láurea*; and L. E. Mármol, *La locura del otro*. R. Silva Uzcátegui won the Royal Spanish Academy's Hispano-American Prize for 1927-28 with his *Historia crítica del Modernismo en la literatura castellana*, a book which appeared in 1925.

SPANISH LITERATURE. For the third year in succession, the dramatic output in 1928 seemed to have run ahead of those of the other branches and this time erudition seemed to have outstripped fiction. The transition movement mentioned in the 1927 YEAR BOOK's account still remained with its outlines somewhat blurred and disconcerting.

DRAMA. Some of the older generation gave evidence of continued fecundity: J. Benavente, *Pepa doncel*, and *El Demonio fué antes ángel*; the Alvarez Quintero brothers, *Los mosquitos*, *Novelera*, and *Rondalla*; E. Marquina, *La vida*

es más, *La dueña del mundo*, and *Pasión y muerte*; Luis Fernández de Ardevín, *La Maja* and *Via Crucis*; Carlos Arniches, *El señor Adrián*, o ¿Qué malo es ser bueno!; P. Muñoz Seca and Pérez Fernández, *La Lola*; M. Linares Rivas, *El rosa de las tres rosas* and *La última novela*; the poetio Machado brothers, Manuel and Antonio, gave a great comedy in verse, *Las adelfas*; M. Fontdevila, *El caballero inmoral* and *La dona verge*, translated by L. Bejarno as *La protegida* (melodrama, wildly received in both versions); J. Grau, *El caballero Varona*, and *El señor de Pigmalión*; Julio de Hoyos, *Tigre Juan* (adapted from Pérez de Ayala's novel, *Tigre Juan*, el curandero de su honra); Pilar Millán Astray (sainetista), *Mademoiselle Naná*; and Felipe Sassone, *Sí, señor; se casa la niña*, *Paloma*, and *No tengo nada que hacer*.

The following may also be noted: Alejandro Mac-Kinlay, *El que no puede amar* (original note on an old theme: the Devil incarnates in the person of a man seeking true love on earth, but, under curse, fails on every occasion, since, every time he approaches the object of his affections, he feels an aversion that is the reverse of the primitive love-longing that had led him to her); González Parra (a blind author), *Más que la honra*; Luis de Vargas, *Don Floripondio* (tragi-comedy of a man so grotesque as to be denied the paradise of love); and a few new dramatists: Honorio Maura (one of the best of the younger group), *Cuento de Hadassas, Raquel* (great success), *La Muralla de oro*, and *Su mano derecha* (his best so far, in sparkling dialogue); Ignacio Sánchez Mejías (a beginner of much promise), *Sinrazón* (the clearest note of originality of the season: a play among idiots; where everything happens naturally); E. Suárez de Deza, *Te quiero, te adoro!*, *Los marineros*, and *La chica del Citroën*; Leandro Navarro and Pérez Moris (the latter new), *¿Mi mujer no es mi mujer?*; Antonio de Guzmán, *Los Gonzalones* (which won the competition for new authors conducted by "A B C"); and Eusebio de Gorbea (a new dramatist of extraordinary power) published his notable play, *Los que no perdonan*.

FICTION. The following well-known men have lived up to their reputations: A. Palacio Valdés, *Cármenes de Granada*; Eduardo Zamacois, *Las raíces* (hailed as magnificent); W. Fernández Flórez, *Relato inmoral* (masterly exhibition of his gifts as a satirist); José Más, *La huida*; J. M. Salaverría, *El muñeco de trapo*; A. Insúa, *Humo, dolor, placer* (equals anything he has yet done); A. Cotarelo Valledor, *Lar: Contos de Nadal*. Less well-known writers who attracted favorable attention are Dr. César Juarros, *El niño que no tuvo infancia*; Carmen Díaz (14 years old), *Mis muñecas* (interesting, with prologue by Santiago Camarasa); Emiliano Ramírez Ángel, *Uno de los dos*; Ceferino R. Avecilla, *La sombra enmascarada* (beautiful); Diego San José, *El humo de la gloria* and *El abogado del diablo*; Adolfo de Sandoval, *Fuencisla Moyano*; and Ricardo León, *Jauja*.

POETRY. The following items, while not very numerous, are really quite worth while: Concha Méndez Cuesta, *Surtidor*; A. Quijano y Quijano, *Visión lejana y otros poemas*; Luis Ardila, *Alma desnuda* (beautiful); Luis Amado Blanco, *Norte* (exquisite); J. M. Monfort, *Por la senda solitaria* (fine); Ricardo Sánchez Madrigal, *Flores de Murcia*; Marqués de Figueroa, *Libro de can-*

tigas, en tierras galaico-lusitanas; and A. Bórquez Solar, *El Paladín trovador*—Poema dramático.

ERUDITION. Among the most interesting things in the scholarly output of Spain are the following: Andrés Torre Ruiz, *Dos ensayos* (keen æsthetic studies); Aurelio Báig Baños, *Historiografía de España y América*; V. García Rey, *El deán don Diego de Castilla*; F. Carmona Nenciales, *El amor y la muerte en las novelas de Insúa and Vida y literatura de Blanco Fombona*; José Díaz Fernández, *El bloca*; Marqués de Villaurrutia, *España en el Congreso de Viena, según la correspondencia oficial de don Pedro Gómez Labrador, Marqués de Labrador* (2d ed. revised and enlarged) and *Palique Diplomático: Recuerdos de un Embajador*: Prólogo de . . . M. González Hontoria, Segunda Serie; Miguel Artigas, *Góngora y el gongorismo*; A. Castro, A. Millares Carlo, and A. J. Battistessa, *Biblia medieval romanceada, según los manuscritos escurialenses*; A. Malaret, *Fe de erratas de mi Diccionario de Americanismos*; R. Menéndez Pidal, *El Idioma Español en sus primeros tiempos*, vol. ii; J. Ribera y Tarragó, *Disertaciones y opúsculos (edición colectiva que en su Jubilación del Profesorado le ofrecen sus discípulos y amigos: 1887-1927), con introducción de M. Asín Palacios*; M. de Saralegui y Medina, *Escarceos filológicos; El Testamento de Colón*; Juan Verdades; L. Carré Alvarellos, *Diccionario Galego-Castelán, Tomo I; Diccionario Catalá-Valenciá-Baleár* (through vol. i, fasc. 6); F. Navas, *Las esfinges de Talía*; M. Mozas Mesa, *Mi libro: variedades literarias*; J. Camba, *Sobre casi todo*; Beatriz Díaz de Rabaneda, *Alma inquieta* (proves herself to be a profound thinker); T. Ortega, *La voz del paisaje*; Lope de Vega, *El castigo sin venganza* (ed. conforme al MS autógrafo de la Ticknor Library de Boston por Adolfo Van Dam); J. A. Balseiro, *El Vigía, Ensayos, II*; A. Hamel, *Lesebuch der Spanischen Literatur des XIX und XX Jahrhunderts*; Barbara Matulka, *The Cid as a Courty Hero from the Amadis to Corneille*; N. Alonso Cortés, *La muerte del Conde de Villamediana; Clásicos Castellanos*, vols. 81-90; G. L. Doty, *Juan de Zabaleta, El Día de Fiesta por la Mañana*; and E. Cotarelo y Mori, *Discurso acerca de las obras publicadas por la Real Academia Española*. The volume *Miguel de Unamuno, novelista-poeta-ensayista*, by M. Romero-Navarro, is a very important study of that noted character, quondam Rector of the venerable University of Salamanca.

ROYAL ACADEMY. The Academy was unusually active in the year 1928. In addition to making for the *Fiesta del Libro* an exhibition of all the books that it has published in its two centuries of existence, it fomented the establishment of several Academies in the Americas: the Nicaraguan Academy and Bolivian National Academy were established, and the Argentine Academy was reorganized; and it awarded several prizes. The Fastenrath Prize for History, in 1927, went to Félix Llanos y Torriglia for his *Así llegó a reinar Doña Isabel la Católica*.—The Piquer Prize for Drama, in 1927, was won by E. Marquina, with *La ermita, la fuente y el río*.—The Hispano-American Prize for 1928 was awarded to R. Silva Uzcátegui of Venezuela for *Historia crítica del Modernismo en la literatura castellana*.—The Asociación de la Prensa de Santander organized a 1928 poetic contest, on the theme: *Canto a la mujer*. The prize of 5000 pesetas was won by

Manuel de Góngora, with *Española fué mi madre, y la madre de mis hijos*.—The Academy had established in 1924 the Camoens Prize to be awarded in 1928 at the centenary of the Portuguese poet, and the prize was awarded to M. Marques F. Braga for his essay on how to edit the Spanish works of Camoens. It has announced also a Centenary Prize in honor of Leandro Fernández de Moratín, the subject being the best vocabulary of the author's works, as compared with that of his contemporaries.—The Academy made a facsimile reprint of the first edition (Salamanca, 1496) of the *Cancionero de Juan del Encina*, from the only two known copies (each incomplete, but mutually completing each other).—To replace J. Rodríguez Carracido, choice was made of Augustín González de Amezúa, lawyer, man of letters, crowned by the Academy in 1912 in a public contest, for his critical edition of two of Cervantes' *Novelas ejemplares*; and to replace the member-elect (the renowned philosopher and orator, Juan Vázquez Mella), the famous young novelist, Ramón Pérez de Ayala.

NECROLOGY. Spanish letters again suffered heavily both at home and abroad. In addition to the two deaths just mentioned, we must chronicle the following: the novelist, Vicente Blasco Ibañez; the Marqués de Laurencín (historian and director of the Royal Academy of History); H. A. Rennert (the authority on Lope de Vega); Charles Fletcher Lummis (authority on the Southwest); Antonio de la Peña y Reyes (historian and member-elect of the Mexican Academy); Ricardo de la Vega (celebrated actor); Ceferino Palencia y Alvarez (equally celebrated as actor); and María Guerrero (for fifty years the queen of the Spanish stage).

SPIRITUALISM. See PSYCHICAL RESEARCH.

SPIRITUALIST ASSOCIATION, NATIONAL. An organization maintaining the religious belief that the spirit world forms a counterpart of the world of common experience. Spiritualism originated as a doctrine in the writings of Andrew Jackson Davis, in 1845, and local groups came into existence in considerable numbers in many parts of the United States between 1850 and 1872, but it was not until 1893 that the national organization of these groups took the form of the present association. In 1928 there were 22 State associations and many local societies and churches in territory outside the State organizations. The general activities are carried on through four bureaus: Progressive Lyceums (Sunday schools); the Bureau of Phenomenal Evidence; the Bureau of Propaganda; and the Bureau of Education. The organization conducts the Morris Pratt Institute, Whitewater, Wis., and issues the periodicals *Progressive Thinker*, *Banner of Life, Reason*, and *The National Spiritualist*. Officers in 1928 were: President, Joseph P. Whitwell, St. Paul, Minn.; secretary, the Rev. Harry P. Strack, Washington, D. C.; treasurer, F. W. Constantine, Buffalo, N. Y.

SPITZBERGEN. See WEST SPITZBERGEN; also SVALBARD.

SPORTS. Articles covering the activities in the various sports during 1928 will be found under such titles as **ATHLETICS**, **BASEBALL**, **FOOTBALL**, **GOLF**, **OLYMPIC GAMES**, **RACING**, **TENNIS**.

SPROUL, WILLIAM CAMERON. American public official, farmer, manufacturer, and journalist, died at Chester, Pa., March 21. He was born at Octoraro, Pa., Sept. 16, 1870, and was graduated from Swarthmore College in 1891. For several years he was engaged in farming, and afterward he organized important iron and steel plants and developed railroads, mining, traction, and power enterprises in West Virginia. In 1896 he was elected to the Pennsylvania Senate as a Republican, and was reelected five times. He was elected Governor of Pennsylvania in 1919 and served until 1923. Mr. Sproul took an especial interest in the development of highways, and was known as "the father of good roads in Pennsylvania"; he brought about the adoption of a State road-building programme calling for the expenditure of \$50,000,000. At the Republican National Convention of 1920, Governor Sproul received the entire vote of his State for the presidential nomination, through seven ballots. Among his varied and extensive interests was the presidency of the *Daily Times*, Chester, Pa. and the *Morning Republican* of the same place. He was the owner of nearly 2000 acres of orchards in Pennsylvania. Governor Sproul was a trustee of Swarthmore College, and built and endowed the Sproul Observatory at the college. He received the degree of LL.D. from nine colleges and universities, including Swarthmore and the University of Pennsylvania.

STABILIZATION OF THE FRANC. See FRANCE.

STANFORD UNIVERSITY. A non-sectarian institution for the higher education of men and women at Stanford University, Calif., founded in 1891 in memory of Leland Stanford, Jr. The enrollment for the autumn quarter of 1928 was 3478, and for the summer quarter, 1345. The faculty numbered 506. The productive funds of the university amounted to \$29,518,042, and the budget income for the year, including fees, was \$2,787,190. The library contained 490,000 volumes (including the Hoover War Library). Gifts received during the year were: For research and scholarships, \$235,312; special funds, \$7860; for new buildings, \$8168; for endowment, \$326,395. President, Ray Lyman Wilbur, M.D., Sc.D., LL.D.

STATISTICAL ASSOCIATION, AMERICAN. An organization founded in Boston in 1830 to foster an interest in statistics and to promote scientific methods of collection and interpretation of statistical data. Among the committees maintained during 1928 to improve both public and private statistical work were: The Joint Advisory Committee on the Census, composed of six members, of whom three are appointed by the Association, to advise the Directors of the Census on important questions of statistical policy; the Committee on Governmental Labor Statistics, to standardize statistics on employment hours and earnings in the various States and in the Dominion of Canada; and the Committee on Institutional Statistics. The Committee on Social Statistics worked to improve statistical work in social organizations and the Committee on the Encyclopedia of the Social Sciences was engaged in the preparation of that Encyclopædia. The various Association chapters meet from time to

time in the leading cities of the United States and an annual meeting of the entire Association is held. The 1928 meeting was held at Chicago, Ill., Dec. 27, 1928. The official publication is *The Journal of the American Statistical Association*, a quarterly. The officers of the Association for 1928 were: President, Carl Snyder; vice presidents, Seymour L. Andrew, Raymond Pearl, Ralph Hurlin; counselors, James W. Glover, W. Randolph Burgess, and R. H. Coats; secretary-treasurer, Willford I. King; editor, Frank Alexander Ross. The headquarters of the Association are at 530 Commerce Building, New York University, 236 Wooster Street, New York.

STATISTICS. In our modern world the work of the statistician has become well-nigh indispensable to the conduct of almost every activity. Statistical analyses play important rôles in education, agriculture, insurance, marketing, transportation, banking, commerce, business, advertising, even retail selling. The work of such expert groups as the Bureau of the Census and the Bureau of Labor Statistics among governmental agencies and the Harvard Economic Society among private agencies is too well-known for comment. In the United States, the *Journal* of the American Statistical Association, in England the *Journal* of the Royal Statistical Society, and on the Continent the *Journal* de la Société de Statistique de Paris and the international *Metron* are continuously preoccupying themselves with the exposition of method as well as the results of statistical research in a hundred and one different pursuits. For example, one finds in these magazines articles on subjects as diverse as the following: "Arc Tangent in Trend Determination," "Statistics of Room Congestion," "The Causes of Illness at Different Ages," "The Vital Statistics of Wealth and Poverty," "Bankruptcy Risks by Professions," "The Population of Palestine and the Outlook for Zionism," etc., etc.

It would be impossible in the limits of a single article such as this to discuss the progress of statistical research for the past year with any degree of completeness or, in fact, intelligence. A compromise has been effected by the use of statistics in those articles in this volume where such analyses will help to discover trends. For example, the reader is referred to the following articles for statistical presentations that are of significance: CHILD LABOR, OLD-AGE PENSIONS, WOMEN IN INDUSTRY, COÖPERATION, STRIKES, WORKMEN'S COMPENSATION, CRIME, TRADE UNIONISM, IMMIGRATION, MARRIAGE AND DIVORCE, WELFARE WORK, UNEMPLOYMENT, FINANCE, AGRICULTURE, MATERNITY PROTECTION. In these articles will be found statistics referring to labor economics, vital statistics, crop production, etc., etc. In the paragraphs that follow are displayed in tabular form statistics of wages and the cost of living.

INDEX NUMBERS OF WAGES. The Bureau of Labor Statistics had compiled a series of index numbers of general wage rates (other than agricultural) beginning with the year 1840. These figures had been brought down to 1926 and are presented in the table on the following pages.

The International Labor Office, in order to satisfy the prevailing curiosity concerning the size of real wages in various countries, made such a comparative study for January, 1928, taking

the city of Philadelphia as representative of the United States. The index numbers are for real wages. The examination was limited to a few trades, i. e., building, metal, furniture, printing, and publishing, and the price data were limited to a few articles of food. The figures are necessarily rough, but they serve a value for comparative purposes.

INDEX NUMBERS OF WAGES PER HOUR, 1840
TO 1926 (EXCLUSIVE OF AGRICULTURE)
[Currency basis during Civil War period. 1913 = 100]

Year	Index	Year	Index
1840	33	1884	64
1841	34	1885	64

UNION WAGE RATES. The annual survey of the Bureau of Labor Statistics indicated that union wage rates in the United States were slightly higher for 1928 over 1927. The study, which included the wages of over three-fourths of a million organized workers, and covered most of the

time-work trades in 67 industries, showed that the average hourly wage for 1928 was \$1.159 as compared with \$1.154 in 1927. The following table shows the average hourly wage rates in a number of trade groups, comparing 1927 with 1928.

Trade group	Average hourly wage Increase, rate 1928 over 1927		
	1927	1928	1928 over 1927
Bakers	\$0.957	\$0.954	\$0.003 ^a
Building-trades workers	1.323	1.330	.007
Chauffeurs and teamsters and drivers	.704	.712	.008
Granite and stone cutters	1.321	1.335	.014
Laundry workers	.432	.447	.015
Linemen	.991	1.007	.016
Longshoremen	.817	.858	.041
Printing and publishing:			
Book and job	1.021	1.036	.015
Newspaper	1.190	1.220	.030
Average ^b	\$1.190	\$1.195	\$.005
Motormen and conductors	\$.682	\$.685	\$.003
Bus drivers	.700	.666	-.034 ^a
Grand average, all trades ^b	\$1.154	\$1.159	\$0.005

^a Decrease. ^b Not including pieceworkers.

The hours of labor averaged 44.9 in 1928 as compared with 45.4 in 1927. In May, 1928, the following was the length of the week for the trades studied: bakers, 47.4 hours; building trades, 43.5 hours; chauffeurs and teamsters, 54.8 hours; granite and stone trades, 44 hours; printing and publishing trades (book and job), 44.3 hours; printing and publishing (newspaper), 45.1.

Comparing 1928 with preceding years, it is interesting here to observe that the average hourly wage rate for 1928 was 0.4 per cent higher than the figure for 1927, 128.3 per cent higher than the figure for 1917, 160.6 per cent higher than the figure for 1913, 175.9 per cent higher than the figure for 1910, and 190.5 per cent higher than the figure for 1907. Translated into index numbers with the base of 100 at 1913, we find the following:

Year	Index numbers of Rate of wages per hour	Index numbers of Hours per full- time week	Year	Index numbers of Rate of wages per hour	Index numbers of Hours per full- time week
1907	89.7	102.6	1918	132.7	97.0
1908	91.0	102.1	1919	154.5	94.7
1909	91.9	101.9	1920	199.0	93.8
1910	94.4	101.1	1921	205.3	93.9
1911	96.0	100.7	1922	193.1	94.4
1912	97.6	100.3	1923	210.6	94.3
1913	100.0	100.0	1924	228.1	93.9
1914	101.9	99.6	1925	237.9	93.0
1915	102.8	99.4	1926	250.3	92.8
1916	107.2	98.8	1927	259.5	92.4
1917	114.2	98.4	1928	260.6	91.9

INDEX NUMBERS OF COST OF LIVING. The U. S. Department of Labor makes a special study of cost-of-living data for 32 American cities. These figures are collected in June and December of every year. Naturally, they are estimates in that the compilers of the figures must weigh the prices of the articles being used on the basis of some mythical family budget. The family budget used for weighing purposes was made in 1918-19 on the basis of an examination of the expenditures of 12,096 families. There is presented herewith the Department's index numbers for the cost of living from 1913 to June, 1928.

INDEX NUMBERS SHOWING CHANGES IN COST
OF LIVING IN THE UNITED STATES, 1913
TO JUNE, 1928

Date	Index Nos.	Date	Index Nos.
Average, 1913	100.0	December, 1922	169.5
December, 1914	103.0	March, 1923	168.8
December, 1915	105.1	June, 1923	169.7
December, 1916	118.3	September, 1923	172.1
December, 1917	142.4	December, 1923	173.2
December, 1918	174.4	March, 1924	170.4
June, 1919	177.3	June, 1924	169.1
December, 1919	199.3	September, 1924	170.6
June, 1920	216.5	December, 1924	172.5

March, 1922	166.9	June, 1927	173.4
June, 1922	166.4	December, 1927	172.0
September, 1922	166.3	June, 1928	170.0

MEETINGS. In November, under the auspices of the League of Nations, there was convened the *International Statistical Conference* at Geneva. This meeting was regarded as being so important that states not members of the League of Nations sent delegates. Such countries included the United States, Russia, Ecuador, and Mexico. The purpose of the conference was to attempt to standardize the collection of statistics so that they would be comparable on an international basis. The American delegation on which were E. Dana Durand, of the Department of Commerce, and Messrs. Estabrook and Hobson, indicated that Washington looked with favor on the creation of a permanent international statistical office. The international significance of statistics was strikingly shown by the complaint of the International Federation of Master Cotton Spinners that the publication of cotton-crop forecasts by the U. S. Department of Agriculture accounted for periods of stagnation throughout the whole world during a three-day interval before and a similar interval after these releases.

The *American Statistical Association* held its ninetyeth annual meeting at Chicago beginning December 27. (See above.) It is interesting to report the subjects of the general discussions to see how bewilderingly complex, and therefore specialized, the field of statistics has become: "The Stock Boom and the Value of Common Stocks," "What Do the Unemployment Figures Mean and How Can They Be Improved?" "Banking Policy and the Business Cycle," "Mathematical Statistics," "The Farmer's Income," "Social Costs of Accidents, Illness, and Old Age," "The New Institutes of Industry and Statistical Control of Production," "Regional Indexes of Trade," "Statistical Technique," "Index Numbers and the Measures of Value," "Recent Advances in Astronomy and the Use of Statistical Methods."

STATLER, ELLSWORTH MILTON. American hotel builder and manager, died at New York, April 16. He was born in Somerset County, Pennsylvania, Oct. 26, 1863, and received little formal education, being put to work at an early age as a stoker in a glass factory at Wheeling, W. Va. His first experience in the hotel business was gained as a bell boy at the McClure House, Wheeling, where he rose to become day clerk. He then purchased the billiard room and railway ticket concessions in the hotel and was successful in that field. He next conducted an unsuccessful restaurant at Buffalo, N. Y., and a rooming house at the Pan-American Exposition, Buffalo, in 1901, followed by a similar house at the Louisiana Purchase Exposition, St. Louis, Mo.,

in 1904. Mr. Statler's first large venture was the building of the Hotel Statler (now the Hotel Buffalo) at Buffalo, in which he introduced many innovations. The hotel was successful, and a chain of similar hostelrys followed, in Cleveland, Ohio, Detroit, Mich., St. Louis, Mo., and Boston, Mass. Mr. Statler also obtained a lease for the operation of the Hotel Pennsylvania, New York City. He was prominent in the affairs of hotel men's associations.

STEAMBOAT INSPECTION SERVICE, UNITED STATES. See SAFETY AT SEA.

STEAM BOILERS. See BOILERS.

STEAM ENGINE. No important progress was to be noted in this field, most of the advances being scored under STEAM TURBINES as discussed below.

STEAM TURBINES. In the steam turbine field, 1928 was notable for the number of exceptionally large units installed in central stations and the increased use of high back-pressure and bleeder turbines furnishing steam to process in industrial plants. Among the large units, there were two of 165,000 kilowatts, two of 160,000 kilowatts, one of 110,000 kilowatts, another of 94,000 kilowatts, and two of 75,000 kilowatts. Worthy of special mention is the 160,000-kilowatt tandem turbine being installed at the East River Station of the New York Edison Company, inasmuch as the single generator has two separate windings in alternate slots, each having a capacity of 80,000 kilowatts. These windings are not connected electrically but tie in with adjacent bus sections. Thus, half the load can be carried on one winding should the other go out of commission.

Details of design that received attention during the year included altered blade dimensions, improved methods of attachments, and refinements in blade finishing and in materials. Better blade materials made longer blades possible with attendant reduction in leaving losses at the last stage. Clearances have also been reduced and improvements have been made in generator cooling which has decreased the electrical losses.

The 208,000-kilowatt machine ordered for the State Line Station, near Chicago, and announced in 1927 was not in operation but was being installed.

It would appear that 75,000 kilowatts was about the limit for single-cylinder machines, 160,000 kilowatts for tandem-compound units, and 208,000 kilowatts for cross-compound turbines. None of these large machines operates on pressures higher than 600 pounds, 750° Fahr., although 55,000-kilowatt units were on order, the high-pressure elements of which would operate on 1200 to 1400 pounds. Those units operating on these high pressures were 10,000 kilowatts or under. Reheating between the high- and low-pressure elements was employed in all cases of 600 pounds or over.

The starting of steam turbines was another subject that received attention during the year. When a spindle has come to rest after the machine has been shut down, distortion often occurs during cooling because the bottom portion cools more rapidly than the upper. A number of cases of serious rubbing between stationary and moving blades, as well as several sprung spindles, led to the development of devices for cooling all parts of the spindle uniformly and thus avoiding distortion, so that the turbine could be put into operation in a minimum period.

One method for accomplishing this consists of a hydraulic barring gear by which the operator can turn the spindle 180 degrees at intervals. A high-pressure oil pump keeps the bearings floating during operation. A second method, which had proved satisfactory for large machines, is the use of a small motor which is thrown into gear with the spindle when the latter in slowing down has reached 25 to 30 r.p.m. This motor continues to rotate the spindle during the shut-down period and thus insures uniform cooling. See DYNAMO-ELECTRIC MACHINERY; POWER PLANTS, STEAM.

STEEL. See IRON AND STEEL; CHEMISTRY, INDUSTRIAL.

STEEL IN CONSTRUCTION. See BRIDGES.

STEINMETZ, JOSEPH ALLISON. American engineer and pioneer in the development of aviation, died at Philadelphia, Pa. July 11. He was born at Philadelphia, Mar. 22, 1870, and studied at Lehigh University, 1900. He was an assistant of Prof. Samuel P. Langley in producing special steel parts for early airplane engines, in 1900. From 1908 until his death he was the senior member of the firm of Janney-Steinmetz & Co., makers of seamless steel containers, and he was also president of the American Register Corporation and associated with the American Car & Foundry Company. He designed and patented numerous devices for aerial and submarine warfare, and was the founder and director of the School of Aircraft Building, Philadelphia, chairman of the committee on aeronautics of the American Society of Mechanical Engineers (1922-23), and president of the Aëro Club of Philadelphia (1915-21). Mr. Steinmetz located Hog Island as the site for a war shipyard, was a member of the Submarine Defense Association, of New York, 1917-19, and was sent overseas on special service for the War Industries Survey, 1918-19. He was also a member of the engineering division of the National Research Council, 1918, and in 1919 held the rank of major in Ordnance, U. S. Army Reserves.

STELLAR EVOLUTION. See ASTRONOMY.

STETSON, AUGUSTA EMMA. American Christian Science leader, died at Rochester, N. Y., October 12. She was born at Waldoboro, Me., about 1842, the daughter of Peabody and Salome Simmons. Having married Captain Frederick J. Stetson, in 1867, she lived in Europe for several years before her husband's death. She returned to the United States, and while studying elocution at the Blish School of Oratory, Boston, she became a friend and pupil of Mary Baker Eddy, the founder of Christian Science. Mrs. Stetson was graduated with the degree of Christian Science Doctor, from the Metaphysical College, Boston, in 1884, and she at first practiced healing in Boston. In 1885 she preached on alternate Sundays at The Mother Church, Chickering Hall, Boston, and the following year Mrs. Eddy sent her to New York City where she was among those who organized the First Church of Christ, Scientist. Mrs. Stetson was appointed pastor of this church in 1888, and her sermons soon attracted a congregation which rivaled that of The Mother Church. In 1895 Mrs. Eddy having eliminated sermons from the church service, Mrs. Stetson continued as first reader and so successful was she in her work that she and her followers consecrated a handsome new church in 1903 built at a cost of \$250,000. The Boston Christian Scientists, however, were afraid that Mrs. Stetson was trying to supplant Mrs. Eddy,

and her opponents accused her of unorthodox healing practices. The Mother Church revoked her license for three years in October, 1909, and after she had been tried for insubordination, the following month, she was dismissed from the church. When Mrs. Eddy died, in 1910, Mrs. Stetson predicted that her former teacher would return to earth, and she also repeatedly affirmed her belief in her own immortality. She spoke of herself as Mrs. Eddy's successor, and as the spiritual leader of the Christian Science Church, in her book, *Reminiscences, Sermons and Correspondence* (1913). She and her followers carried on an extensive advertising propaganda, through books, newspapers, and radio, to advance and defend Mrs. Stetson's Christian Science doctrines.

STEVENS, EMILY. American actress, died at New York, January 2. She was born at New York, in 1882. She was educated at the Institute of the Holy Angels, Fort Lee, N. J., and at St. Mary's Hall, Burlington, N. J. She came of a theatrical family, and her stage début was made in 1900, in the part of a maid in the production of *Becky Sharp* by Minnie Maddern Fiske, a cousin of Miss Stevens. She remained with Mrs. Fiske's company for eight years in a succession of minor parts, and later she played with Bertha Kalich and Grace George. Then, in 1909, she scored her first definite success in *Septimus*, in which George Arliss starred. This was followed by a period as leading woman with the late Holbrook Blinn (1872-1928), in *The Boss*. She was the first actress to play the part of Mary Turner in *Within the Law*, in Chicago, in which Jane Cowl made one of her greatest successes in New York. Subsequently Miss Stevens appeared as leading woman in a succession of plays, among them being *To-day*, *The Garden of Paradise*, *The Unchastened Woman*, *The Gentle Wife*, *Foot-Loose*, *Hedda Gabler*, *The Fugitive*, and *Fata Morgana*. Her greatest popular success was in *The Unchastened Woman*. Some of her plays failed to win popular approval, but her own acting was invariably convincing and successful.

STEVENS INSTITUTE OF TECHNOLOGY. A non-sectarian institution for the technical education of men, at Castle Point, Hoboken, N. J., founded in 1870. The enrollment for the autumn of 1928 was 476 and for the summer session of the same year, 88. There were 51 members on the teaching staff. The productive funds amounted to \$2,764,000, and the income for 1927-28 was \$321,000. The library contained about 19,000 volumes. During the year the Institute received \$66,000 in gifts. Dr. Frank L. Sevenoak, acting president, following the resignation in June, 1927, of Dr. Alexander C. Humphreys, retired Sept. 1, 1928. Harvey Nathaniel Davis, Ph.D., an alumnus of Brown University, and for nine years professor of mechanical engineering at Harvard University, was formally inaugurated as the third president of the Institute on November 23, at ceremonies attended by representatives of more than 100 colleges and universities, including 32 presidents, and 34 representatives of educational and scientific bodies.

STONE. The stone group of minerals was one of the few groups which was able to main-

tain during 1927 the rapid pace set in production in the years immediately preceding, reporting significant gains for the year, due to the demand for this commodity by the building and paving industries, according to the U. S. Bureau of Mines. The output of stone, exclusive of that manufactured into lime, cement, and abrasive materials, or crushed into sand, amounted to 136,345,260 short tons, valued at \$198,661,622, an increase of 10 per cent over the 1926 output of 124,496,360 short tons. The increases in quantity took place in stone sold for curbing, rubble, crushed stone, agricultural limestone, riprap, manufacturing industries, and miscellaneous uses, while the decreases occurred in stone sold for construction, monumental stone, paving blocks, flux, and refractory. Building stone sales of 32,104,200 cubic feet showed a decrease of 4 per cent over the previous year, and consisted of: 17,340,690 cubic feet of limestone, valued at \$18,820,045, largely from the Bedford-Bloomington district in Indiana; 6,397,830 cubic feet of granite, a decrease of 22 per cent over 1926; sandstone, 3,995,370 cubic feet, an increase in quantity of 19 per cent over the previous year; and marble, 2,823,790 cubic feet, valued at \$10,739,228, a decrease of 2 per cent in quantity.

There was a general increase in sales of street and road material, although there was a decrease in paving blocks of 2 per cent. Stone sold for curbing amounted to 4,862,580 cubic feet, with a valuation of \$4,939,716, an increase of 10 per cent in quantity. Crushed stone, amounting to 94,948,770 short tons, with a valuation of \$97,474,267, showed an increase of 15 per cent in quantity, the largest increase coming in sales for concrete and road work, 17 per cent, while that used for railroad ballast increased 5 per cent.

The total value of stone imported into the United States for consumption in 1927 was \$4,536,407. Of this amount, \$2,521,917 represented the value of 958,429 cubic feet of marble, breccia, and onyx, as compared with a valuation of \$1,783,767 for 863,219 cubic feet imported in 1926. Total stone imports in 1926 were valued at \$3,523,578. Total exports of stone in 1927 were valued at \$2,094,585, divided as follows: Marble in blocks, rough or dressed, and other building stone, \$1,977,949, and other manufactures of stone, \$1,005,636. These figures compare with a total valuation of \$1,583,245 in 1926, divided as follows: Marble in blocks, etc., \$689,115, and various other manufactures of stone, \$896,130.

STONE AGE. See PHILOLOGY, MODERN.

STORMS. See METEOROLOGY.

STRAITS SETTLEMENTS. A British Crown colony in Malaysia, consisting of Singapore, Penang (with Province Wellesley and Dindings), and Malacca. The area is approximately 1600 square miles; population, according to the census of 1921, 883,769; estimated in 1926, 1,003,754. The estimates for the various parts in 1926 were as follows: Singapore, 217 square miles, with 502,021 inhabitants; Penang (with Province Wellesley and Dindings), 280 square miles, with 323,638 inhabitants; Malacca, 720 square miles, with 178,095 inhabitants. In 1926 there were 348,593 immigrants from China and 174,795 from southern India. The movement of population in 1926 was: Births, 33,694; deaths, 32,633. The seat of the Government is Singapore. In 1926 there were 274 schools (all government-aided), with an enrollment of 41,120 and an average attend-

ance of 38,332. The chief interest is commerce, mostly transit trade (the ports are free from customs duties). The centre of trade is Singapore.

The trade of the Straits Settlements during 1926 was as follows: Singapore, imports, £120,467,625, exports, £103,760,924; Penang, £40,634,036 and £37,440,920; Malacca, £6,003,461 and £8,636,497; Labuan, £358,563 and £395,680; Christmas Islands, £63,592 and £230,231; and Dindings, £131,792 and £491,498. The chief imports in that year, according to values, were: Para rubber, tin ore, rice, cotton piece goods and yarns, tobacco, cigars and cigarettes, vegetables and fruits, dried and salted fish, and sugar. The chief exports, also according to values, were Para rubber, tin, copra, pepper, and preserved pineapples. The budget for 1928 called for expenditures of 38,950,949 Straits dollars as against 32,916,545 for revenues. The anticipated deficit was attributable to extraordinary expenses on public works, which were expected to require over 7,000,000 dollars. The total number of merchant vessels entered at the ports of the colony during 1926, exclusive of native craft, was 11,898, with a tonnage of 18,979,478. The number of native craft was 31,272, with a tonnage of 1,113,737. Merchant vessels cleared, 1918, with a tonnage of 19,049,152; native craft cleared, 31,708, with a tonnage of 1,125,853.

The administration is under a governor, aided by an executive council of official members and a legislative council of official and unofficial members, the latter being nominated or selected by the chambers of commerce of Singapore and Penang. Governor in 1928, Sir Hugh Clifford, who is also High Commissioner for the Federated Malay States and Brunei, and British Agent for North Borneo and Sarawak. Under the administration of the Straits Settlements are the Christmas Islands, annexed in 1900, Cocos or Keeling Islands, annexed in 1903, and the colony of Labuan, annexed Jan. 1, 1907. See CHRISTMAS ISLANDS.

STRATHCLYDE, strāth'clīd, ALEXANDER URE. British jurist, former Lord Justice of Scotland, died at Cairndhu, Helensburgh, Scotland, October 2. He was born at Glasgow, Feb. 24, 1853, and after studying at Glasgow and Edinburgh universities he was called to the bar in 1878. He became a lecturer on constitutional law and history at the former institution in the same year, retaining that position for ten years. He was defeated as a Liberal candidate for Parliament from West Perthshire in 1892, and from Linlithgowshire the following year, but was elected by the latter constituency in 1895, serving until 1913. Having been appointed Solicitor-General of Scotland in 1905, Lord Strathclyde was made Lord-Advocate, in 1909. He became Lord President of the Court of Session, and Lord Justice-General in 1913, positions which he held until 1920, being of assistance to the Asquith administration through his knowledge of the land question. Besides being a King's Counsel, he was made a Privy Councillor, 1909, and was created Baron, 1914, and a Knight of the Grand Cross of the Order of the British Empire, 1917.

STRIKES AND LOCKOUTS. Mention has been made in the YEAR BOOK before of the ef-

ports of the U. S. Bureau of Labor Statistics to collect complete data on industrial disputes. The table that follows, reprinted from the *Monthly Labor Review*, presents the industrial disputes that began in and were in effect at the end of each month from January, 1927, to June, 1928. These figures were collected from newspapers, trade journals, and personal visits. There is no machinery in the United States for the compulsory reporting of strikes and lockouts.

THE BITUMINOUS COAL STRIKE. On July 18 the United Mine Workers abandoned the Jack-

sonville scale as a basis for negotiations and permitted to each of the districts the right to effect whatever wage agreements they could. In this fashion, with the complete defeat of the miners, ended one of the bitterest industrial conflicts since the World War. It will be recalled that the United Mine Workers had called the strike in the central competitive field, on Apr. 1, 1927, to enforce the Jacksonville scale which the operatives were seeking to abandon in view of the ruinous competition being offered by the non-union fields of West Virginia and Kentucky.

INDUSTRIAL DISPUTES IN THE UNITED STATES FROM JANUARY, 1927, TO JUNE, 1928

Month and year	Number of disputes		Number of workers involved in disputes		Number of man-days lost during month
	Beginning in month	In effect at end of month	Beginning in month	In effect at end of month	
January, 1927	37	18	5,915	2,287	58,125
February, 1927	65	45	9,756	5,717	115,229
March, 1927	74	67	13,142	8,182	214,283
April, 1927	87	88	202,406	199,701	5,265,420
May, 1927	107	116	22,245	200,702	5,136,006
June, 1927	80	88	18,957	196,323	4,863,845
July, 1927	65	63	33,994	199,287	5,308,123
August, 1927	57	53	8,150	198,444	4,999,751
September, 1927	57	58	12,282	196,829	4,945,702
October, 1927	50	58	13,024	82,095	2,724,117
November, 1927	27	51	5,282	82,607	2,040,140
December, 1927	28	54	4,281	81,229	2,129,153
January, 1928	43	62	18,263	81,676	2,135,092
February, 1928	47	61	33,602	104,883	2,155,559
March, 1928	34	63	7,145	78,362	2,343,415
April, 1928	62	70	143,834	134,382	4,884,430
May, 1928	72	74	15,138	136,094	3,526,608
June, 1928	40	64	20,941	134,406	3,580,719

sonville scale as a basis for negotiations and permitted to each of the districts the right to effect whatever wage agreements they could. In this fashion, with the complete defeat of the miners, ended one of the bitterest industrial conflicts since the World War. It will be recalled that the United Mine Workers had called the strike in the central competitive field, on Apr. 1, 1927, to enforce the Jacksonville scale which the operatives were seeking to abandon in view of the ruinous competition being offered by the non-union fields of West Virginia and Kentucky.

By midsummer the coal mines of Indiana, Illinois, and Iowa were withdrawn from the struggle on the basis of the acceptance of the Jacksonville scale, with the result that the miners of Pennsylvania and Ohio were left to fight the battle of the union against an unusually determined group of employers. The striking miners, who were the recipients of strike benefits of two to five dollars weekly, had the support of the anthracite miners and the general financial assistance of the American Federation of Labor. The industrial war was carried on with the weapons that society has learned to expect in such disputes. Miners were evicted from their homes, injunctions were obtained from the courts to prevent assemblage and picketing, and armed guards and agents menaced the strikers.

On Apr. 1, 1928, a minority group in the union held a convention and organized the Save-the-Union Movement. The movement, which was under the leadership of John Brophy, pointed out that the United Mine Workers had weakened the whole strike by permitting the Illinois and Indiana miners to withdraw, had not resolutely enough fought the issuance of injunctions, maintained picket lines, etc. The Save-the-Union Committee appealed to the Illinois miners to join the strike once more. The coal and iron police

announced the formation of the National Miners Union. However, in September, when the newly formed union attempted to meet in Pittsburgh, it was not given police protection; a large number of delegates were beaten up and the convention was made to terminate by the sheriff of Allegheny County, who declared that no meetings of National Miners would be permitted in Pittsburgh.

In 1922 the United Mine Workers had 500,000 members; it was computed that in 1928, at the end of the strike, only 100,000 members were left. How disastrously the strike had ended may be seen from the fact that the miners of Illinois were compelled to accept a wage scale of \$6.10 (they had won the Jacksonville scale of \$7.50 in 1927), the Pennsylvania miners had to accept a scale of \$5 as did also the Ohio miners. The miners were completely under the thumbs of the operators with the spread of the open shop and the presence of a surplus of 100,000 miners.

OTHER STRIKES. A strike involving 6500 persons was begun in *Haverhill*, Mass. among the *shoe workers* on January 19 as a result of an attempted wage cut by the employers. The stoppage succeeded in tying up all the shoe plants of the city. The strike was settled in ten days with the wage scale of the previous year restored. On February 20 there broke out in *New York City* a strike that involved some 25,000 workers in *cleaning and dyeing* establishments, as well as the proprietors of about 15,000 retail stores. The purpose of the strike was the stabilization of the industry and the ending of cutthroat competition. The strike ended officially on March 10 with the employees generally successful. On February 29, the *paper-box* makers of *New York City* went out on strike for union recognition and a standard weekly wage. About 1500 workers were in-

volved. Though the workers had the sympathy of the public, the strike did not end successfully for the operatives in view of the fact that the drivers made a settlement with their employers, in which they surrendered their chief demands, just as victory seemed assured.

On April 16, the *cotton textile* operatives of *New Bedford*, Mass., called a general strike in reply to an announced wage reduction of 10 per cent. The workers refused to postpone their strike vote when the manufacturers promised to put off the wage cut and 25,000 operatives went out in 25 plants. Only one-third of the strikers were reported to be unionized. After a terrible struggle of 25 weeks, on October 6 the unions voted to return to the shops with a wage cut of 5 per cent but the promise of a 30 days' notice of future wage reductions. All attempts at arbitration had failed including one based on a scheme for speeding up production with more pay guaranteed. This the workers had rejected, insisting that the *sine qua non* of arbitration had to be the restoration of the former salary scale. The strike received the support of the United Textile Workers of America.

In *New York City*, on April 3, approximately 2000 union *barbers* went on strike for higher wages. By May 25 all the master barbers had given in and the strike had been won. Some 1500 granite *quarrymen* of *Maine*, who went out on strike April 2, for an increase of 5 cents per hour, settled with their employers at a wage increase of 2 cents an hour, the signing of an agreement for three years and the fixing of a 44-hour week with a half-day on Saturday. May 16 saw about 1000 *dental workers* employed in the mechanical dental laboratories of the metropolitan district of *New York* go out on strike for wage increases, extra pay for overtime, minimum wage scale of \$25 weekly, and a 44-hour week. The workers formed a new union, Dental Laboratory Workers' Union. The strike was not successful. During May the *oil refining workers* of *Bayonne* successfully struck for the improvement of working conditions. Some 2100 *union carpenters* of *Buffalo* were out on strike June 1 to June 7 and were successful in their demand for higher wages.

On June 10 about 465 *artist's models and manikins* went out on strike in *Chicago* for more wages, better working conditions, and decent environment. The strike ended successfully in two days. A five-hour day was established with a rest period of 15 minutes in each hour. Wages were fixed at \$3 per hour. The *collar makers* of *Troy*, N. Y., some 1000 strong, struck on July 9 because of a disagreement as to a method of pay. A compromise was effected by which the piece-rate method of pay was retained. The workers reported to their benches each day but refused to turn a wheel.

CANADA. Reports from Canada indicated a state of industrial peace very much similar to that existing in the United States. For example, in 1927 the time lost in strikes and lockouts was less than in any year after 1915 and the number of employees involved was less than in any year since 1916. No single strike in 1927 involved more than 5000 employees nor did any strike lose more than 50,000 working days. In 1927, there were 79 strikes in progress in which 22,683 workers were involved and in which 165,288 days were lost. This state of affairs may be compared with the year 1919 (the

stormiest since 1913) where 298 strikes involved 138,988 workers and in which the total number of days lost was 3,942,189 days. For 1913 the figures had been 113 strikes, 39,536 workers, and 1,287,678 days lost.

BUENOS AIRES. During 1927, the Department of Labor of Argentina reported, there were 56 strikes in the Federal capital in which 36,888 persons were involved. The number of days lost totaled 363,492 and the monetary loss was 2,087,730 pesos (the peso was worth 96.3 cents). The following industries were involved: Bakery workers (3500), dye workers (250), textile workers (600), boot and shoe workers (1053), woodworkers (591), metal workers (85), electricians (250), construction workers (621), paper-box workers (68), printing-trades workers (370), restaurant waiters (90), slaughter-house workers (10), chauffeurs (25,005), other transport workers (4395).

See also LABOR ARBITRATION AND CONCILIATION.

STRONG, BENJAMIN. American banker, died at New York, October 16. He was born at Fishkill-on-Hudson, N. Y., Dec. 22, 1872, and after attending public schools in Montclair, N. J. became a clerk in a New York bank. He was made secretary of the Atlantic, and of the Metropolitan Trust companies. Appointed to a similar position in the Bankers Trust Company, in 1904, he later became vice president, and in January, 1914, he was made its president. He was chosen to the first governorship of the Federal Reserve Bank of New York, on Nov. 16, 1914, and, serving as chairman of the open-market-investment committee, he led in the formation of the Federal Reserve policy, during the system's first difficult years at the time of the World War. Mr. Strong studied war finance in England in 1916, and after the United States entered the War, he conducted Liberty Loan drives. After 1918 he made frequent trips to Europe, in order to consult foreign bankers and to discuss international banking, especially as it concerned post-war currencies and exchanges. He was credited with initiating Federal Reserve Loans which were instrumental in stabilizing financial conditions in Poland, Germany, England, Belgium, Prussia, France, and Italy. Mr. Strong received the LL.D. degree from Princeton University in 1918, he was made a member of the French Legion of Honor in 1919, and Poland honored him with the highest rank in the Order of Polonia Restituta, in 1927.

STUART, LESLIE. (THOMAS AUGUSTINE BARRETT). English composer, died at London, March 27. He was born at Southport, England, Mar. 15, 1866. He showed early skill as an organist, and at fifteen sat at the manual in St. John's Roman Catholic Cathedral, Salford. He played here for seven years, and then for seven years more was organist of the Church of the Holy Name, Manchester. It was while playing in the church that the idea of his greatest success, *Florodora*, came to him, and he abandoned the organ in 1896 to go to London. There he wrote his first song, "Louisiana Lou," interpolated by Miss Elaine Terriss with success in *The Shop Girl*. Another song success was "Soldiers of the Queen," with a fine marching lilt that made it a great favorite with the men in the Boer War. "On the Road to Tipperary" was also a famous production of Stuart's. His comic operas, *Florodora*, *The Silver Slipper*, *The School Girl*, *The*

Belle of Mayfair, Havana, The Slim Princess, and Peggy, brought him fame and fortune, but he did not retain the latter and was adjudged a bankrupt in 1912. He declared that he had been ruined by song pirates. Mr. Stuart visited the United States in 1917 and 1921. For a few years preceding his death, he appeared in vaudeville, playing his own compositions.

SUDAN, ANGLO-EGYPTIAN. A territory in the Nile region of Africa, extending south from Egypt to British East Africa and the Belgian Congo; bounded on the east by the Red Sea, Eritrea, and Abyssinia, and on the west by French Equatorial Africa; under British authority. Area estimated at 1,014,400 square miles; population in 1926 estimated at 7,005,966. Capital, Khartum, with a population of 30,797; other cities, Omdurman, 78,624; Khartum North, 14,319. On Jan. 1, 1927, the elementary, vernacular schools numbered 88 with about 8200 pupils; there are also 11 primary schools with 1200 pupils.

The Sudan is the chief source of the world's supply of gum arabic. In 1926 the exports of this product amounted to 22,744 tons valued at £844,198. Another important crop is cotton, which competes with the best Egyptian and American product. The total area under cotton in 1926 was 208,539 acres, and the crop of 1926-27 was estimated at 130,000 bales (478 pounds each); that for 1927-28 at 110,000 bales. Other products include sesame, senna leaves and pods, ground-nuts, dates, hides and skins, salt, and gold. Of all the grain crops, the most important is durra, which is the staple foodstuff of the inhabitants. In an average year the production of this cereal reaches almost 200,000 tons. Large quantities of ivory are exported and a large quantity of meat is supplied to Egypt each year. In 1925 there were in the Sudan approximately 20,500 horses, 345,000 asses, 2000 mules, 1,500,000 cattle, 5,250,000 goats and sheep, and 418,150 camels. Imports in 1927 totaled £E6,155,310 and exports and reexports £E5,229,420. Great Britain easily leads in Sudan's foreign trade, buying over three-fourths of its exports and supplying nearly one-third of its imports.

The budget estimates for 1927 balanced at £E5,660,000. The total length of railway open to traffic is approximately 1728 miles, and there is regular service by government passenger and cargo steamers for about 2500 miles on the Nile and its tributaries. Under a convention signed at Cairo, Jan. 19, 1899, the region south of the 22d parallel of latitude is administered by a governor-general appointed by the Egyptian Government with the assent of Great Britain. The Sudan has been divided into 15 provinces, each under a governor. Since 1910 the governor-general has been assisted by a council. The Governor-General in 1928 was Sir John L. Maffey.

SUDERMANN, zoo'dër-män, HERMANN. German dramatist and novelist, died at Berlin, November 21. He was born at Matzicken, East Prussia, Sept. 30, 1857, and studied at the universities of Königsberg and Berlin, specializing in

history, philology, and literature. After completing his formal study, he undertook the editorship of a political weekly in Berlin, but before long decided that his opinions were too radical for the paper, and resigned. Having already published several short stories, he determined to live by writing, and started what he later called his "bread-and-cheese existence," during which he wrote a moderately successful book of short stories, *Im Zwielicht*. He published *Frau Sorge* in 1887, a tale of duty and of romance, which was translated into English as *Dame Care*, and subsequently ran into more than one hundred and twenty-five editions. His first play, *Die Ehre*, produced in Berlin in 1889, brought him immediately to world-wide attention by its satirical attack on the affectations of current society. After his first successes, Sudermann wrote: the comparatively realistic novel, *Der Katzensteg*, which was translated under the title of *Regina*; an amusing short story of bourgeois life, *Iolanthes Hochzeit*; and a novel of moral psychology, *Es War*. He devoted himself chiefly, however, to his most effective form, the drama.

Sudermann's plays, which were produced in many countries, were rendered more memorable by such actresses as Sarah Bernhardt, Helena Modjeska, and Eleonora Duse. They include the sensational piece, *Sodoms Ende* (1890); and what has been considered Sudermann's greatest play, *Heimat* (1893), translated as *Magda* (1895). This was followed by the inferior *Die Schmetterlingsschlacht* (1894); and the striking but disagreeable play, *Das Glück im Winkel* (1895). He then wrote, in 1896, three single acts called *Moritur*, and a popular one-act play, *Fritzchen*. These were followed in 1898 by a realistic interpretation of the story of St. John the Baptist, *Johannes*, and an ethical mystery, *Die drei Reiherfedern*.

Sudermann was acclaimed for his powerful depictions and accomplished technique and, with Gerhart Hauptmann, was recognized as significant in the development of modern German literature. His protests were against conventional, artificial standards, and as society grew less restricted Sudermann's problems were solved and forgotten. His later plays, therefore, were socially less important than his earlier, critics having marked the change with *Die drei Reiherfedern*. It is a matter of debate whether those written after 1898 suffered or were improved by having less bombastic theses. The best known are *Johannisfeuer* (1900); *El lebe das Leben* (1902); *Der Sturmgesele Sokrates* (1903); *Das Blumenboot* (1904), produced 1906; *Stein unter Steinen* (1905); a group of plays called *Rosen* (1907), comprising *Die Lichtbändü*, *Margot*, *Der letzte Besuch*, and *Die ferne Prinzessin*; another collection of one-act plays, the *Strandkinder* (1909). *Der Bettler von Syrakus* (1909); *Die Lobgesänge des Claudian* (1913); and *Die gutschnittene Ecke* (1916).

It is thought that Sudermann's post-war writings suffer from his lack of sympathy with altered conditions. Several, however, are noteworthy, including: a dramatization of *Der Katzenschen* (1917); *Das deutsche Schicksal* (1921), three plays with the titles, *Heilige Zeit*, *Opfer*, and *Notruf*; an autobiography, *Das Bilderbuch meiner Jugend* (1922), *Wie die Träumenden* (1923); and *Der tolle Professor* (1926), as well as histories of the drama and the novel.

SUEZ CANAL. The reports on Suez Canal traffic for 1927 showed unprecedented activity during the year, both in number of passages of ships, which amounted to 5,545, with a net tonnage of 28,962,000, and in the movement of merchandise which amounted to 29,524,000 gross tons. In comparison with 1926, these figures show a gain of 2,902,000 tons. Total transit and navigation receipts were 208,685,837.34 gold francs, or 11 per cent above the previous high record established in 1925. Practically all of the countries east of the Suez Canal contributed to the increase for 1927, with British India leading, as the source and destination of more than 9,000,000 tons net, or an increase of 1,267,000 tons, as compared with 1926. India was followed by China and Japan, the region of the Persian Gulf, Australia, Dutch East Indies, East Africa, and Siberia, in the order named. The five principal flags represented in Canal traffic which exceeded their previous high records were the British, with over 16,000,000 net tons; the Dutch with over 3,000,000 tons; the French with 1,807,000; the Italian with 1,514,000; and the Norwegian with 662,000 tons. The order of importance, however, of the principal flags represented in the canal was the British, Dutch, German, with 2,764,000 tons, French, and Italian. Of the total net tonnage of 28,962,000 passing through the canal, the north-south traffic accounted for 13,567,000, or an increase of 1,471,000 tons, as compared with 1926, and the south-north traffic amounted to 15,398,000 tons, or a gain of 1,431,000 tons, the increase amounting to 2,920,000 tons, with the greatest percentage increase taking place in the north-south traffic as compared with figures for the previous year.

The accompanying table gives the commercial statistics by flags for Suez Canal traffic during the year ending Dec. 31, 1927:

SUEZ CANAL TRAFFIC *

Flag	No. of Transits	Net Tons
American	111	915,269
Argentinean	1	1,777
Belgian	24	131,591
British	3,085	22,937,110
Czechoslovakian	1	1,834
Danish	65	389,444
Dutch	575	4,173,380
Ecuadorian	2	4,538
Egyptian	4	6,234
Finnish	2	10,003
French	343	2,612,822
German	529	3,840,183
Greek	66	261,672
Italian	332	2,085,925
Japanese	152	1,241,315
Jugo-Slavian	7	37,940
Norwegian	142	890,796
Portuguese	1	7,355
Russian	13	81,037
Siamese	1	1,066
Spanish	11	44,500
Swedish	72	443,444
Turkish	6	8,472
Total	5,545	28,962,000

* Compiled from Suez Canal *Bulletin*, Feb. 25, 1928, for all ships passing through the Canal during 1927.

Upon comparing the gross tonnage of merchandise carried through the Canal for 1925, 1926, and 1927, it is found that the 1927 total was 29,524,000 tons, or 2,946,000 tons in excess of the previous high record set in 1925, but 4,105,000 tons in excess of 1926 tonnage. East-bound (north-south) traffic made a gain of 13 per cent, or approximately 1,300,000 tons and con-

sisted of such commodities as metals and machinery, railroad materials, coal, cement, salt, fertilizers, textiles, petroleum, wood pulp and paper, and refined sugar. Metals and machinery were consigned principally to India, Japan, the Dutch East Indies, and China; railroad materials showed a marked increase chiefly in the case of consignments to India and East Africa; and the increase in petroleum shipments came from Russia, while Rumanian petroleum showed a considerable decrease as compared with 1928. Among the leading commodities in the west-bound (south-north) traffic were cereals, amounting to 3,417,000 tons, or a gain of 1,327,000 tons; mineral oils, 3,158,000 tons; oleaginous products, 3,138,000 tons; textiles, 1,864,000; rubber; tea; sugar cane. There was also a marked increase in the amount of wheat shipped from Australia through the Canal; Persia figured prominently in shipments of mineral oil; and Vladivostok and Dairen accounted for the gains made in oleaginous products.

An interesting feature of the canal traffic in 1927 was the increasing importance of motor-vessel navigation, which rose to 3,585,000 tons net, corresponding to 12.3 per cent of the total transits, an increase of 1,063,000 tons over 1926. The number of motor vessels engaged in navigation through the Canal in 1927 was 639, or a gain of 184 over the previous year, the greatest tonnage registered by a motor ship making the transit being that of the *Asturias*, a new English vessel of 17,172 tons net which was on a tourist cruise.

Passenger traffic for 1926 and 1927, as classified below, shows a gain of 53,886 for 1927, the largest gain being made in north-south passages:

	1926	1927
Military:		
British	36,575	65,660
French	19,749	25,524
Italian	16,217	15,428
Dutch	320	374

SUGAR. The world production of sugar for the season 1928-29, as estimated by Willett and Gray, was 26,600,600 tons, compared with 25,277,916 tons in 1927-28, and 23,733,172 tons in 1926-27. The expectation, therefore, was for a crop for 1928-29 nearly one and one-third million tons larger than for the preceding year. Of the total production, 17,567,600 tons was from sugar cane and 9,033,000 tons from sugar beets.

The estimated production of sugar from cane by the leading countries was as follows: Louisiana, 150,000 tons (more than double that of the preceding year); Porto Rico, 620,000; Hawaii, 830,000; Virgin Islands, 7500; Cuba, 4,900,000; British West Indies, 227,000; French West Indies, 65,000; Santo Domingo, 345,000; Mexico, 170,000; Central America, 92,000; Brazil, 675,000; Argentina, 365,000; Peru, 345,000; Demerara, 109,000; other South American countries, 57,400; British India, 2,900,000; Java, 2,944,200; Formosa and Japan, 750,000;

Philippine Islands, 675,000; Australia, 530,000; Fiji Islands, 108,000; and all Africa, 686,500.

The estimated production of sugar from beets was: United States, 925,000 tons (refined); Canada, 33,000 (refined); Germany, 1,725,000; Czechoslovakia, 1,050,000; Austria, 110,000; Hungary, 210,000; France, 860,000; Belgium, 260,000; Holland, 310,000; Russia and the Ukraine, 1,380,000; Poland, 700,000; Sweden, 160,000; Denmark, 165,000; Italy, 380,000; Spain 238,000; Great Britain and Ireland, 223,000 (refined); Jugo-Slavia, 127,000.

The area in sugar beets in the United States declined about 75,000 acres compared with the preceding year, and the production of beets fell off correspondingly. Curly-top disease, transmitted by the sugar-beet leafhopper, continued to be a serious menace, but encouraging progress was reported in the development of varieties resistant to the trouble. The Louisiana cane crop occupied an area of about 157,000 acres compared with 90,000 acres the preceding year. The crop showed a high sucrose content, well above 13 per cent, and running up to over 15 per cent, indicating a yield of about 180 pounds of sugar per ton of cane. The tonnage yields also were high, the combined result being a sugar production twice that of the preceding season. Much of the improvement is attributed to the introduction of new varieties of sugar cane, although the need remains for developing varieties more resistant and better adapted.

Following the conclusion that New Guinea was the native home of sugar cane, the U. S. Department of Agriculture sent an expedition, headed by Dr. E. W. Brandes, to search the wilds of that country for disease-resistant varieties. A large amount of material was secured which will be tested and used for breeding.

After several years of trial, Cuba decided not to continue in 1929 the restriction of the harvested sugar area. Doubt was expressed as to whether the regulation of the crop had been of any benefit. It did not have the effect of raising prices to a level satisfactory to the producers of sugar; but, on the other hand, unrestricted production might have been accompanied by still lower prices. Many of those opposed to the official limitation of production believed that a strong, centralized marketing organization was needed and urged maintenance of the Sugar Export Corporation.

Negotiations looking to a plan for restricted sugar production by leading countries failed because of the attitude of Cuba and Java. This led to the cancellation of the International Conference originally announced for October. See **CHEMISTRY, INDUSTRIAL**; and for sugar analysis, see **CHEMISTRY, under Analytical Chemistry**.

SULPHARSENIDE. See **CHEMISTRY, under Mineralogical Chemistry**.

SULPHUR. The production of sulphur in the United States in 1928 amounted to 1,981,873 long tons, a decrease of 6 per cent from 2,111,618 tons produced in 1927 as reported by the U. S. Bureau of Mines after a canvass of the various producers. The shipments in 1928 amounted to 2,082,924 tons valued at approximately \$37,500,000 as compared with 2,072,109 tons valued at approximately \$38,300,000 in 1927. The stocks on hand at the mines decreased approximately 100,000 tons in 1928 and totaled about 2,000,000 tons on Dec. 31, 1928, the smallest amount since 1921. Texas, as usual, was the chief producer and

accounted for 99.88 per cent of the total production in 1928, and with the shipments of sulphur from stocks in Louisiana for 99.87 per cent of the shipments. Nevada and Utah reported larger shipments. The Texas production included that from two new properties, namely, those of the Union Sulphur Company at Wharton, and the Duval Texas Sulphur Company at Benavides. The average quoted price for sulphur throughout the year was \$18 a ton f. o. b. at the mines; while open prices were \$1 a ton higher, and the prices for sulphur for export was given as \$22 a ton at Atlantic ports. Sicily was next to the United States as a producer of sulphur in 1928, its output being estimated at about 250,000 tons or approximately the same amount as in 1927.

The exports of sulphur from the United States in 1928 totaled 685,051 long tons, valued at \$14,345,075, of which 159,644 tons went to Canada, 125,659 tons to Germany, 109,348 tons to France, 85,500 tons to Australia, 48,928 tons to The Netherlands, 44,098 tons to the United Kingdom, and 22,801 tons to New Zealand. The exports of sulphur in 1928 were less than in 1927, when they amounted to 789,274 tons, this amount being the highest ever recorded, with the exports for 1928 second. The exports of refined, sublimed, and flowers of sulphur increased from 31,419,221 pounds, valued at \$544,373 in 1927 to 44,536,508 pounds valued at \$706,766 in 1928. In 1928, 3938 long tons of sulphur and sulphur ore, practically all from Canada, were imported.

SUN. See **ASTRONOMY; PHYSICS**.

SUNDAY SCHOOL UNION, AMERICAN. A volunteer association composed of members of different denominations of the Protestant church, whose object is to establish and maintain Sunday schools and to publish and circulate moral and religious publications. It was established in 1817 as the Sunday and Adult School Union. Through the contributions of individuals, churches, and Sunday schools, it sustains missionaries and supports its general work, which is carried on by 13 districts. In the year ending Feb. 29, 1928, 781 schools were organized and 594 schools reorganized, with a total of 4426 teachers and 42,474 scholars. There were 194 Young People's societies; 152 preaching stations opened; 15 churches of various denominations organized; and 13 churches built. During 1928, the Union commissioned 201 missionaries, who, while exploring new territory or working in districts previously covered, visited 203,007 families in their homes and distributed 4,533 Bibles, 5,956 New Testaments, and 6,350 copies of the Gospel of St. John. The enrollment in teacher-training classes during the year was 536 and daily vacation Bible schools were held in 507 rural communities, with an enrollment of 13,923 pupils. The income for the year ending Feb. 29, 1928, was \$598,629, and expenditures, \$575,045.

The Union publishes and circulates books and supplies needed by the schools and homes which it serves. The total number of books, booklets, maps, charts, and other Sunday school requisites issued during the year was 176,538. The Union circulated 12 Sunday school periodicals, weekly, monthly, or quarterly, for officers, teachers, and scholars to the number of 1,908,174 copies. The most important of the publications is the *Sunday School World*. The officers in 1928 were: President, E. Clarence Miller; vice presidents,

James M. Snyder, Barton F. Blake, and Robert L. Latimer; treasurer and recording secretary, John H. Talley; secretary of Missions, G. P. Williams; editor of publications, James McConaughy. National headquarters are at 1816 Chestnut Street, Philadelphia, Pa.

SUPERPHOSPHATE. See FERTILIZERS.

SURGEONS, AMERICAN COLLEGE OF. A college, or guild (not a teaching institution), organized in 1913 by some 500 surgeons of North America representing every branch of surgery. The object of the college is "to elevate the standard of surgery, to provide a method of granting fellowships in the organization, and to educate the public and the profession to understand that the practice of surgery calls for special training, and that the surgeon elected to fellowship in this college has had such training and is properly qualified to practice surgery." Membership is on the basis of merit only, and applicants for fellowship are examined with reference to professional ability and moral and ethical fitness. Each applicant must further submit one hundred case records, of which fifty must be complete records of major work which he himself has done and for which he was the responsible surgeon, while the remaining fifty are composed of case histories in abstract of major operations at which he was the responsible or assisting surgeon. The membership in 1928 had reached 8000 and included outstanding surgeons of the United States, Canada, and the Latin-American countries. The college, in 1927, owned property valued at \$1,100,000 and had an endowment fund of approximately \$800,000. The activities of the college are financed from initiation fees and yearly dues of the Fellows, augmented by outside contributions.

The organization sponsors clinics held at the annual meeting of the Clinical Congress of the American College of Surgeons, and miniature clinical congresses held in various States and provinces at which the work of local doctors is observed, scientific papers are presented, and questions of interest to the lay public discussed. The college in 1917 initiated a hospital standardization programme which set definite professional requirements as to organization, diagnostic facilities, and methods of procedure, and which provides for a careful annual survey of all hospitals with thirty-five beds and over. In 1917, when the first survey was made, of the 692 hospitals of 100 beds and over, only 89, or 12.9 per cent, were fully or conditionally approved. By 1927 there were 2,581 hospitals of 35 beds and over on the visiting list and of these, 1803, or 69.9 per cent, were fully or conditionally approved. The college maintains a library and department of literary research to further the standardization of literature on surgery and closely allied subjects, and to encourage the wider reading and study of scientific material.

The official journal of the College is *Surgery, Gynecology and Obstetrics*. Officers for 1928 were: President, Dr. George D. Stewart, New York City; president-elect, Dr. Franklin H. Martin, Chicago; vice presidents, Dr. John Chalmers Da Costa, Philadelphia, and Dr. Herbert P. H. Galloway, Winnipeg; and treasurer, Dr. Frederic A. Besley, Waukegan, Ill. Dr. Franklin H. Martin was director general of the college and Dr. Malcolm T. MacEachern and

Dr. Bowman C. Crowell, associate directors. The headquarters are at 40 East Erie Street, Chicago, Ill.

SURGERY. Any improvement in the direction of overcoming shock, whether traumatic or operative, should be mentioned under progress in surgery. In the *Journal of the American Medical Association* for June 9, 1928, Dr. Preston A. Wade of Dr. Gibson's surgical service at the New York Hospital, announced that the addition of insulin to the dextrose solution ordinarily used to antagonize shock appears to represent a decided addition to our resources. In 18 months it was used on 40 patients, of whom 18 suffered from traumatic, and 12 from post-operative, shock, the others representing an indeterminate group in which shock symptoms precede a fatal termination. The most striking improvement was seen in traumatic shock where nine patients responded permanently and four temporarily to the treatment, death supervening from causes other than shock. Of 12 cases of the post-operative type, five responded in a satisfactory manner. Other cases of shock did not benefit at all from the treatment, nor was a favorable result anticipated in ante-mortem shock. It is of course impossible to prove by figures that this treatment is superior to the older methods, but the character of the response is certainly more impressive to the beholder. Much depends on the seasonableness with which the injections are practiced. One unit of insulin should be added to 3 gms. of dextrose in 1000 cc. of infusion.

SURINAM. See DUTCH GUIANA.

SVALBARD. An arctic archipelago in the Eastern Hemisphere, area 25,000 square miles, formerly known as Spitzbergen. It comprises all lands between 10 and 35 degrees east longitude and between 74 and 81 degrees north latitude. By the Treaty of Paris, Feb. 9, 1920, it was placed under the full and absolute sovereignty of Norway. The principal islands are West Spitzbergen, usually called Spitzbergen. Northeast Land, Barents Island, Edge Island, Wiche Islands, Hope Island, and Prince Charles Foreland. Norway assumed control in 1925 and appointed a governor, who lives at Green Harbor with a small staff. As all industries are conducted on Spitzbergen, they are treated under West Spitzbergen.

SVEVO, ITALO. Italian novelist, died suddenly in September. Born Ettore Schmitt at Trieste, Dec. 19, 1861, he lived in his native city as a paint merchant, writing three novels under the pen name of Svevo, which anticipated the analytical methods of James Joyce, Marcel Proust, and Valéry Larbaud. As D'Annunzio's exuberant style dominated the literary taste of the period, Svevo's psychological novels, *Una Vita* (1893) and *Senilità* (1898), received little popular attention, although they were favorably reviewed. He next published, in 1923, *La Coscienza di Zeno*, which immediately attracted attention in Italy. His friend, Joyce, and others, then undertook to acquaint the world with Svevo's dialectic art, and his work had just commenced to provoke universal discussion at the time of his death. See ITALIAN LITERATURE.

SWARTHMORE COLLEGE. A non-sectarian institution for the higher education of men and women at Swarthmore, Pa., founded in 1864 by the Society of Friends. The 1928 autumn enrollment was 540 full-time students, of

whom 275 were men, and 265 women. The teaching staff numbered 70. The endowment and productive funds amounted to \$3,700,000. The library contained 60,000 volumes. Additions to the physical plant during the year included the completion of the Friends Historical Library and of the Bartol Research Laboratory of the Franklin Institute, devoted to research in physics. Appointments to the faculty included: Professor Lucius R. Shero as professor of Greek; Dr. Duncan Graham Foster, as assistant professor of chemistry; Trayer S. Anderson as assistant professor of history; and the return of Frederick S. Klees as instructor in English, after a year on the faculty of Brown University. At the Founder's Day exercises on October 27, several additions to the endowment funds were announced, including an anonymous gift of \$100,000. President, Frank Aydelotte, LL.D.

SWAZILAND, swä'ze-länd. A British protectorate in South Africa, situated north of Zululand, at the southeastern corner of the Transvaal; formerly under the South African Republic; controlled by the British Government acting through a high commissioner of the Union of South Africa. Area, 6704.6 square miles; population at the census of 1921, 112,838, of whom 2235 were Europeans. Capital, Mbabane. The inhabitants are largely of the Zulu type. The chief agricultural products are corn (the staple product), tobacco, millet, various vegetables, peanuts, and cotton. The mineral resources are considered rich, but are undeveloped. The revenue for 1926-27 was £92,090 and the expenditure £111,835. As noted above, the territory is under the administration of the High Commissioner for South Africa, but the local administration is under a resident commissioner.

SWEDEN. A Scandinavian kingdom in the extreme northwestern part of Europe, occupying the eastern and larger part of the Scandinavian Peninsula. Capital, Stockholm.

AREA AND POPULATION. The total area of Sweden is 173,154 square miles; the population, according to the census of 1920, was 5,904,489; estimated, Dec. 31, 1926, 6,074,368. The population per square mile in 1926 was 38.3. The movement of population in the same year was: Births, 102,368; deaths, 71,315; marriages, 38,339; immigrants, 5388; emigrants, 11,043, of whom 9693 migrated to the United States. Cities with more than 100,000 inhabitants at the beginning of 1927 were Stockholm, 453,332; Göteborg, 231,213; and Malmö, 116,827.

EDUCATION. Elementary education is free and compulsory between the ages of 7 and 14. In 1926 there were in the elementary schools, 26,669 teachers and 665,032 pupils. In the same year there were 77 public secondary schools, with 28,564 pupils; 53 people's high schools with 3457 pupils; two high and seven elementary technical schools with about 2800 pupils; military, navigation, agricultural, veterinary, and other special schools; besides institutions for deaf mutes and the blind. There are two universities, Upsala, founded in 1477, and Lund, founded in 1668. The former had 3084 students and the latter 2169 in the fall of 1926.

PRODUCTION. The population of Sweden is almost equally divided between the pursuit of agriculture and commerce and industry. In 1926 there were in Sweden 9,416,000 acres of arable land (9.3 per cent of the total land area),

2,280,000 acres of permanent meadows, and 60,74 acres of forests and pastures. The total value of the crops in 1926 was 1,172,281,000 crowns (\$313,602,000) and in 1927, 1,126,567,000 crown (\$302,032,000), of which the value of hay was 313,851,000 crowns (\$84,143,000); oats, 167,566,000 crowns (\$44,924,000); potatoes, 115,029,000 crowns (\$30,839,000). According to the last livestock census (1920), there were 2,736,000 cattle, 1,011,000 swine, 1,568,000 sheep, 113,000 goats, and 728,000 horses.

From the earliest times, mining has been the chief industry of Sweden, although in recent years wood and wood products have played an important part in the economic life of the country. In 1927 there were produced 9,661,004 tons of iron ore, 413,500 tons of pig iron, 486,900 tons of steel ingots, 398,000 tons of coal, 460,000 tons of cement, 1,558,000 tons of chemical wood pulp (1,450,000 tons for 1926), 61,000 tons of cardboard and paper, 184,358,000 cigars 42,500 tons of margarine, and 20,975 tons of cotton yarn. In 1926, 406,691 persons were engaged in industrial activities, distributed as follows: Mines and metals, 118,970; non-metallic minerals, 41,749; wood and wood manufactures, 57,998; paper and printing, 51,854; foodstuffs, 43,060; textiles and clothing, 53,435; leather and rubber, 18,888; chemicals, 14,391; and electric and gas plants, 6346. The total value of all industrial products in that year was \$1,179,741,000.

COMMERCE. Swedish foreign trade reached record quantity figures during 1927 and was exceeded in value only during the abnormal years 1919 and 1920. Imports and export values, as compared with 1926, increased 6.5 per cent and 14 per cent, respectively. Average import prices, principally by reason of mineral oils and coal, dropped about 10 per cent as compared with 1926, while the reduction in export prices was only about 3.3 per cent. Imports of animal feedstuffs were less than in 1926, while increases were noted in cereals, fruits, textiles, ships, coal and coke, iron and steel, machinery, automobiles, and numerous other items. Practically all exports showed increases, especially animal feedstuffs, hides and skins, lumber, pulp and paper, ships, iron ore, iron and steel manufactures, and machinery. The most marked change geographically was the increase of exports to Germany, which advanced almost 50 per cent, largely because of unusually heavy shipments of iron ore. Swedish imports from the United States were substantially the same as in 1926, while exports to the United States increased slightly over the previous year. The total value of exports in 1927 was 1,616,583,000 crowns (\$433,406,000); of imports, 1,584,364,000 crowns (\$424,768,000). On the basis of the returns for the first half of 1928 it appeared that there would be a marked increase in Swedish imports during the entire year and a more or less sharp decrease in exports, the latter being due to industrial troubles in the metal and wood industries.

FINANCE. The approved budget for the fiscal year 1928-29, which was passed by the Swedish Parliament on June 6, balanced at 744,746,400 crowns. This was an increase of 10,663,700 crowns over the estimated budget and 34,019,200 crowns over the budget for the fiscal year 1927-28. Of the increase in the voted budget, 9,000,000 crowns came under "Expenditure for

increase of capital," and 1,600,000 crowns under "Current expenditures." On the revenue side there was a decrease of 8,500,000 crowns in dividends accruing to the State from shares in the mining company, and income from taxes has been augmented by 10,250,000 crowns. Furthermore, "Loans" were increased about 8,600,000 crowns, as compared with the 1927-28 budget. The Swedish national debt on Dec. 31, 1927, was 1,816,000,000 crowns, of which 1,797,000,000 crowns represented funded debt and 19,000,000 floating debt.

COMMUNICATIONS. The length of railway line at the end of 1927 was 10,110 miles, of which 3877 miles were State owned and 6233 miles were owned by private companies. The mileage of the Swedish State Railways showed a small increase of 120 kilometers at the end of 1927, bringing the total mileage up to 6153 kilometers, as compared with 6033 at the end of 1926. Earnings and expenses of the State Railways during 1927 were as follows: Gross earnings, \$52,310,000; total expenditures, \$42,639,000; net earnings, \$9,671,000; income from passenger traffic, \$16,989,000; income from freight traffic (exclusive of iron ore), \$26,455,000; freight earnings on iron ore, \$5,468,000. The number of passengers carried increased from 27,915,000 in 1926 to 28,298,000 in 1927, and the quantity of goods transported (exclusive of iron ore) expanded from 9,972,000 metric tons to 10,054,000 metric tons. The quantity of iron ore carried in 1927 aggregated 7,456,000 metric tons, as compared with 6,389,000 tons in 1926.

The number of tourists in Sweden in 1928 was considerably above the 1927 total, and it was estimated that the total revenue obtained from this source in 1928 would exceed appreciably the 1927 total of about 30,000,000 crowns (\$8,043,000). The estimated income from tourist expenditures in 1927 approximated 2 per cent of the total value of the exports of merchandise from Sweden during that year. Only 9 of the 25 leading groups in that export schedule reached a higher total than tourist expenditures.

During 1927, 29,791 vessels of 16,253,000 net tons entered the ports of Sweden and 29,772 of 16,235,000 net tons cleared. The Swedish merchant marine in the same year consisted of 1371 vessels of 1,365,390 tons. The total income of the Swedish merchant marine during 1927 amounted to 294,603,000 crowns, as against 278,188,000 in 1926, an increase of about 6 per cent.

GOVERNMENT. Executive power is vested in the King, who acts through a responsible ministry known as the Council of State, at the head of which is the Minister of State, or Premier; legislative power is in the Diet of two chambers, of which the Upper has 150 members elected by the legislatures of the provinces; the Lower Chamber consists of 230 members elected for four years by universal suffrage. The King in 1928 was Gustaf V, born June 16, 1858, who ascended to the throne on the death of his father, Oscar II, Dec. 8, 1927. The ministry was constituted as follows: Premier, Carl Ekman; Foreign Affairs, Eliel Löfgren; Justice, Johan Thyren; Defense, Gustav Rosen; Social Affairs, Jakob Pettersson; Communications, Carl Meurling; Finance, Ernst Lyberg; Education and Ecclesiastical Affairs, John Almkvist; Agriculture, Bo von Stockenström; Commerce, Felix Hamrin; Ministers without Portfolio, Sigurd Ribbing and Natanael Gärde.

HISTORY. Sweden was troubled throughout the year by a series of strikes in the wood-pulp and mining industries, which had a tendency to slow up production and trade during the entire year. The Government made several attempts to mediate but met with little success, particularly after the employers had adopted the lockout system to bring the workers to terms. The industrial unrest was particularly important in light of the elections to be held during the year, when a gain in a few more seats by the Socialists would enable them to get control of the Government and unseat the Moderates who controlled the legislature. However, when the elections were held in September, the returns indicated a loss of 16 seats for the Social Democrats, and gains by the Conservatives, Agrarians, and Communists. Although Premier Carl G. Ekman was reelected, his Minister of Foreign Affairs, J. E. Löfgren, was defeated, and the entire cabinet tendered its resignation as a result. A new government was formed under the premiership of Admiral A. Lindman. It had a decided conservative trend and consisted of a coalition of all the parties in the legislature with the exception of the Social Democrats and the Communists. See **ARBITRATION, INTERNATIONAL**.

SWEDENBORGIANS. See **NEW JERUSALEM, CHURCH OF THE**.

SWEDISH LITERATURE. See **SCANDINAVIAN LITERATURE**.

SWIMMING. Swimming had the greatest year in 1928 in the history of this sport, with the Olympic Games (q.v.) affording a fitting climax. Forty nations participated in the Olympics, the entries of the United States making practically a clean sweep in the various events. The Amateur Athletic Union competitions were marked by more than a hundred record-breaking performances, although a considerable percentage of these missed official recognition because of technicalities and other causes.

Miss Martha Norelius, of the Women's Swimming Association of New York City, led the way in establishing new time standards. Every international record in free-style swimming from 220 yards to 880 yards was bettered by Miss Norelius in the course of her long campaign. Miss Eleanor Garratti, of San Rafael, Calif., set a new world record of 1:10 $\frac{1}{2}$ minutes for the 100 meters in a 55-yard pool. John Weissmuller, of the Illinois A. C., lowered the world time for the 100 meters to 57 $\frac{1}{2}$ in a 110-yard pool. In back-stroke swimming, George Kojac, of New York, set a world 100-meter mark of 1:09 $\frac{3}{4}$ minutes in a 50-meter pool. Miss Lisa Lindstrom, of the Women's Swimming Association, and Miss Eleanor Holm, 14 years old, stood out among the women back-stroke swimmers.

Clarence Crabbe of Honolulu, and Miss Josephine McKim, of Homestead, Pa., distinguished themselves in mile tests. Edward Lee, of the New York A. C., and Miss Ethel McGary, of the Women's Swimming Association, captured the national long-distance championships. Among the American colleges, Yale and Michigan produced the strongest swimming teams, the former winning the dual meet with the Conference college by a "touch." In relay competition, Yale quartet lowered the free-style time for 400 yards at 3:39 $\frac{1}{2}$.

The winners in the United States senior outdoor championships for men were: 220 yards, back stroke, George Kojac, Boys' Club, New York,

2 minutes, 37½ seconds; 440 yards, free style, John Wiessmuller, Illinois A. C., 4 minutes, 58½ seconds; 880 yards, free style, Clarence Crabbe, Honolulu, 10 minutes, 29½ seconds; one mile, Clarence Crabbe, 21 minutes, 35½ seconds; 10-foot spring-board diving, Mickey Reilly, Los Angeles A. C.; plain and fancy high diving, Mickey Reilly; long distance, Edward Lee, New York A. C.

In the senior women's outdoor championships, the victors were: 440 yards, Martha Norelius, Women's Swimming Association, 5 minutes, 49½ seconds; 880 yards, Martha Norelius, 11 minutes, 56½ seconds; one mile, Josephine McKim, Homestead, Pa., 24 minutes, 49½ seconds.

SWINE. See **LIVESTOCK.**

SWITZERLAND. A federated republic of western Europe, comprising within its limits the ranges and peaks of the Alps and Jura Mountains. Capital, Berne.

AREA AND POPULATION. The area of Switzerland is 15,940 square miles; population, according to the census of 1920, 3,880,320; estimated Dec. 1, 1926, 3,959,000. In 1926 the estimated population of the principal cities was as follows: Zurich, 210,720; Basle, 139,560; Geneva, 126,000; Berne, 107,960. The movement of population in 1926 was: Births, 73,963; deaths, 48,297; marriages, 28,079; emigrants, 4947. Linguistic differences constitute the most important distinction among the various Swiss types. German is the language of 70.9 per cent of the people, French of 21.2 per cent, Italian of 6.2 per cent, and Romansch of 1.1 per cent. Dialects of the various languages spoken in Switzerland are numerous.

EDUCATION. According to the school statistics for 1925-26, there were 4407 primary schools, with 17,128 teachers and 491,289 pupils; 599 secondary schools, with 25,369 boys and 24,413 girls and 1776 men and 536 women teachers; 111 lower middle schools with 9446 boys and 5348 girls; and 693 men and 68 women teachers. For special education there were various commercial, technical, agricultural, and other schools. The seven universities of Switzerland, at Basle, Zurich, Berne, Geneva, Lausanne, Fribourg, and Neuchatel, are organized on the model of those of Germany, governed by a rector and a senate, and divided into four faculties of theology, jurisprudence, philosophy, and medicine. In 1926-27 the total number of students in attendance at these universities was 6526 and the members of the various teaching staffs numbered 977.

PRODUCTION. In 1926 there were in Switzerland 1,250,000 acres of arable land, or about 12 per cent of the total area; 4,141,000 acres of permanent meadow and pasture, 36,000 acres of trees, shrubs, and bushes, 2,225,000 acres of forests, 247,000 acres of uncultivated land, and 2,301,000 acres of unproductive land. In the same year there were 1,587,000 cattle, 635,000 swine, 169,000 sheep, 287,000 goats, and 139,000 horses. Dairying is the most important branch of agriculture. In 1927 the acreage and production of the principal crops were as follows: Wheat, 174,000 acres, 5,982,000 bushels; rye, 49,000 acres, 1,657,000 bushels; barley, 16,000 acres, 583,000 bushels; oats, 51,000 acres, 3,059,000 bushels; potatoes, 119,000 acres, 24,618,000 bushels; grapevines, 37,000 acres, 9,246,000 gallons of wine. The production of cheese in 1926 was 70,700 tons; of butter, 13,500 tons.

The principal manufactured products, with the percentage of exports to total production, are as follows: Watches and watch movements, 92 per cent; silk fabrics, 95 per cent; embroideries, 94 per cent; cotton yarn and fabrics, 60 per cent; dyes, 90 per cent; chocolate, 40 per cent; cheese, 67 per cent. The number of factories in operation in 1927 was 8163 as compared with 8123 in 1926.

COMMERCE. As an evidence of the extent to which Swiss products are more than holding their own in foreign markets, in 1927 their exports reached a value of 2,023,249,000 francs, or about 10 per cent more than in 1926, while imports valued at 2,563,794,000 francs, increased about 6 per cent. The unfavorable visible trade balance, to be made up by services, was 540,545,000 francs, or 38,000,000 less than the unfavorable balance of 1926. The charges for services have also increased, so that a much larger sum in the total balance of payments was left available for investment abroad. Only one category of imports—that of animals—fell greatly behind the 1926 figures, and this was the result of restrictive measures imposed by the Government. On the other hand, there were 19 articles whose import value were considerably above those of 1926, not because of higher prices but because larger amounts were brought in. Among exports, no item fell much below the 1926 values; instead, there was a very general increase, showing that some of the heavier imports of raw material were reexported in the form of finished goods. Germany provided 21 per cent of Swiss imports in 1927 and purchased almost 20 per cent of the exports. France was also a heavy supplier, followed by Italy, the United States, and Great Britain. Great Britain was second as a market for Swiss merchandise, followed by the United States, France, and Italy. Imports from the United States were valued at 22,000,000 francs, and exports to the United States at 209,600,000. Total exports in the calendar year 1928 were valued at 2,134,000,000 francs; imports 2,744,000,000 francs.

FINANCE. In estimating receipts and expenditures for 1928, Switzerland budgeted for another deficit, a situation which had occurred annually since 1913. Revenue for 1928 was estimated at 322,230,000 francs and expenditures at 331,550,000 francs. It was not the actual total of receipts and expenditures that disturbs the fiscal authorities so much as the fact that there was always a deficit, although resources are more and more heavily drawn upon each year and an effort is made to cut down normal running expenses. Any saving in this direction is at once offset, and even exceeded by the mounting total of expenditures resulting from beneficiary and paternalistic legislation.

Subsidies for sick insurance have increased from 3,999,000 francs in 1919 to a sum estimated at 7,060,000 francs in 1928, while over the same period accident insurance expenditures increased from 4,344,000 francs to about 6,300,000 francs, and expenditures for unemployment relief and insurance rose from 509,000 francs to an amount estimated at 2,500,000 francs. Old-age pensions, etc., and the fund for government employees had risen to 19,000,000 francs and 19,764,000 francs, respectively. In 10 years the outlays for these services had increased from 8,852,000 francs to 54,624,000 francs. None of the subsidies existed in 1913. An inevitable result of the continuing

deficits in the annual accounts was a slower rate of decrease in the national debt. At the end of 1926 the total debt was 4,832,279,000 francs, compared with 4,855,288,000 francs at the end of 1925. By the end of 1927 the total debt had exceeded that of 1926 and reached a total of 4,900,633,000 francs.

COMMUNICATIONS. The financial situation of the Federal Railways, which had been unsatisfactory since the War, was gradually improving. Receipts during 1927 were the largest yet attained, although expenditures were practically the same as in 1926. (See *YEAR BOOK* for 1927.) However, with the heavy charges incurred as a result of the electrification and other improvements, it was expected that the 1927 accounts might still show an unfavorable balance. The Federal Railways during 1927 operated 1828 miles of line, carried 111,025,000 passengers and 17,813,000 metric tons of freight, and had gross receipts of 395,525,000 francs (\$76,178,000). About 37 per cent of the system was electrified. The private railways have considerable mileage but much less traffic than those of the Government.

GOVERNMENT. Both executive and legislative power are vested in the Parliament of two chambers, the Council of State and the National Council, the first having 44 members elected by the cantons, two for each canton; the second has 198 members elected directly by the people. The two chambers united form the Federal Assembly, which is the supreme organ of government and delegates the chief executive authority to the Federal Council, whose seven members are elected for three years. The seven members of the Federal Council act as ministers for the departments of the Government. The chief magistrates are the President of the Confederation and the Vice President of the Council, and are elected by the Federal Assembly for one year. President in 1928, Edmund Schulthess; Vice President of the Council, Dr. Robert Haab.

HISTORY. The President of Switzerland for 1928 was elected on Dec. 31, 1927. The successful candidate was Edmund Schulthess, who had served in the capacity of chief magistrate in 1917 and in 1921. As a result of the general election held on October 28, the makeup of the legislature was left virtually unchanged. The Radical Democrats lost one seat and the Socialists gained one. The largest gain in the popular vote was made by the Socialists.

SYDNEY, AUSTRALIA, BRIDGE AT. See *BRIDGES*.

SYMPHONY CONCERTS. See *MUSIC*.

SYPHILIS. Dr. P. A. O'Leary of the Mayo Foundation reported in the *Journal of the American Medical Association* for Aug. 25, 1928, the results obtained from treating neurosyphilis with malarial inoculation. This plan of treatment goes back to 1924. The total number treated up to 1928 was 358, and of this number 220 showed the early manifestations of paresis, which leaves 138 so-called non-paretic cases. Of the first group, the author states that the so-called fever (malaria) treatment is superior to any other for bringing the disease to an arrest. The use of typhoid vaccine was not attended by such good results, but was much better adapted to practical requirements. Of the large non-paretic group, many cases of which were without symptoms and recognized only by serological tests, the author stated that he would first make use of the usual

drug remedies, but that if there was no satisfactory response he would at once make use of the fever treatment lest symptoms of paresis supervene. In general, the method was first the drugs arsphenamine, bismuth, and tryparsamide, and in reserve malarial inoculation and typhoid vaccine. Each of these resources may be said to have a definite province. In discussion, Dr. Stone (Cleveland) expressed his belief that the malarial treatment had made good wherever tested. Dr. O'Leary added that he believed we should prevent paresis as well as treat it with the fever therapy. See also *VENEREAL DISEASES*.

SYRACUSE UNIVERSITY. A non-sectarian institution for men and women at Syracuse, N. Y., founded in 1870. The 1928 autumn enrollment was 5430; the extension school enrollment was 2320; and the summer-session enrollment 1679. The faculty numbered about 590 for the year 1927-28. The productive funds of the university amounted to \$3,539,985, and the income for the year to \$1,824,953. The library contained 173,000 volumes and over 60,000 pamphlets. Continuing the programme of reorganization inaugurated in 1927, which resulted in changes in the law school and library school in that year, the reorganization of the college of home economics was completed in 1928; Dr. Annie Louise Macleod, formerly of Vassar College, was appointed as dean of the college, and associates were appointed from Cornell and Yale universities. In 1928 a teachers' pension system for all grades was adopted. Chancellor, Wesley Flint, D.D., LL.D., Paed.D.

SYRIA. Traditionally, the region lying between the Syrian Desert and the Euphrates River on the east and the Mediterranean on the west; and between the Taurus Mountains in the north and Egypt on the south; formerly a province of the Turkish Empire; in 1920 recognized as an independent state under a mandatory power, the mandate being bestowed upon France, Syria, under the mandate, is bounded by the Mediterranean on the west, by Palestine on the south, by Mesopotamia on the east, and by Turkey on the north. Since Jan. 1, 1925, the country comprises four territories: Syria, Alaouite, Great Lebanon, and Jebel Druze. The total area of the mandated region has been placed at 60,000 square miles, and the population in 1926 at 2,046,857. Arabic is the prevailing language. The great majority of the inhabitants being of Arabic stock, and in religion, Sunnite Mohammedan. The chief towns are Damascus, 170,000; Aleppo, 140,000; Beirut, 80,000; Homs, 60,000; Hama, 35,000. There were in 1927, 552 public elementary schools with 38,873 pupils. Various educational schools are maintained by the Greek Catholics, the Maronites, the British missionary societies, and Roman Catholic agencies. There is an American university at Beirut.

PRODUCTION. The year 1927 in Syria was one of general recovery from the depression of 1926. Foreign trade showed a marked expansion, agricultural returns were fairly satisfactory, and industries were active. Exchange improved and larger budget expenditures were anticipated for productive purposes. Preliminary data for 1927 indicated that the harvests were generally equal to those of 1926, though certain cereals, especially wheat, were reported to have fared less favorably than other crops. The fruit crops were better than in 1926, and the production of coconuts was estimated at 3200 metric tons as com-

pared with 3160 tons in the previous year. Reports of agricultural returns from the Damascus district were more favorable than from the other regions, owing to the more stable conditions in that territory. The planting of mulberry trees, many of which were cut down during the World War, continued at a satisfactory rate. Leading industries registered a general improvement over 1926, especially textiles in Aleppo and Damascus. The tanning industry also reported a more favorable year. Syria is primarily an agricultural country, but increased demand for the products of these small establishments is a favorable indication of the gradual return of the country to more stable conditions, following the unsettled period of 1925 and 1926.

COMMERCE. Foreign trade during 1927 showed a marked expansion over the previous year, but with a slightly larger adverse balance. Imports amounted to \$50,300,000, as compared with \$41,055,000 in 1926, an increase of 22.5 per cent; exports totaled \$21,486,000 against \$17,652,000, or 21.7 per cent increase. The increase in imports was accounted for principally by larger purchases of cotton and cotton goods, livestock, industrial oils, and metal manufactures. Increased shipments of cereals and olive oil were chiefly responsible for the better showing in exports. France displaced Palestine as the leading country of destination for exports and reexports, taking 15.8 per cent (14.7 in 1926) of the total; the United States was next, with 13.5 per cent (12.8); Palestine, with 13.3 per cent (16.7); and Egypt with 11.5 (15.3). France was again the chief source of imports, furnishing 15 per cent (19.9 in 1926) of the total; followed by England with 13.9 (13.6); Turkey with 9.6 (9.5); Italy with 9.4 (11); and the United States with 6.8 (7.3).

FINANCE. The budget for 1927 showed a balance of receipts and expenditures of 1,508,630 Syrian-Lebanese gold pounds (1 gold pound equals 20 gold francs); the total for the States under the mandate amounted to 2,775,790 Syrian gold pounds. For 1928 the budget of Syria was balanced at 2,343,608 Syrian gold pounds, the total for the mandated territory being 3,881,898 Syrian gold pounds. The increase over 1927 is accounted for by expenditures from special funds for productive purposes, especially along agricultural lines.

COMMUNICATION. Shipping statistics for 1927 showed a slight increase in tonnage over 1926. There visited Syrian ports in 1927 a total of 820 steam, and 2283 sailing, vessels of 1,830,363 aggregate tons as against 817 steam, and 2343 sailing, vessels of 1,768,744 aggregate tons in the previous year. There are about 500 miles of railways in the country.

GOVERNMENT. Syria is governed under a mandate of France granted by the League of Nations. High Commissioner in 1928, Henri Ponsot.

HISTORY. The outstanding event in Syrian history during the year was the attempt to draw up a constitution which would meet the needs of the natives and at the same time be satisfactory to the French Government. Provisions were made by High Commissioner Ponsot early in the year for holding an election for a Constituent Assembly which would draw up the new constitution. The Assembly met early in June and began its labors. The French High Commissioner in addressing the gathering stated that as soon as its work was done, France would sign a

treaty with the Syrian Government which would be to the mutual advantage of the two parties concerned. When some of the preliminary work on the constitution was completed, it was so unsatisfactory to the French High Commissioner that, he suspended the meetings of the body for a period of three months (August 12). He declared that the constitution which was being drawn up was merely a declaration of independence and was not at all in accord with the relationship of France and Syria under the terms of mandate given out by the League of Nations. When the three months' period was up, the High Commissioner suspended further meetings for another period of three months and thus the year closed without anything concrete being done to establish a native government in the country. It appeared that French imperialism and Syrian nationalism would simply not mix and that the turmoil of the last few years would continue.

TAIWAN, t'wän'. Official Japanese name for Formosa. See **FORMOSA**.

TALBOT, THE RIGHT REV. ETHELBERT. American clergyman, former presiding bishop of the Protestant Episcopal Church, died at Tuckahoe, N. Y., February 27. He was born at Fayette, Mo., Oct. 9, 1848, and was graduated from Dartmouth College in 1870 and from the General Theological Seminary, New York, in 1873. Shortly after his ordination as deacon, he was at the Church of the Transfiguration, New York, and then returned to his birthplace as rector of St. Mary's Church there. In a few months he went to Macon, Mo., as rector of St. James's Church and of St. James Military Academy, 1873-87. In the latter year he was consecrated as first Missionary Bishop of Wyoming and Idaho, and entrusted with the task of building up his church in a vast and undeveloped territory. It was the beginning of a work that lasted eleven years and brought fame to Dr. Talbot as a zealous pioneer-churchman and a man of deep human sympathy. He was one of the best-known men in the West. Owen Wister, novelist, used Bishop Talbot as the original of his character of the bishop in his widely read novel, *The Virginian*. During his service in Wyoming and Idaho, the missionary bishop supervised the building of about forty churches and helped to found a hospital at Wallace, Idaho, a cathedral at Laramie, Wyo., a girls' school at Boise, Idaho, and a boys' school at Laramie.

In 1898 Bishop Talbot was elected Bishop of Central Pennsylvania. In 1905 his diocese was divided, and he remained as Bishop of Bethlehem, Pa. On Feb. 15, 1924, he became, by succession, presiding bishop of the Protestant Episcopal Church. He was the last to occupy this office by succession, the Church having decided to choose the subsequent presiding bishops by election. He presided *ex officio* at the trial of Bishop William M. Brown, unfrocked for heresy in 1925. Bishop Talbot resigned from his bishopric Oct. 1, 1927. He won fame as a pulpit orator, and on visits to England preached in Westminster Abbey and St. Paul's Cathedral, London. Bishop Talbot received the degree of S.T.D. from the General Theological Seminary in 1887, that of LL.D. from the University of Missouri in the same year,

and that of D.D. from Dartmouth in 1888. His life in the West is described in *My People of the Plains* and in his other writings. They include *A Bishop Among His Flock*; *A Bishop's Message* and *Tim—An Autobiography of a Dog*.

TALBOT, HOWARD (real name, MUNKITTRICK). An English operatic composer, died in London, September 12. He was born in Yonkers, N. Y., Mar. 9, 1865, but taken, at the age of four, by his parents to London, where he later studied at the Royal College of Music under Sir Hubert Parry and Sir Frederick Bridge. From 1900 on he was conductor at various London theatres. Altogether he wrote some two dozen operettas, many of which enjoyed immense popularity in London. His outstanding successes are *A Chinese Honey-moon* (1899), *Three Little Maids* (1902), *The White Chrysanthemum* (1905), *The Belle of Brittany* (1908), and *The Arcadians* (1909).

TALC. In 1927 the United States Bureau of Mines reported a total production of talc amounting to 192,316 short tons valued at \$2,234,724. The greater part of this production was ground talc amounting to 185,116 tons valued at \$2,097,709. In addition, crude talc amounting to 5706 tons valued at \$25,365, and sawed and manufactured talc amounting to 1494 tons, valued at \$111,650 were included in the total. In 1927 there were imported 25,194 tons of talc, valued at \$550,382 of which 377 tons valued at \$27,326 were crude and unground steatite and French chalk; while 24,817 tons valued at \$523,056 were manufactures of talc (except toilet preparations wholly or partially finished). In 1928 the American short-fibre talc industry had a production slightly in excess of that for 1927 and new properties were being acquired and developed to compensate for mines which had been more or less depleted. Talc was being used as an ingredient of concrete mixture and as a core wash in casting operations. It was being employed experimentally to kill insect larvæ and was also used on the West coast of the United States in the manufacture of tile. Other uses were found in the roofing, paint, and rubber industries. Imports of talcum steatite and French chalk in 1928 amounted to 54,015,895 pounds, valued at \$576,454. In 1928 there were exported from the United States "talcum and other toilet powders" to the amount of 3,136,838 pounds, valued at \$1,605,630, being a slight decrease in quantity and value from the exports of 1927.

TANGANYIKA (tân'gân-yē'ká) **TERRITORY**. A territory under British mandate, comprising the portion of German East Africa assigned to Great Britain after the conquest of the country by British and Belgian soldiers during the World War. Area, about 373,500 square miles; native population (mainly of mixed Bantu race), according to the census of 1921, 4,107,000. The Europeans numbered 2447; Asiatics, 14,991, of whom about two-thirds were Indians. Capital, Dar-es-Salaam, with a population of 25,000. The capital and Tanga are the chief seaports. In 1926 there were 84 government schools, 2345 Roman Catholic schools, and 1254 Protestant schools, with a total roll exceeding 167,883 pupils.

The forest resources of Tanganyika in 1927 were given at a total of 2,713,700 acres. Of this figure, 2,564,700 acres were reserved forest, 114,000 unreserved, and 35,000 acres privately owned. These figures do not include, however, vast tracts of three savannas on public lands containing

much valuable but scattered timber. The chief agricultural products are cereals, manioc, peas and beans, groundnuts, oil products, sweet potatoes and other vegetables, fruits (chiefly bananas), and coffee. Sisal and cotton production are also important industries. The output of cotton in the 1926-27 season was estimated at 10,000,000 pounds. The principal minerals found are coal, gold, mica, graphite, iron and copper ores, cobalt, and nickel. The imports in 1926 were valued at £3,152,422; exports, £3,129,292; transit, £1,423,045. The principal imports consisted of cotton piece goods, foodstuffs, building materials, iron and steel manufactures, machinery, gasoline and kerosene, cigarettes, and liquors. The principal exports were sisal, cotton, groundnuts, coffee, hides and skins, copra, grain, simsim, beeswax, ghee, and chilies. The revenues in 1926 were £1,975,400 and the expenditures £2,233,625. In 1926, 380 steamers (exclusive of coastal boats) of 1,573,914 tons, and 4582 dhows of 100,333 tons, entered and cleared the various ports from places beyond the territory. There are about 1200 miles of railway in the country. In June the London *Times* reported that a new railway was about to be opened from Tabora, on the Central Tanganyika Railway, which connects the Indian Ocean with Lake Tanganyika, to Mwaza, at the south end of Lake Victoria. The line, which is 238 miles long, was 3 years under construction and cost over £800,000 to build.

The head of the administration is a governor, who is aided by a nominated executive council. Since Oct. 1, 1926, there has been a legislative council consisting of 13 official members and not more than 10 non-official members. Governor and Commander-in-Chief in 1928, Sir D. C. Cameron.

TARIFF AND AGRICULTURE. See AGRICULTURE.

TASMANIA. A state of the Australian Commonwealth, consisting of the island of that name and several small islands. Area, including the island of Macquarie (170 square miles), 26,215 square miles; population, according to the census of 1921, 213,780; estimated on June 30, 1927, 210,529. The movement of population in 1926 was: Births, 4988; deaths, 1912; marriages, 1435. Capital, Hobart, with a population including suburbs (Mar. 31, 1927), 52,100. The population of Launceston, including suburbs, on the same date was 27,000.

The agricultural produce in 1925-26 was: Wheat, 395,603 bushels; oats, 835,473 bushels; peas, 258,763 bushels; potatoes, 67,341 tons; hay, 114,920 tons; fruits, 4,664,109 bushels; and hops, 1,743,183 pounds. The value of agricultural and pastoral products was £4,274,000, mining products, £1,475,000, and of manufactures, £3,378,000. The chief minerals in order of value were copper, tin, lead, silver, zinc, coal, gold, and osmiridium. The two chief sources of exports are fruit preserving and metal extraction. The total imports in 1925-26 were valued at £8,450,793; exports, £8,710,855. The principal exports are wool, minerals, timber, fruit, grain, potatoes, hops, bark, and hides and skins. The total registered shipping amounted to 183 vessels of 13,776 tons. On June 30, 1926, Tasmania had 673 miles of railway that were opened to traffic.

The administration is under a governor, who acts through a responsible ministry, and the legislative power is vested in a parliament of

two houses, the Legislative Council of 18 members, elected on the basis of property qualification, and the House of Assembly of 30 members, elected for three years by universal suffrage, including women, and with proportional representation. Governor in 1928, Sir James O'Grady; Prime Minister, Treasurer, and Minister for Mines, J. A. Lyons.

TAXATION. The year 1928 was not a period of great change in taxation either from the Federal standpoint or from that of the individual State. Early in the year a revision of the Federal Income Tax Law was adopted, whose principal features included a readjustment of some of the income tax brackets relating to individual incomes, a minor change in the corporation tax, and some readjustments in internal revenue duty. These have been fully stated elsewhere in this volume under the head of PUBLIC FINANCE. Only nine States held regular sessions of their legislatures, these being New Jersey, New York, South Carolina, Rhode Island, and Massachusetts; those being in biennial session were four in number, Kentucky, Louisiana, Mississippi, and Virginia. Special sessions were held by Illinois, Nevada, Wisconsin, Kansas, and Iowa, while a special session began in California late in the year. Actual changes in State legislation were numerous, but they included no serious changes of principle, while no progress whatever was made toward the establishment of a closer relationship between State and Federal systems that had been under consideration.

Although the League of Nations continued its investigations into double taxation and suggested to various nations methods of cooperation with a view to reducing or eliminating the evil, no material progress in that direction has been accomplished.

STATE INCOME TAXES. In a few States some changes of interest affecting income taxation were made, among them the following: New York State provided that the exemption of \$3500 cannot be claimed for the whole year, if a taxpayer changes his or her marital status during the year. In the latter case, there must be a pro-rating of the tax according to the period of duration of the two conditions. An increase of the minimum income which must be reported has been provided in Wisconsin, the change being from \$700 to \$800 for single persons, and from \$1500 to \$1600 for married persons. Wisconsin also provided a new method for determining net incomes for 1928.

STATE INHERITANCE TAXES. Reciprocity was provided with reference to the taxation of the intangible personality of non-resident decedents by a law of Mar. 12, 1928, retroactive to July 1, 1925, and this provision was accepted by all the States which already had reciprocity of tax treatment with New York except Ohio, Pennsylvania, and Maryland. Reciprocity in taxes was also provided by Mississippi under a law of April 22, while deductions from gross estate were raised from \$25,000 to \$100,000 and adjustments have been made to the Federal Law. Reciprocity of inheritance tax relations has also been established with 14 States and with the District of Columbia by the Province of Ontario. New inheritance tax legislation under which the intangible personality of non-residents would not be taxed after Jan. 1, 1928, was adopted by Virginia. New York made the estate tax applicable to those of \$200,000 instead of only to those of \$1,000,000.

STATE CONSTITUTIONAL AMENDMENTS. State constitutional amendments were of little importance in the field of taxation during 1928, although a general amendment designed to change taxes of corporations was drafted and placed before the California legislature which up to the end of the year had not adopted it. However, considerable work was done by the courts in connection with the constitutionality of taxation. The Appellate Division of the New York Supreme Court held unconstitutional the license tax on foreign corporations issuing no-par stock and this left the tax in force as $\frac{1}{16}$ of 1 per cent of the actual capital employed within the State. Utah courts held unconstitutional the law requiring foreign corporations to pay an annual tax based on the entire capital stock of the corporation. According to the Attorney-General of the State, this decision applied both to domestic and foreign enterprises. The Montana tax on the privilege of grazing foreign livestock, the Illinois tax on gasoline, the intangible tax in California, and the mortgage registry tax in Kentucky were all likewise held unconstitutional. A few other controversies involving constitutional questions were before the courts in various States but no decisions of importance had been reached, and on some cases the issues were still hanging fire.

SPECIAL TAXES. The State tax sale was abolished in New York, where there are still five counties which had been in the habit of returning to Albany unpaid real property taxes for collection through sales. In New Jersey, fees payable for the redeeming of property under the tax-sale law, had been raised from \$10 to \$12. In Mississippi, cattle were exempted from State and county taxes for five years, and the same was true of hotels of 25 or more rooms built by a corporation before Jan. 21, 1932, which were exempt from county and municipal taxes. Gasoline taxes were revoked by New Jersey, in the case of rural mail carriers up to 1500 gallons. According to a decision of the Supreme Court of the United States, gasoline taxes could not be collected from the United States by a State government. Rhode Island gave veterans of the Philippine Insurrection and of the China Relief Expedition the same exemption privileges as the veterans of past wars. New Hampshire raised the gasoline tax from three cents to four cents a gallon, and Virginia from four and one-half to five cents a gallon, Massachusetts imposed a two-cent per gallon tax. In Illinois, the tax on gasoline was held unconstitutional, and the question of constitutionality of the gasoline tax was brought up in Kansas. The Massachusetts tax on gasoline was to become effective Jan. 1, 1929, to be paid by distributors and the proceeds used as a highway fund. Taxation of motor vehicles in Massachusetts was altered so as to provide for levy as an excise on registered motor vehicles instead of as a local general property tax. These proposed changes were held constitutional by the Massachusetts court. Registration fees were reduced by about 75 per cent. Bank taxation was under extensive discussion in California, but no positive action was taken. In many States the whole matter was held up awaiting action by Congress on Section 5219 Revised Statutes, which had not come to pass. Virginia reduced its bank-stock tax from \$1.10 to \$1.00 on \$100 of actual value. Minor changes were made in New York with regard to the income tax on banks

and trust companies. South Carolina changed its method of administering the admission, soft-drinks and license tax. All bottled soft drinks must bear either a stamp or certain stamp or crown manufactured for the State and furnished by it. The State also furnished admission tickets for places of amusement. South Carolina, moreover, introduced an additional license tax of \$100 per store on all chain stores.

DIRECT TAXES. The only change in the direct tax during the past year has been made in New York State where the rate has been cut from 1 mill to $\frac{1}{2}$ mill.

STATE TAX COMMISSIONS. In 1926 a commission was created in Virginia to make a study of, and to revise and codify, the general tax laws of the State. The report of the commission was filed and established the "tax code of Virginia" which cuts down the volume of tax statutes by about 50 per cent, repealing all obsolete tax laws. Local governments have real estate and tangible personality, while the State has intangible personality as a source of income. Massachusetts continued the special tax commission for another year, and New Jersey created one consisting of eight members for the study of the personal property tax. California also had a tax commission assisted by experts at work, but the close of the year did not find the investigation complete.

TAXES COLLECTED BY STATES

State	1927	1928
Alabama	\$ 10,517,548.70	\$ 8,175,313.47
Arizona	1,856,485.45	1,847,196.23

FEDERAL TAX RECEIPTS. Federal Tax receipts during the (fiscal) year 1928 are restated under the head of PUBLIC FINANCE, as a part of general treasury income. See PUBLIC FINANCE. The aggregate total showed decrease in (ordinary) receipts from \$4,023,000,000 in 1927 to \$3,863,000,000 in 1928. Internal revenue collections including income taxes, tobacco, and other miscellaneous excises decreased from \$2,869,000,000 to \$2,792,100,000 or \$75,000,000 below the preceding year, while receipts from customs and miscellaneous sources, including government-owned securities, Panama tolls, etc., were \$1,247,200,000 as compared with \$1,260,000,000 in 1927. Customs receipts fell off markedly, going from \$605,500,000 to \$568,156,000, owing to the larger importation of raw materials, either on a free basis or at low rates.

During the year the Executive Department raised a considerable number of tariff rates under the terms of the flexible tariff sections, but the aggregate was not sufficient to bring about any material alteration in total income that was more favorable to the Government. Corporation income taxes, which had been subject to some changes, tended to vary considerably, while income taxes remained nearly stable except for the increments growing out of the tremendously large profits in the stock market which had resulted in largely increasing the number of individuals paying taxes in the very highest groups. The following table shows the percentage distribution of revenue from income tax, as between corporations and individuals during the past two years as compared with five years earlier.

	Corporation per cent	Individual per cent
1922	47	53
1927	58	42
1928	59	41

While the increased proportion of income taxes returned by corporations reflected the effects of the income tax adjustment for 1926, when the rate was set at 13 per cent for 1925, and 13½ per cent for subsequent years, later figures introduced a new element. This was furnished by the increasing number of enterprises which reported no net revenue for taxation. The percentage of such reports in 1928 was 45 (that is to say, 45 per cent of the total number of corporation tax returns that were handed in). The tendency therefore was toward the increasing of incomes from large earnings made by the greater corporations, while income-tax receipts from the smaller corporations fell off on account of the growth in number which had no taxable income. The total number in the latter class was 10 per cent higher in 1928 than it was in 1922.

On the other hand, the concentration of the individual income tax continued, the returns for 1928 showing that very nearly 98 per cent of individual taxpayers were relieved from income-tax payments under the existing law, as the result of personal credit exemptions. The changes made in the income-tax law of 1928 did not of course show in the returns for that year. General prosperity, despite some falling off of business during the year 1927, accompanied by large stock-market profits must be regarded as the fundamental factors tending to keep up individual income-tax receipts notwithstanding the predictions of decline which had been made by various Treasury officials.

For the calendar year 1926, as reported by the Secretary of the Treasury at the end of 1928, 853,838 individuals with an income of \$5000 or more each, returned \$13,864,000,000, while of these 853,838 individuals, those with incomes from \$5000 to \$50,000 each, returned \$9,528,690,000. The largest number of corporations making tax returns prior to 1925 was 417,421. For 1925, the number reporting was 430,072; for 1926, 455,320; and for 1927, 452,853. In the latter year, corporations to the number of 249,847 returned net income amounting to 8,070,000,000 and paid an income tax amounting to \$1,291,845,989, while the number returning no net income was 203,006.

CHANGES RECOMMENDED TO CONGRESS. No changes of importance were before Congress at the end of 1928 save minor alterations designed to provide for corrections of practice here and there. The changes actually made in the Revenue Act of 1928 have been reviewed elsewhere under the head of **PUBLIC FINANCE**. It was, however, plainly indicated in Government statements, as well as by authoritative addresses, delivered during the campaign of 1928, that the limit of the income-tax reduction by the Federal Government had been approximately reached. Federal taxation and revenue had become finally balanced against expenditure. The prospect of an extended tariff revision indicated by the hearings before the Ways and Means Committee during the autumn and winter of 1928-1929 afforded the most positive assurance of income-tax changes, since general advance in tariff duties would, as matters stood, almost unavoidably involve a corresponding decline of incomes, and this in turn would lead to deficit conditions which could be most easily corrected by making changes either in the corporation or in the individual income taxes.

TAXATION, FARM. See **AGRICULTURE**.

TAXES. See **PUBLIC FINANCE**.

TAYLOR, WILLIAM SYLVESTER. American lawyer and officeholder, died at Indianapolis, Ind., August 2. He was born in Butler County, Kentucky, Oct. 10, 1853. He was the central figure in the case of the shooting of William Goebel, at Frankfort, Ky., Jan. 30, 1900, in the contest between the latter and Taylor for the Governorship of Kentucky, Goebel having been the Democratic candidate and Taylor the Republican. The Democratic vote had been divided in the preceding election and Taylor had been declared elected. A committee of the legislature was prepared to submit a report unseating him in favor of Goebel, on charges of fraud, when the latter was shot. Taylor was accused by his political opponents of planning the crime and was indicted, and to avoid a fate similar to that of Goebel, as was alleged, he fled to Indianapolis, Ind. He spent the rest of his life there, never returning to Kentucky so far as known. He was a self-educated man, and had been admitted to the bar. His gift as a speaker had won for him the offices of Clerk of Butler County, county judge, and Attorney-General of Kentucky, before his campaign for the governorship. After his removal to Indianapolis, he resumed the practice of law and engaged in the insurance business there.

TEACHERS' COLLEGES. See **UNIVERSITIES AND COLLEGES**.

TELEGRAPHY. The remarkable growth of the International Telephone and Telegraph Com-

pany and its absorption, first, of the All-America Cable Company and, second, of the Mackay Cable Company was one of the features of the year. Incidentally, the International Company acquired the control of the principal wire communication systems in Spain, Argentina, and other South American countries. The British were also proceeding in the merging of all their overseas communication systems. The Western Union Company laid a new high-speed cable from Newfoundland to the Azores, connecting there with other cables to Spain, Portugal, Italy, and Germany.

The Western Union made arrangements with the Bell Companies by which telegraph messages may be telephoned from any home or other private station and may be delivered at the other end by telephone, thus providing a house to house telegraph system over the whole country. Another arrangement between these two companies was one in which the telephone company rents to one or another of the telegraph companies its excess channels of communication obtained by duplexing or quadruplexing the physical circuits. This made it possible to send telephone and telegraph messages simultaneously over the same wire and greatly increases facilities without putting up additional wires. The telegraph companies also obtained the right to use the method of sending "facsimile" messages, that is, actual reproductions of letters, documents, photographs, etc.

As a result of the great increase in business on the New York Stock Exchange, the old "ticker" system of sending market quotations all over the country was swamped and was frequently an hour behind the actual sales. The Western Union is now installing a new fast ticker system, which is designed to meet the needs of our much increased financial business.

A new feature of the cable business was the arrangement by which "night cable letters" may be sent at reduced rates, making it possible to send a 50-word letter to Europe at a cost as low as two dollars.

TELEPHONY. Telephone traffic in the United States continued to increase during 1928 and averaged 76,000,000 completed conversations daily, of which more than 3,000,000 a day were toll conversations. At the end of the year the telephone companies in the United States employed more than 390,000 people. There were also more than 50,000 employees in the Western Electric Company (manufacturers of telephone plant and equipment), and in excess of 4000 employees in the Bell Telephone Laboratories where research and experimentation was carried on.

INCREASED LONG-DISTANCE FACILITIES. The construction of land telephone cables in the United States continued during 1928, and it was possible to talk through substantially storm-proof long-distance telephone cable from Maine to North Carolina and as far west as Iowa and Missouri. During the year the projected New York-Atlanta telephone cable was pushed southward from Petersburg, Va., to Greensboro, N. C. New telephone cable was also constructed southward from Toledo to Findlay, Ohio, and additional cables were placed on other existing cable routes. The total land telephone cable construction by the Bell System during 1928 amounted to about 1500 miles of cable. Additional telephone circuits were added during 1928 on the three

transcontinental telephone routes, additional wires being strung from Omaha via Denver and Salt Lake City to Sacramento; along the northern transcontinental route, the Western terminal of which is at Seattle; and also from El Paso, Tex., to Los Angeles along the Southern transcontinental telephone line. The Long Lines Department of the American Telephone and Telegraph Company expended a total of \$47,650,000 for new construction of cable and other long-distance telephone facilities during 1928.

At the end of the year, the Bell System had over 200,000 miles of carrier channel in operation on long-haul routes. A system of carrier telephony was introduced during 1928 which is applicable to shorter lines.

The use of long-distance telephone circuits for connecting chains of radio broadcasting stations, sending out a single programme simultaneously, made further progress during 1928. On one occasion, 106 broadcasting stations were thus linked up by 25,300 miles of telephone wire.

THE TRANSATLANTIC SERVICE. The number of points which could be reached by telephone from the United States was substantially increased in 1923 by successive extensions of the transatlantic telephone service. At the end of the year it was possible to talk from practically any point in the United States, Cuba, Ontario, and Quebec and from certain cities in other parts of Canada and in Mexico to virtually any place in England, Scotland, and Wales, Germany, Switzerland, Belgium, Spain, France, and The Netherlands, as well as to Copenhagen, Stockholm, Gothenburg, Malmö, Oslo, Vienna, Budapest, Prague, and Danzig. One point in Africa—Ceuta, Spanish Morocco—was also made accessible by transatlantic telephone. At the formal opening of telephone service between the United States and Madrid, President Coolidge conversed from Washington with King Alfonso of Spain, at Madrid. Interconnection was possible throughout a network of 27,000,000 telephones serving a population of nearly 330,000,000. The hours of service on the transatlantic circuit were also extended during 1928 and the rates were reduced. On June 1, a short-wave radio telephone circuit was placed in service to supplement the previously existing long-wave facilities and the construction of additional short-wave circuits was undertaken. On February 16, two audiences, one in New York and the other in London, conducted a joint meeting by transatlantic telephone.

Announcement was made during 1928 that the Bell Telephone Laboratories had developed a long-distance deep-sea telephone cable capable of successfully transmitting speech across the Atlantic Ocean.

CONTRACTS WITH TELEGRAPH COMPANIES. Simultaneous transmission of telephone and telegraph messages over the same wires was one of the improvements that would be effected on a nation-wide scale as a result of far-reaching arrangements consummated between the American Telephone and Telegraph Company and two telegraph companies, the Western Union Telegraph Company and the Postal Telegraph and Cable Corporation. A series of non-exclusive contracts entered into with each of the telegraph companies makes provision for furthering the development of electrical communications along lines made possible by the latest devices and methods developed through the work of the Bell system research experts. By these arrangements the users

of electrical communications will receive the benefit of many of the advantages that would follow the consolidation of all electrical communication facilities, but at the same time the telephone and telegraph companies will maintain complete independence of each other. One of the new contracts makes the long distance telephone lines of the American Telephone and Telegraph Company available for the transmission of telegraph messages handled by these two telegraph companies.

Further utilization of telegraph lines will be made possible under another of the contracts which provides that the Western Union Telegraph Company and the Postal Telegraph and Cable Corporation may lease apparatus developed in the Bell Telephone Laboratories, the research organization maintained by the American Telephone and Telegraph Company, by which a single pair of telegraph wires may be made, under certain conditions, to serve as several telegraph channels.

Still another of this series of contracts makes available for the customers of these two telegraph companies the use of the telephone company's telephone system for the transmission of facsimile messages between cities in which stations for the transmission of pictures by wire are maintained by the telephone company. In 1928 telephotograph service was available between New York, Boston, Atlanta, Cleveland, Chicago, St. Louis, San Francisco, and Los Angeles.

RESEARCH. Experiments were carried forward during 1928 by the Bell Telephone Laboratories for the development of radio telephone communication in connection with aviation, and telephone research was also actively prosecuted along many other lines. There has recently been developed in the Bell Telephone Laboratories a new group of magnetic alloys known as "perminvars." These are a series of alloys of nickel, iron, and cobalt which have unusual magnetic properties, making them particularly suitable for various uses in electrical communication, including continuous loading of telephone conductors.

A notable advance was made to wire communication in standardization and utilization of an 1800-pair telephone cable. Heretofore, 1200-pair cables had been in service, but with an increase of 50 per cent in circuit capacity, the new cables would provide many more voice channels in the congested, underground conduit systems of large cities. The vacuum-tube telephone repeater finds a particular application in long-distance telephone cables. Marked developments in these vacuum-tube repeaters came in the lengthening of the service life by several fold and a substantial decrease in consumption of electric power for their operation.

FINANCING. During 1928 the largest piece of telephone financing ever undertaken was successfully carried out through the offer of \$185,863,000 par value of American Telephone and Telegraph Company stock to the stockholders. More than 430,000 stockholders received rights to subscribe and 265,000 subscriptions were sent in covering more than 99½ per cent of the stock.

TELEVISION. See RADIO TELEGRAPHY AND BROADCASTING.

TEMPLE UNIVERSITY. An institution for the higher education of men and women at Philadelphia, Pa., founded in 1884. The 1928 autumn

enrollment was 9958, distributed as follows: Liberal arts and sciences, 1111; teachers' college, 3351; elementary school, 97; commerce, 2740; theology, 60; law, 761; medicine, 223; pharmacy, 348; dentistry, 436; music, 225; chiropody, 51; university high school, 423; training school for nurses, 105; oral hygiene, 27. The summer school registration was 1352. There were 587 members on the faculty. The income for the year totaled \$1,366,690. The library contained 41,606 volumes. President, Charles E. Beury, LL.D.

TENNESSEE. POPULATION. According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 2,337,885. The estimated population on July 1, 1928, was 2,502,000. The capital is Nashville.

AGRICULTURE. The following table gives the acreage, production, and value of the principal crops in 1927 and 1928:

Crop	Year	Acreage	Prod. bu.	Value
Corn	1928	2,915,000	56,842,000	\$56,842,000
	1927	2,944,000	70,656,000	58,644,000
Cotton	1928	1,086,000	420,000 ^a	37,880,000
	1927	965,000	359,000 ^a	34,105,000
Hay	1928	1,360,000	1,840,000 ^b	30,808,000
	1927	1,402,000	1,822,000 ^b	27,114,000
Tobacco	1928	112,400	88,459,000 ^c	19,462,000
	1927	87,800	68,484,000 ^c	14,661,000
Wheat	1928	422,000	3,714,000	5,311,000
	1927	528,000	3,696,000	5,137,000
Potatoes	1928	43,000	4,085,000	3,676,000
	1927	39,000	3,432,000	4,633,000
Sweet potatoes	1928	41,000	3,895,000	3,700,000
	1927	48,000	4,704,000	3,998,000
Oats	1928	188,000	4,042,000	2,425,000
	1927	179,000	3,043,000	1,826,000

^a bales, ^b tons, ^c pounds.

MINERAL PRODUCTION. The highly varied mineral industries of the State are dominated in point of importance by coal mining, which annually furnishes an output of about one-fourth of the entire mineral total of the State. In 1927 coal mining held its own in Tennessee, although labor conditions in this industry were disturbed in other States. There were mined 5,783,367 net tons of coal, as against 5,788,741 in 1926; the value of coal mined was: 1927, \$10,645,000; 1926, \$10,975,000. Cement shipments, next in importance, attained the quantity of 5,053,528 barrels for 1926 and declined to 4,343,337 for 1927; their value was: 1927, \$6,580,732; 1926, \$8,352,095. The clay products of 1926 had a value of \$5,105,827; those of 1925, \$3,941,395. Coke continued to be made in beehive ovens in the State, these producing 122,410 short tons valued at \$506,017 in 1926, but the use of by-product ovens was somewhat on the increase. These produced 122,000 short tons of coke in 1927, as against 118,624 in 1926 valued at \$628,492.

The copper industry of the State was less active in 1927, there being a smelter output of 14,498,951 pounds, as compared with 18,601,586 in 1926. The mine production of copper in 1926, slightly in excess of the smelter output, was valued at \$2,604,933. Pig iron was produced to the quantity of 87,971 long tons in 1927 and 113,029 in 1926; in value, \$1,911,380 for 1927 and \$2,544,825 for 1926. The iron-ore output remained below \$400,000. Phosphate rock production was 455,395 long tons in 1926, 464,240 in 1925; in value, \$1,980,613, for 1926 and \$2,334,995 for 1925. The output of lime was large, the producers' sales being 176,000 short tons (estimated) for 1927 and 173,363 for 1926; in value, \$1,261,000

for 1927 and \$1,319,303 for 1926. The stone output of 1926 was valued at \$4,170,016. After copper, the chief metal in point of total production value was zinc. There were mined in 1926, 12,008 short tons of zinc; in 1925, 16,256. The value of zinc produced was \$1,814,700 for 1926 and \$2,470,912 for 1925. Lead, gold, and silver were obtained in minor amounts. The total value of the State's mineral products was, for 1926, \$39,296,668; for 1925, \$38,869,198.

FINANCE. State expenditures in the year ended June 30, 1927, as reported by the U. S. Department of Commerce, were: for maintenance and operations of State governmental departments, \$16,075,340 (of which \$3,883,158 was aid to local education); for interest on debt, \$901,873; for permanent improvements, \$10,963,010; total, \$27,940,223 (of which \$14,136,780 was for highways, \$4,532,159 being for maintenance and \$9,604,621 for construction). Revenue was \$26,534,880. Of this, property and special taxes formed 23.7 per cent; departmental earnings and charges for officials' services, 8.0 per cent; sales of licenses and taxation of gasoline, 43.5 per cent. Property valuation was \$1,720,780,504; State taxation thereon, \$3,441,561. Net State funded debt on June 30, 1927, was \$17,222,176.

TRANSPORTATION. The total number of miles of railroad line under operation on Jan. 1, 1928, was 4062.69. There were built in 1928, 1.85 miles of additional second track.

EDUCATION. Among the developments of 1928 in the State educational system, as reported by Commissioner P. L. Harned in the *Journal* of the National Education Association, was the arrangement by which an appropriation of \$1,000,000 by the State, for replacing and repairing country schoolhouses, was to be augmented by one-half through appropriations of the counties, each in accordance with the share of the State total apportioned to it. A normal school of junior college grade was established at Clarksville for the training of country teachers. New buildings were added to the Polytechnic Institute, the Agricultural and Industrial College for Negroes, and three teacher colleges. For the school year 1926-27 the population of school age (6 to 18 years) was given by the State Department of Education as: white, 494,513; colored, 106,894; total, 601,407. There were enrolled in the public schools, according to the same source, a higher total, namely, 649,007, including 117,392 Negroes. The daily attendance, however, was lower, being: white, 371,362; colored, 85,515; total, 456,877. Of the attendance 286,401 was in county elementary schools, 37,029 in county high schools, 121,114, in city elementary schools and 12,333 in city high schools. Teachers' salaries averaged \$799.47 a year, the county elementary teachers' average being \$584.98 and all other teachers' about \$1160. Total expenditure for county schools was \$17,635,069; for city schools, \$11,161,099.

CHARITIES AND CORRECTIONS. Supervision of the institutions of the State is in the hands of a State Department of Institutions under a single commissioner. The institutions include most of the chief types common in the States, but have lacked an institution for the criminal insane, for which Commissioner Pope has sought appropriations. A Welfare Division, created under an act of 1925, has conducted a State-wide inspection of county and local institutions and welfare agencies. The State institutions are: Eastern, Central, and Western State Hospitals (men-

tal); Home for Feeble-Minded Persons; Tennessee School for the Deaf; Tennessee School for the Blind; Tennessee Industrial School; State Training and Agricultural School for Boys; Tennessee Vocational School for Girls; Tennessee Vocational School for Colored Girls; Confederate Soldiers' Home; Brushy Mountain Penitentiary; State Penitentiary.

POLITICAL AND OTHER EVENTS. The joint effort of North Carolina and Tennessee to provide the money for the purchase of lands in the Great Smoky Range to form a National Park was advanced by a gift, announced in March, of \$5,000,000 by the Laura Spelman Rockefeller Memorial to the park fund. There had been raised up to that time or promised, partly by legislative appropriation in the two States and partly by private subscription, nearly \$5,000,000, and consequently the intended total of \$10,000,000 was brought within view by the above-mentioned \$5,000,000 gift.

In the State primary elections of July 31, Governor Horton gained the Democratic nomination for reelection, defeating Hill McAlister by a somewhat narrow margin. Senator Kenneth D. McKellar received the Democratic nomination for Senator to succeed himself.

ELECTION. At the election of November 6, a considerable part of the Democrats cut Alfred E. Smith, the Democratic presidential candidate, thus giving the State to Herbert Hoover, Republican, by a moderate plurality. The presidential vote was: Hoover, 195,388; Smith, 157,343. Other Democrats were generally elected. Kenneth McKellar, Democrat, was reelected to the United States Senate, and the delegation of United States Representatives remained at eight Democrats and two Republicans, all reelected men but one. Governor Henry H. Horton, Democrat, was likewise elected for another term.

OFFICERS. Governor, Henry H. Horton; Treasurer, John F. Nolen; Comptroller, Edgar J. Graham; Secretary of State, Ernest Haston; Auditor, O. S. Shannon; Attorney-General, L. D. Smith; Commissioner of Education, P. L. Harner.

JUDICIARY. Supreme Court: Grafton Green, Chief Justice; Associate Justices, A. W. Chambliss, Colin P. McKinney, W. H. Swiggert, William L. Cook.

TENNESSEE, UNIVERSITY OF. A non-sectarian, coeducational institution of higher education at Knoxville, Tenn., with colleges of medicine and dentistry and a school of pharmacy at Memphis, and a junior college at Martin; founded in 1794. The total enrollment of 4594 students in 1928 was distributed as follows: Summer session, Knoxville, 1423; summer session, Martin, 107; autumn quarter, Knoxville departments, 224; Memphis departments, 710; and junior college, Martin, 130. There were 308 members on the faculty. The land grant amounted to \$400,000 and the income for the year 1927-28 was over \$2,240,000. The library contained 96,173 volumes. President, Harcourt A. Morgan, LL.D.

TENNIS. France, for the second year in succession, ranked first among the nations on the lawn-tennis court. The French players, René Lacoste, Henri Cochet, and Jean Borotra, successfully defended the Davis Cup, emblematic of the world's championship, which they had won in 1927 by defeating the United States team of William T. Tilden, 2d, John Hennessey, and Francis Hunter in the challenge round by four

matches to one. The lone victory gained by the United States went to the credit of Tilden, who had been removed from the Davis Cup team, of which he was captain, just previous to the challenge matches by the U. S. Lawn Tennis Association officials on the ground of having violated the player-writer rule. This action barred Tilden from competing in the intra-zone final between the United States and Italy, which, however, the United States won without him. So intense was the feeling aroused by the banning of Tilden that Myron T. Herrick, United States Ambassador to France, finally intervened and secured Tilden's reinstatement in time for the challenge round. After the Davis Cup competitions, however, Tilden was suspended by the U. S. L. T. A. and his case was to come up before the executive committee of the Association in February, 1929, for final action.

The pre-challenge round of the Davis Cup play, which resulted in narrowing down the challenging field to the United States and Italy were as follows:

European Zone: First Round—Italy defeated Australia, 4 matches to 1; Rumania defeated Belgium, 5 to 0; Germany defeated Greece, 4 to 1; Spain defeated Chile, 3 to 2; Finland defeated Jugo-Slavia, 4 to 1; England defeated Argentina, 4 to 1; Hungary defeated Norway, 5 to 0; Holland defeated Ireland, 5 to 0; Denmark defeated Poland, 5 to 0; Austria defeated the Philippines, 4 to 1.

Second round—India defeated Switzerland, 3 to 2; Italy defeated Rumania, 4 to 1; Germany defeated Spain, 3 to 2; England defeated Finland, 5 to 0; Holland defeated Hungary, 3 to 2; Austria defeated Denmark, 4 to 1; Czechoslovakia defeated Sweden, 4 to 1; New Zealand defeated Portugal, 4 to 1.

Third Round—Italy defeated India, 4 to 1; England defeated Germany, 4 to 1; Holland defeated Austria, 5 to 1; Czechoslovakia defeated New Zealand by default.

Final Round—Italy defeated England, 4 to 1; Czechoslovakia defeated Holland, 3 to 2.

Interzone Final—Italy defeated Czechoslovakia, 3 to 2.

American Zone: First Round—Japan defeated Cuba, 5 to 0; United States defeated Mexico, 5 to 0.

Semi-final Round—Japan defeated Canada, 3 to 1; United States defeated China, 5 to 0.

Final Round—United States defeated Japan, 5 to 0.

Nearly ten thousand spectators were on hand for the challenge round matches between the United States and France which was contested at Auteuil, near Paris, from July 27 to July 30, inclusive. The results of the matches follow:

Singles—Tilden defeated Lacoste, 1-6, 6-4, 6-4, 2-6, 6-3; Cochet defeated Hennessey, 5-7, 9-7, 6-3, 6-0; Cochet defeated Tilden, 9-7, 8-6, 6-4; Lacoste defeated Hennessey, 4-6, 6-1, 7-5, 6-3.

Doubles—Cochet and Borotra defeated Tilden and Hunter, 6-4, 6-8, 7-5, 4-6, 6-2.

The Wightman Cup international team match held at Wimbledon saw the triumph of the English women's team of Miss Eileen Bennett, Mrs. M. Holcroft Watson, Miss Betty Nuthall, Miss L. Harvey, and Miss Peggy Saunders over a United States team comprising Miss Helen Wills, Mrs. Molla Mallory, Miss Helen Jacobs, Miss Eleanor Goss, and Miss Anderson. The English side won by three matches to two, Miss Wills scoring two victories for the United States and Miss Jacobs the other.

Henri Cochet, the sensational French player, captured the United States national singles title by defeating Francis T. Hunter in the final, 4-6, 6-4, 3-6, 7-5, 6-3. René Lacoste, who won the title for France in 1927, did not defend his crown and William T. Tilden, 2d, the leading United States player, watched the play from the press box.

The holders of the various United States championship titles at the close of 1928 were: Singles,

Henri Cochet; doubles, George Lott and John Hennessey; Women's singles, Miss Helen Wills; women's doubles, Miss Wills and Mrs. George Wightman; clay-court singles (not held); indoor singles, William Aydelotte, indoor doubles, Aydelotte and Perrine Rockafellow; intercollegiate singles, Julius Seligson; intercollegiate doubles, Ralph McElvenny and Alan Herrington.

The Wimbledon men's singles were won by René Lacoste and the doubles by Henri Cochet and Jacques Brugnon. Miss Helen Wills, for the second consecutive year, captured the women's singles, the doubles going to Mrs. Holcroft Watson and Miss Peggy Saunders.

TENNYSON, HALLAM, LORD. English author, second son of Alfred, Lord Tennyson, died on the Isle of Wight, December 2. Born at Twickenham, Aug. 11, 1852, he attended Marlborough College, and Trinity College, Cambridge, later studying law at Inner Temple. He then became private secretary for his father, also doing literary work. The best known of his books is *Jack and the Beanstalk*, illustrated by R. Caldecott, and he also contributed to magazines, publishing a translation of *Brunanburh* in the *Contemporary Review*, November, 1876, which his father afterward put into verse. Lord Tennyson wrote *Alfred, Lord Tennyson: A Memoir* (1897), and edited: Charles Tennyson Turner's collected lyrics and sonnets, *Poems by Two Brothers*, *In Memoriam*, the Eversley edition of his father's complete works, with notes by the poet (1908); and *Tennyson and His Friends* (1912). Lord Tennyson served as governor and commander-in-chief of South Australia, 1899-1902, first acting governor-general of the Commonwealth of Australia in 1902, and governor-general of Australia, 1902-04. He was honorary colonel of the South Australian Artillery, and of the Seventh Victorian Light Horse. Being made deputy-governor of the Isle of Wight in 1913, he held that office until his death. Cambridge, and the universities at Melbourne and Adelaide, Australia, conferred on Lord Tennyson the Litt.D. degree, and he received the D.C.L. degree from Oxford. He was created a Knight Commander of St. Michael and St. George in 1899, a Knight of the Grand Cross of St. Michael and St. George, 1903, a privy councillor, 1905, and awarded the Grand Cross of the Japanese Order of the Rising Sun, 1905.

TEREDO. See ZOÖLOGY, under *Mollusca*.

TERRY, DAME ELLEN (ALICE). English actress, died at Small Hythe, near Tenterden, Kent, England, July 21. She was born at Coventry, England, Feb. 27, 1848. She came of a theatrical family, being the daughter and granddaughter of players. Her parents, Benjamin and Sarah Terry, were among the best and best-known provincial actors of England of their time. Her three sisters and three brothers all attained prominence on the boards, as did her two children (Edith and Edward, known as Ailsa and Gordon Craig) and three nieces. Ellen Terry (who dropped the name "Alice" early in life) made her first appearance on the stage at the age of eight, as the boy Mamillius in Charles Kean's revival of *A Winter's Tale*, at the Princess's Theatre in London, in 1856. In the audience were Queen Victoria, the Prince Consort, and a great concourse of the officials and aristocracy of England. Later, Ellen Terry was honored by royalty as the greatest living English-speaking actress. In March, 1863, she made her appearance at the

Haymarket Theatre, London, having played in the meantime a variety of rôles, including Puck in *A Midsummer Night's Dream*. She also took the part of Desdemona in *Othello*. Then came her temporary retirement from the stage in 1864, following her marriage to the painter, G. F. Watts, much her senior in years. The marriage was unhappy and was dissolved, and in two years she was back on the stage. She was later married to Charles Wardell, whose stage name was Kelly, and who died in 1885, and in 1907 to James Carew, also an actor, and the leading man in her company. For six years before 1875 she lived in retirement, and then joined the Bancrofts at the Prince of Wales's Theatre, where she acted the part of Portia. It was in this period that her charm of personality, manner, and voice won widespread recognition. In 1876 she played at the Court with John Hare, in Lord Lytton's *The House of Darnley*, and early in 1878 she won a great success in Wills's *Olivia*, at the same house. At the end of 1878 Miss Terry began her brilliant association of twenty-four years with Henry (later Sir Henry) Irving at the Lyceum, as Ophelia to his Hamlet. She had met Irving ten years earlier, and he had promised her a place as his leading lady when he should have his own theatre and company. She had played with him in *The Taming of the Shrew*. Her most notable rôles during her appearances with Irving were: Portia in *The Merchant of Venice* (1879), probably the most famous of all; Camma in Tennyson's *The Cup* (1881); Juliet in *Romeo and Juliet* (1882); Viola in *Twelfth Night* (1884); Marguerite in *Faust* (1885); Fair Rosamond in Tennyson's *Becket* (1893); Madame Sans Gène in a Sardou adaptation (1897); and Clarissa in *Robespierre* (1899). Miss Terry's leading place among English actresses was undisputed. Her later rôles included: Mistress Page in *The Merry Wives of Windsor* (1902); Alice Grey in Barrie's *Alice-Sit-by-the-Fire* (1905); Lady Cecily Waynflete in Shaw's *Captain Brassbound's Conversion* (1906); Hermione in *A Winter's Tale* (in which she had made her first stage appearance). At various times Miss Terry lectured on Shakespeare's heroines, with impersonations. In 1915, for this purpose, she visited the United States; her first visit to America as an actress was made in 1883, when she received a welcome that was repeated on eight subsequent occasions.

A jubilee performance was held in Ellen Terry's honor at Drury Lane, London, in June, 1906, to celebrate the fiftieth anniversary of her stage début. On this occasion Duse, Réjane, the two Coquelins, and other famous players from the Continent assembled in her honor, and Melba and Caruso sang. In 1916 she made her only appearance in the films, in a picture called *Her Greatest Performance*. Her last regular stage appearance was made in June, 1919, when she played the nurse in *Romeo and Juliet* to the Juliet of Miss Doris Keane, at the Lyric Theatre in London. The last years of her life were passed in retirement on her small estate in Kent, England. Her eightieth birthday, Feb. 27, 1928, was made the occasion of a demonstration of the affection in which she was held by the people of the English-speaking nations.

In 1925 King George of England conferred on Ellen Terry the high distinction of Dame Grand Cross of the Most Excellent Order of the British Empire. The University of St. Au-

draws, Scotland, had bestowed upon her in 1922 the honorary degree of Doctor of Laws.

In 1908 Miss Terry published *Story of My Life*, a volume of memories, and in 1913 *The Russian Ballet*. Many books were published about her and her art. Among them may be mentioned William Winter, *Shadows of the Stage* (1892); Hiatt, *Ellen Terry and Her Impersonations* (1898); Clement Scott, *The Drama of Yesterday and To-day* (1899); *Ellen Terry* (1900); T. E. Pemberton, *Ellen Terry and Her Sisters* (1902). See the article, HENRY IRVING, in THE NEW INTERNATIONAL ENCYCLOPEDIA.

TETANUS. Among the tragedies of medical practice are those cases of lockjaw which develop in clean wounds where all aseptic precautions have been taken, especially when the wounds are slight, trivial, and quick to heal, and where there is absolutely no warrant for giving prophylactic injections of anti-tetanus serum. Cases of this type are by no means rare and at times there is a doubt as to whether they are really due to the tetanus bacillus. In a case where fatal tetanus followed an injection of quinine in a fresh case of malarial fever, the author, Dr. J. E. Bordoy, a military surgeon of Madrid (*Archivos de medicina, cirugía y especialidades*, Nov. 28, 1928), felt obliged to eliminate all possibility of hysteria or simulation, strychnia poisoning, hydrophobia, meningitis, tetany, deep abscess of the throat, vertebral rheumatism, etc.—any of which conditions might (in theory at least)—produce lockjaw—before establishing his diagnosis of tetanus. The fact that an abscess developed eventually in the muscles of the buttocks where the injection had been made robbed this case of some of its mystery, for evidently there had been in some manner contamination from without; especially as the pus later showed signs of decomposition. But cases identical with the preceding have been wholly unaccompanied by any wound infection, giving rise to the belief that the malaria or the quinine had mobilized tetanus organisms already latent in the body and made it possible for these organisms to attack the nervous centres.

TEXAS. POPULATION. According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 4,663,228. The estimated population on July 1, 1928, was 5,487,000. The capital is Austin.

AGRICULTURE. The following table gives the acreage, production, and value of the principal crops in 1927 and 1928:

Crop	Year	Acreage	Prod. bu.	Value
Cotton	1928	17,766,000	5,150,000 ^a	\$450,625,000
	1927	16,176,000	4,352,000 ^a	419,968,000
Corn	1928	4,722,000	99,162,000	77,346,000
	1927	5,198,000	119,347,000	77,576,000
Wheat	1928	2,016,000	22,176,000	24,394,000
	1927	1,850,000	17,945,000	21,713,000
Grain sorghum	1928	2,760,000	69,000,000	41,400,000
	1927	2,654,000	55,734,000	36,227,000
Oats	1928	1,402,000	35,751,000	18,233,000
	1927	2,003,000	42,063,000	19,770,000
Hay	1928	856,000	941,000 ^b	11,881,000
	1927	848,000	968,000 ^b	10,853,000
Potatoes	1928	39,000	2,691,000	2,691,000
	1927	35,000	2,310,000	3,812,000
Sweet potatoes	1928	109,000	8,284,000	8,284,000
	1927	133,000	11,970,000	8,978,000
Rice	1928	174,000	7,308,000	6,431,000
	1927	174,000	8,039,000	6,914,000
Barley	1928	156,000	3,276,000	2,391,000
	1927	195,000	3,120,000	2,184,000

^a bales, ^b tons.

MINERAL PRODUCTION. About three-fourths of the total yearly value of mineral products of the State came in 1926 from petroleum. The output of petroleum increased considerably in 1927 but declined so greatly in price that the aggregate value of the 1927 product fell considerably short of that of 1926. The quantity produced in 1927 was 213,768,000 barrels; in 1926, 166,916,000. The value of the year's product was: 1927, \$249,600,000 (estimated); 1926, \$308,800,000. Natural gas output was 175,392,000 M cubic feet in 1927, the latest recorded year, as against 134,872,000 M in 1925; its value rose to \$28,165,000 for 1926, from \$19,715,000 for 1925. From natural gas were extracted in 1927, 316,600,000 gallons of gasoline, as against 243,093,000 in 1926; the value of this product was \$13,110,000 for 1927 (estimated) and \$22,760,000 for 1926. Cement production was 5,655,835 barrels in 1927 and 5,007,374 in 1926; cement shipments attained a value of \$10,232,908 for 1927 and \$9,522,701 for 1926. The coal production of the State was, in quantity, 1,326,385 net tons for 1927 and 1,091,158 for 1926; in value, \$1,998,000 for 1927 and \$1,751,000 for 1926. Gypsum production was 533,156 short tons in 1926 and 558,132 in 1925; in value, \$4,126,400 for 1926 and for 1925, \$3,721,954. Clay products totaled \$6,010,981 for 1926 and \$6,298,045 for 1925. The total value of the State's mineral products was, for 1926, \$420,586,730; for 1925, \$351,211,629.

In 1928, for the first time, Texas led all States in the production of crude petroleum with 256,888,000 barrels. The 1928 production of metals was: gold, \$12,000; silver, 1,391,000 ounces; lead, 877,000 pounds; copper, 316,000 pounds.

FINANCE. State expenditures in the year ended Aug. 31, 1927, as reported by the U. S. Department of Commerce, were: for maintenance and operation of governmental departments, \$56,648,830 (of which \$22,465,370 was aid to local education); for interest on debt, \$202,425; for permanent improvements, \$13,923,107; total, \$70,774,362 (of which \$19,764,148 was for highways, \$8,255,390 being for maintenance and \$11,508,758 for construction). Revenues were \$78,687,485. Of this, property and special taxes formed 33.6 per cent; departmental earnings and charges for officials' services, 5 per cent; sales of licenses and taxation of gasoline, 41.2 per cent. Property valuation was \$3,905,050,651; State taxation thereon, \$26,163,839. Net funded State debt on Aug. 31, 1927, was \$4,364,488.

EDUCATION. Two amendments to the State constitution, bearing on the public-school system, were adopted at the election of November, 1928. One of these empowered the State legislature to create a State board of education to replace the existing board, an ex-officio body consisting of the Governor, the Secretary of State, and the Comptroller. It was designed to bring into existence a less perfunctory type of central educational agency, which should have a more specialized grasp of its problem and at the same time should be more directly responsive to public opinion. To this end, the Legislature was invested with authority to settle the number of members, the length of term, the qualifications, and the duties of a statutory board. The other amendment, as set forth by State Superintendent S. M. N. Marrs in the *Journal of the National Education Association*, extended the limit of school trustees' terms to six years, from two. For the academic year 1927-28, the school popu-

lation of the State was given as 1,370,082. There were enrolled in the public schools of the State 1,232,696 pupils; of these, 1,016,464 were in the elementary grades and 216,232 were in high schools. For the year 1928 the expenditures for public-school education were approximately \$56,000,000. Salaries of teachers in the State averaged \$1140.

TRANSPORTATION. The total number of miles of railroad line under operation on Jan. 1, 1928, was 16,429.43. There were built in 1928, 353.3 miles of first, and 30.76 of second, track.

CHARITIES AND CORRECTIONS. The State Board of Control, operating under a statute of 1925, conducted, in 1928, 17 institutions of eleemosynary or reformatory character. Their average population for the year ending Aug. 31, 1928, was 12,987, not counting those on the rolls but absent. In connection with these institutions the board conducted a system of dairies and small hog herds to furnish part of the inmates' nourishment. The institutions were: Confederate Men's Home, Austin, population, 328; Confederate Women's Home, Austin, 100; School for the Blind, Austin, 225; School for the Deaf, Austin, 491; Deaf, Dumb, and Blind Institute, Austin, 208; State Orphans' Home, Corsicana, 565; Home for Dependent and Neglected Children, Waco, 147; Girls' Training School, Gainesville, 178; Juvenile Training School, Gatesville, 912; Austin State School, 610; Rusk State Hospital, Rusk, 1050; Terrell State Hospital, Terrell, 1842; San Antonio State Hospital, 2154; Austin State Hospital, 1986; Wichita Falls State Hospital, 978; Abilene State Hospital, 761; State Tuberculosis Sanatorium, at Sanatorium, 452.

The Texas State Prison had a total of 2325 prisoners received from the courts in 1927, or 43.1 per 100,000 of general population. There were 3864 prisoners confined on Jan. 1, 1928.

POLITICAL AND OTHER EVENTS. Water development assumed a phase of some importance during the year. The State Act of 1925 authorizing the creation of districts for the control, preservation, the distribution of water was declared invalid in March by the Third Court of Civil Appeals, on constitutional grounds, as failing to provide due process of law for affected landholders. The decision, on which appeal was taken to the State Supreme Court, rendered doubtful the validity of bond issues to an aggregate of some millions of dollars, put out by eighteen or more water districts. It was nevertheless reported by the State board of water engineers in July that irrigation projects for the reclamation of about 720,000 acres of land in the valleys of the Nueces, the lower Rio Grande, the Frio, the San Antonio, and other rivers had been authorized within a few months preceding.

The issue of the status of the colored voter in the Democratic party of the State was again brought up by means of an injunction suit brought by a Waco Negro lawyer, R. D. Evans, to prevent the Harris County Democratic Executive Committee from shutting colored persons out from the primary election of July 28. Federal Judge Hutcheson at Houston ruled against the Negroes seeking the injunction, and appeal was taken to the Federal Circuit Court. A ruling of the United States Supreme Court, in a previous action, in favor of an El Paso Negro excluded from the Democratic primary of 1924, had been followed in 1927 by an act of the Legislature placing party membership and voting qualifica-

tions specifically in the determination of the State executive committee of any political party.

Possession of title to mineral rights in some 2,000,000 acres of former State University and school lands was assured June 25 by decisions of the State Supreme Court in suits brought by mineral interests seeking the right to prospect on such lands. The Court held that the act relinquishing to acquirers of school lands fifteen-sixteenths of the minerals found thereon was valid; the Court also affirmed the right of county commissioners to lease county school lands for prospecting. The lands involved in the proceedings were considered to include petroleum prospects of great potential value.

Construction was begun on the section of Intracoastal Canal between Galveston and Port Arthur early in the summer. This section, 68 miles in length, was expected to require \$2,500,000 of the expected construction cost of \$16,000,000 for the entire canal from Corpus Christi to the Mississippi River. A Federal survey to determine the possibility of deepening the channel of the ship canal between Houston and Galveston to 32 feet was ordered in May. Oil production in the State underwent an important development in the form of an order of the State railroad commission, effective May 5, limiting to 150,000 barrels a day the quantity of petroleum that might be taken from the wells of the Winkler County pool, and prorating the output according to the potential open-flow capacity of forty-acre tracts taken as units of measurement. The order was made effective for six months. In order to provide a so-called non-cotton zone as a means to combat the boll weevil, an effort was made in the spring to promote the cultivation in west Texas of grain sorghums as replacement for cotton.

The Houston city commissioners passed in January an ordinance annexing the surrounding settlements of Harrisburg, River Oaks, and Memorial, with a population of about 4000 and an area of 5000 acres. Houston was the scene of the Democratic National Convention in the latter part of June. The Houston Electric Company offered in March to sell its property to the municipality, asserting that it could not earn an adequate return on its investment. Figures on waterborne commerce of Texas ports in 1927, sent out by the U. S. War Department gave the commerce of Galveston at 5,848,230 tons, value \$688,005,589; that of Houston, 12,000,414 tons, value \$466,316,967; Port Arthur, 8,021,823 tons, \$175,464,380; Beaumont, 8,068,306 tons, \$137,780,983. Removal of Baylor University from Waco to Dallas was recommended by the education commission of the Baptist General Convention at Dallas, April 28.

ELECTION. The State went Republican for President for the first time. The so-called Hoover Democrats were active opponents of the Democratic presidential candidate, Alfred E. Smith, in the course of the campaign. Two of their number ran for governor in the Democratic primary in August, but were defeated by Governor Dan Moody. An anti-Smith candidate for Lieutenant-Governor was also defeated. In the election of November 6, however, the Hoover Democrats, combined with the Republican voters, gave a slight plurality for Hoover and Curtis, the Republican National candidates; the State's vote was: Hoover, 367,036; Smith, 341,032. Dan Moody Democrat, was reelected Governor, defeating

W. H. Holmes, Republican. The remaining discord over the matters of the Ferguson administration was considered responsible in part for Moody's not attaining the normal Democratic majority. Tom Connelly, Democrat, was elected United States Senator for the ensuing regular term, defeating T. M. Kennerly, Republican, by a majority approximately the same as Governor Moody's. The Democrats retained all their seats in the State's delegation of United States Representatives.

OFFICERS. Governor, Dan Moody; Lieutenant-Governor, Barry Miller; Secretary of State (appointive) Jane Y. McCallum; Treasurer, W. Gregory Hatcher; Comptroller, S. H. Terrell; Attorney-General, Claud Pollard.

JUDICIARY. Supreme Court: Chief Justice, C. M. Cuerton; Associate Justices, T. B. Greenwood, William Pierson.

TEXAS, UNIVERSITY OF. A State institution of higher education at Austin, with a medical branch at Galveston, and a college of mines at El Paso. The main university opened in 1883. For the autumn term of 1928 the enrollment totaled 6209, and for the summer session, 3158. There were 432 members on the faculty, an increase of three over 1927. The endowment resources of the institution amounted to \$21,060,521, and the income from legislative appropriation fees and income from endowment was estimated at \$2,911,140. The library contained 407,552 volumes. President, Harry Yandell Benedict, Ph.D., LL.D.

TEXAS FEVER. See VETERINARY MEDICINE.

TEXTILE INDUSTRY. The textile industry in the United States during 1928 was marked by a decrease in quantity and value of production from 1927, although the figures for actual sales by both wholesale merchants and manufacturers and the department stores showed but

One of the features of the American textile industry in 1928 was the growth of group buying and selling. This was taking on an aspect quite beyond the mere operation of department or chain stores and involved the formation of corporations for group buying from textile merchants for the use of garment manufactures. On the other hand, there were developed selling enterprises, such as a huge department store chain, where a large output could be distributed by retail.

NEW MILL CONSTRUCTION. According to the annual statistics of the *Textile World*, 200 new mills were built in 1928, as compared with 173 in 1927 and 178 in 1926, the distribution in comparison with previous years being indicated in the accompanying table. The statistics showed an increased activity in 1928 in the field of silk and rayon, with 29 new silk mills being constructed as compared with 19 in 1927, and 8 new rayon plants as compared with 5 in the previous year. Many of the silk mills also were weaving rayon either alone or in combinations with silk materials.

As regards States in which new textile mills were built, the summary referred to placed North Carolina at the head of the list, with 39 new plants, 24 of which were knitting mills and the remainder cotton, silk, and miscellaneous. New Jersey had 23 new mills about equally distributed between knitting, silk, and miscellaneous plants. Virginia and Pennsylvania built as many new wool plants as did New England. In Alabama, 15 new cotton mills were built. Pennsylvania had 3 new woolen plants, and Virginia 3 rayon manufacturing plants.

While cotton-mill construction was on about the same basis as in 1924, 1925, and 1926, it was notable that only 4 of the 37 new mills in 1928 were in the North, 1 in Massachusetts, 1 in New

NEW TEXTILE MILLS BUILT IN THE UNITED STATES, 1918-28

[From *Textile World*]

	1928	1927	1926	1925	1924	1923	1922	1921	1920	1919	1918
Cotton	37	23	34	40	39	74	57	46	89	74	29
Wool	12	10	9	17	15	38	34	36	30	54	24

Total	200	173	178	239	186	232	238	242	264	289	254

little change. Intense competition prevails within the industry and studies were being made of changing conditions. The wool industry in particular seemed to be stabilized during 1928 with sufficient production to meet demands and yet to maintain prices. In the manufacture of cotton products, there was more price variation with production at times increasing over total demand. The consumption of wool and cotton during the year showed curtailment of approximately 3 and 11 per cent, respectively, from 1927. The silk industry in 1928 showed little progress, either in volume or prices, though there was a gain of 3½ per cent in consumption by manufactures, but it was quite manifest that still further changes were required before the adjustment to the growing use of rayon was complete. Rayon as discussed under that head, continued its important growth and had become no mean factor in the world's textile situation, with increased consumption sometimes in spite of depressed conditions.

Jersey, 1 in Rhode Island, and 1 in Wisconsin. The increase of 14 over the previous year was accounted for by the Southern States, in which there were also extensive enlargements and additions. The largest Southern mill construction of the year was that of the Alabama Mills Company with headquarters at Birmingham, and 10 plants in other places.

In 1928 there were 12 new wool mills located in Massachusetts, Rhode Island, Pennsylvania, Utah, and Virginia, with 2 in Canada; while Massachusetts, Rhode Island, and Pennsylvania also reported enlargements and improvements. The increase in the number of new knitting mills from 70 to 130 was accounted for by 24 new plants in North Carolina, 16 in Pennsylvania, 7 each in Tennessee and New Jersey, 6 in Georgia, and 4 in Canada. Pennsylvania also led in enlargements and improvements with 139 projects.

There were 7 new silk mills built in New Jersey in 1928 and 4 new mills each in Penn-

sylvania, North Carolina, and Texas. In Virginia, 3 new mills were built, while 7 other States had one each. In Pennsylvania 15 projects for enlargement and improvement were under way.

Of the 8 new rayon plants built during 1928, 3 were located in Virginia and 1 each in Georgia, Massachusetts, North Carolina, Rhode Island, and Pennsylvania. Enlargements and improvements to 5 existing plants also were reported.

Under the head of miscellaneous, 36 new plants were reported during 1928 of which 23 were dyeing, bleaching, and finishing plants; there were 5 braid, 2 bagging, 4 fabric mills, with 1 flax mill and 1 asbestos plant. There were 50 miscellaneous enlargements and improvements reported during the year, 14 being reported in New Jersey, and of the total, 39 involved dyeing, bleaching, and finishing plants.

In the cotton-spinning industry on Dec. 31, 1928, according to the U. S. Census, there were in place 35,264,046 cotton-spinning spindles with 30,622,172 active during the month; the latter number to be compared with 30,596,840 for November, 30,315,086 for October, 28,227,090 for September, 28,243,508 for August, 28,159,676 for July, and 31,722,276 for December, 1927. The accompanying table, also from the Census, shows the total number of cotton-spinning spindles in place and the number active during December, 1928, arranged by States.

States	Spinning Spindles	
	In place December 31	Active during December
United States	35,264,046	30,622,172
Cotton-growing States	18,615,284	17,931,892
New England States	15,137,526	11,411,822
All Other States	1,511,236	1,278,458
Alabama	1,709,404	1,614,276
Connecticut	1,121,464	1,041,168
Georgia	3,078,126	2,975,048
Maine	1,058,872	750,108
Massachusetts	9,109,084	6,609,332
Mississippi	177,118	147,446
New Hampshire	1,414,086	993,900
New Jersey	373,936	339,220
New York	754,160	620,330
North Carolina	6,196,208	5,921,054
Rhode Island	2,317,116	1,900,998
South Carolina	5,512,250	5,445,098
Tennessee	602,452	583,782
Texas	281,908	247,224
Virginia	709,056	679,254
All Other States	848,806	753,934

The cotton industry in 1928 experienced a serious strike at New Bedford, Mass., which tied up 56 mills for 25 weeks. (See STRIKES AND LOCKOUTS.) Notwithstanding the decreased production due to this cessation of work, the industry did not experience any price improvement. The Cotton-Textile Institute continued to function during the year, particularly seeking to regulate production to demand and consumption.

During the year, a feature of the American wool industry was the formation of the Wool Institute which, representing the members of the trade, aimed to develop cooperation in the solution of problems and the correction of abuses. It proceeded to take up the collection and distribution of statistics of production, sales, unfilled orders, and stocks, so that there would be available for mill men and selling agents adequate data on which to plan their various activities. Another event of the year was the

liquidation of a number of mill organizations and the sale of machinery either obviating other equipment or increasing the plants of stronger organizations. During the year, there was not much fluctuation in the general price level of fabrics.

EXPORTS. The exports of textile fibres and manufactures in 1928 aggregated \$1,124,495,000, a gain of 10 per cent, or a substantial increase over the value exported in 1927, \$1,021,357,000. Raw cotton, including linters, aggregating 8,546,419 bales valued at \$912,849,000, accounted for 81.8 per cent of the total values of the textile group in 1928. The exports of raw cotton decreased 7 per cent in volume over 1927, but gained in value 11.5 per cent. Germany, with cotton valued at \$217,891,000, was the leading customer, followed by the United Kingdom with \$211,399,000, the shipments to the latter country increasing from 1,648,175,000 bales in 1927 to 1,997,395,000 bales in 1928. See COTTON.

Excluding raw cotton and linters, the total value of exports of all classes of textile fibres and manufactured products increased from \$195,051,000 in 1927 to \$240,486,000 in 1928, a gain of 4.8 per cent. The 1928 total, according to *Commerce Reports*, included the following principal groups with their respective values: Cotton semi-manufactures, \$24,233,000; cotton manufactures, \$11,418,000; silk manufactures, \$18,648,000; coated or waterproofed fabrics, \$8,500,000; rayon manufactures, \$6,351,000; wool manufactures, \$4,870,000; jute manufactures, \$3,746,000; cordage, except of cotton or jute, \$4,655,000; hats and caps, \$4,037,000; linoleum and felt-base floor coverings, \$3,028,000; and absorbent cotton, gauze, and surgical dressings, \$2,238,000. With the exception of rayon manufactures, the value of each of the foregoing groups was greater in 1928 than in 1927.

The United States exports of cotton cloth, duck, and tire fabrics in 1928 aggregated 546,863,000 square yards, valued at \$79,296,000, as compared with 565,021,000 square yards, with a value of \$76,256,000, in 1927—a loss of 3 per cent in quantity but a gain of 3 per cent in value. The latter percentage reflects an advance in the average unit price of the goods exported from \$0.136 in 1927 to \$0.145 in 1928.

The exports of all classes of hosiery totaled 5,866,091 dozen pairs, valued at \$19,000,000, in 1928, compared with 6,287,078 dozen pairs, worth \$19,302,000, in 1927. The value of silk-hosiery exports increased from \$8,021,000 in 1927 to \$9,658,000 in 1928, while the value of shipments abroad of cotton hosiery dropped from \$7,330,000 to \$6,728,000 and of rayon hosiery, decreased from \$3,951,000 to \$3,613,000. Of the total value, \$19,999,000 in 1928, women's hosiery accounted for \$14,830,000, men's socks for \$3,711,000, and children's hosiery for \$1,458,000. Silk hosiery represented about 60 per cent of the shipments of women's hosiery abroad in 1928.

Cotton hosiery was the most important in the exports of both men's and children's hosiery. The principal markets in 1928, from the standpoint of the value of the hosiery exported, were as follows: Australia, \$2,070,000; Cuba, \$2,037,000; British South Africa, \$2,010,000; Argentina, \$1,588,000; Canada, \$1,588,000; and the United Kingdom, \$1,300,000. Australia, British South Africa, and Argentina were the largest export outlets for American-made silk hosiery,

while the principal foreign markets for both cotton and rayon hosiery were Cuba, South America, and Canada.

American clothing manufacturers were gradually developing export interest and the shipments of wearing apparel in 1928 showed some gratifying increases. The most important gains over 1927 were as follows: Exports of knitted-wool bathing suits rose in value from \$342,000 in 1927 to \$723,000; cotton overalls, breeches, and pants from \$166,000 to \$421,000; cotton dresses, skirts, and waists from \$229,000 to \$511,000; silk dresses, skirts, waists, and blouses from \$1,182,000 to \$1,818,000; and women's and children's wool clothing from \$373,000 to \$456,000.

IMPORTS. In the year 1928 the United States imported textile fibres and manufactures thereof amounting to \$919,918,000, or a decrease of 3.6 per cent from \$954,453,000, the value in 1927; 60 per cent of the total value of the imports in the textile group in 1928 were accounted for in unmanufactured textile fibres, namely, raw cotton, jute, flax, hemp, manila, sisal, henequen, kapok, other vegetable fibres, wool, mohair, animal hair, human hair, raw silk, and rayon. The imports of raw cotton amounted to 172,037,000 pounds, valued at \$42,797,000, against 205,609,000 pounds, valued at \$45,669,000 in 1927. These imports of raw cotton included types not produced in sufficient quantities in the United States, and Egypt was the leading source, supplying 89,231,000 pounds, or 51.9 per cent of the total imports, as against 122,776,000 pounds, or 59.7 per cent, in 1927. Egypt, however, furnished an even greater percentage than indicated, as the bulk of the importation from the United Kingdom, 8,598,000 pounds in 1928 and 13,388,000 pounds in 1927, was of Egyptian origin. Other sources of raw cotton in the order named were China, Mexico, British India, and Peru.

The imports of raw wool into the United States decreased both in quantity and value in 1928 from the amounts in 1927. There were imported in 1928, 240,360,000 pounds, valued at \$77,727,000 as against 264,507,000 pounds in 1927 valued at \$81,754,000, a loss of 9 per cent in quantity and of almost 4 per cent in value. All of the leading supplying countries with the exception of British India and China showed a decline, the leading imports being as follows: The United Kingdom, 49,906,000 pounds in 1928, as against 61,238,000 pounds in 1927; Australia, 26,347,000 pounds in 1928, as against 39,389,000 pounds in 1927; Argentina, 22,865,000 pounds in 1928, as against 27,588,000 pounds in 1927; Uruguay, 6,862,000 pounds in 1928 and 16,828,000 pounds in 1927; Canada, 7,539,000 pounds in 1928 and 9,021,000 pounds in 1927; and British South Africa, 4,410,000 pounds in 1928, and 5,591,000 pounds in 1927. British India, China, and Hong Kong increased their imports of carpet wool by 2,719,000 and 5,931,000 pounds, respectively, over 1927.

Among the textile materials imported into the United States, raw silk is the largest and in 1928 showed an increase in quantity, but a decrease in value, the receipts in the earlier year amounting to 74,204,593 pounds, valued at \$390,365,475 as compared with 75,489,315 pounds, valued at \$367,997,250 in 1928, there being a drop in the average import price per pound from \$5.275 in 1927 to \$4.875 in 1928, which was the lowest unit value for any year's imports of raw

silk since 1916, when the average import price per pound was \$4.46. In 1928 Japan supplied 64,111,650 pounds of the raw silk imported, or 85 per cent, and China, 10,527,407 pounds, or 14 per cent. In 1927 Japan supplied 61,796,651 pounds, or 83.5 per cent, and China, 10,787,770 pounds, or 14.6 per cent. See **SILK**.

The United States for its raw supplies in the textile industries other than raw cotton, is dependent upon foreign sources, so that jute, flax, hemp, and other fibres figure in the imports as well as manufactured articles derived from these materials. Imports of jute and manufactures thereof into the United States increased in value from \$90,087,000 in 1927 to \$101,276,000 in 1928. Raw jute and burlap came principally from India. The imports of unmanufactured jute, including jute butts, declined in quantity from 92,415 tons in 1927 to 90,049 tons in 1928, and in value from \$12,154,000 to \$11,657,000 in 1928. On the other hand burlaps in 1928 amounted to 619,981,000 pounds, valued at \$80,086,000 in 1928, as compared with 569,649,000 pounds, valued at \$67,249,000 in 1927.

Unmanufactured flax was imported to the amount of 5539 tons in 1928, as against 4496 tons in 1927, and imports of hemp amounted to 1634 tons in 1928 as against 1697 tons in 1927. Manufactures of flax, hemp, and ramie imported into the United States declined in value from \$52,608,000 in 1927 to \$46,415,000 in 1928. In 1928 as usual, linen accounted for the greater amount of the fabric which aggregated \$23,342,000 with laces and embroideries amounting to \$6,726,000, handkerchiefs, \$5,800,000, and towels and napkins, \$3,179,000.

Other fibres entering into the textile industry than those already discussed were reported to the amount of 35,569,000 tons in 1928, as compared with 39,286,000 tons in 1927. The quantity aggregated 215,743 tons and 206,009 tons in the two years, respectively, cordage fibres constituting a large bulk of this material which included manila or abaca from the Philippines, sisal and henequen from Mexico and The Netherlands, istle from Mexico, New Zealand fibre from New Zealand, and kapok from Java and Madura.

Notwithstanding the very large domestic production of rayon estimated for 1928 at approximately 98,000,000 pounds (see **RAYON**), the United States during the year imported 12,742,000 pounds of foreign rayon yarns valued at \$10,906,000, as compared with 16,236,000 pounds, valued at \$13,664,000 in 1927. Of the imports of rayon yarn, about 37 per cent came from Italy, 27 per cent from Germany, 17 per cent from France, 12 per cent from The Netherlands, and smaller amounts from Belgium, Switzerland, Austria, and the United Kingdom.

The United States in 1928 increased its imports of textile manufactures from the value of \$5,397,000 in 1927 to \$6,323,000 in 1928, there being included in the latter figure \$3,012,000 worth of cotton waste and \$3,290,000 of yarns and warp. The value of foreign cotton manufactures brought into the United States in 1928 amounted to \$62,791,000 as against \$60,800,000 in 1927. In 1928 imports including cotton cloth amounted to \$15,840,000; miscellaneous cotton fabrics, \$9,119,000; wearing apparel, \$16,985,000; and laces, embroideries, etc., \$11,252,000. There was a decline, however, in the imports of cotton cloth which came principally from the United Kingdom, but an increase in value. The

United Kingdom supplied 36,237,000 square yards in 1928 with Switzerland second with 13,546,000 square yards, and lesser amounts coming from Czechoslovakia, France, and Germany.

The imports of wool semi-manufactures in 1928 were valued at \$16,131,000, as compared with \$14,579,000 in 1927, and the principal items were wool noils valued at \$6,333,000, wool rags, flocks, and mungo valued at \$655,000, and wool waste valued at \$2,691,000. The wool manufactures imported into the United States in 1928 totaled in value \$62,260,000, including woven fabrics and mohair, \$19,285,000, carpets and rugs, \$21,454,000, and wearing apparel, \$18,415,000. The United Kingdom sent to the United States 871,000 pounds of worsted and 6,587,000 pounds of woollens out of total imports of 1,191,000 pounds of worsted and 8,677,000 pounds of woollens.

There were imported in 1928, 3,185,000 square yards of wool carpets and rugs valued at \$21,454,000 of which Persia supplied 968,000 square yards valued at \$8,275,000; China and Hong Kong, 400,000 square yards valued at \$2,960,000; Turkey in Asia and Europe, 377,000 square yards valued at \$1,956,000; the United Kingdom, 277,000 square yards valued at \$1,636,000; and Greece, 130,000 square yards valued at \$1,208,000.

There was a decline in the value of silk manufactured goods from \$42,234,000 in 1927 to \$41,298,000 in 1928. Broad silks amounting to 3,448,000 pounds valued at \$16,426,000 were imported in 1928, of which Japan supplied 2,040,000 pounds valued at \$6,724,000. France, Switzerland, China, Hong Kong, and Italy were other sources of silk fabrics. Pile fabrics, notably velvets, increased from 708,000 pounds, valued at \$4,596,000 in 1927, to 1,048,000 pounds, valued at \$7,579,000, in 1928. Silk wearing apparel imported in 1928 amounted in value to \$7,653,000, France supplying the bulk of the imports. Silk laces and embroideries to the value of \$4,081,000 were imported in 1928.

THEATRE. Whatever distinction accrues to the year 1928 in the American theatre must be of a negative character. Its most salient feature was the unprecedented dearth of good stage material and it will probably pass into history as among the least profitable periods on record. The situation was already making itself felt when the year commenced and continued with increasing force throughout the twelvemonth. Yet, strangely enough, despite the shortage of worthwhile plays, the building of new theatres in New York City went on as usual, with the result that before the close of the year, and at the height of the season, several stood vacant, a condition quite new to the New York stage.

The outcome of the matter was that almost anything in the form of a play could get itself produced, but as the public refused to modify its standards of amusement, the casualties became more and more numerous. Audiences dwindled correspondingly; people seemed to be getting out of the habit of theatre-going and producers everywhere were bemoaning the sad state of their business—all but the fortunate few who could boast of successes and were harvesting the receipts accordingly.

An exception to the general charge of mediocrity must be made in favor of the musical comedies, which averaged higher in quality than usual and prospered in consequence. Among the best were *Rosalie*, *The Three Musketeers*, *Rain*

or *Shine*, *The New Moon*, *Good Boy*, *Hold Everything*, *Three Cheers*, *Animal Crackers*, and several items in the customary quota of *Follies*, *Vanities*, and other forms of the revue type. One of the cleverest of these was the *Grand Street Follies*; another was *This Year of Grace*. The latter provided the incomparable Beatrice Lillie with the medium for her comic genius which she had been seeking ever since the last of the *Charlot Revues*. Associated with her as both author and co-star was Noel Coward who had previously supplied many of the skits in which she had appeared with such hilarious effect. There was also *Paris* written to the measure of the piquant and Gallie Irene Bordonni.

Beyond these, and among the regular plays, few reached even the goal of one hundred performances which in itself constitutes but a moderately fair run for New York—the standard by which an American success must be gauged—in this day and generation. To keep the theatres open, recourse was had to an uncommonly large number of return engagements of the more recent hits, but these seldom elicit much patronage even in normal times, much less when used as stop-gaps. It was noticeable that nearly all the plays which did achieve success were the work of experienced, established authors, but not all the output from this class was successful.

The murder-mystery type of melodrama was especially prevalent during the first half of the year, though not particularly popular; wherefore examples grew less frequent after the summer lull. In fact, only *The Silent House*, by John G. Brandon and George Pickett, a thriller made exceptionally sinister by the use of Chinese characters and trappings, and *The Perfect Alibi*, by A. A. Milne, done in England as *The Fourth Wall*, could be reckoned as genuine hits, though *Cock Robin*, by Philip Barry and Elmer Rice, did reach the century mark.

Philip Barry's *Paris Bound* and *The Royal Family* of George S. Kaufman and Edna Ferber, brought out Dec. 27, and Dec. 28, 1927, respectively, and discussed in the 1927 YEAR BOOK, continued among the successful plays of 1928.

The Theatre Guild produced the first important play of the year—Eugene O'Neill's *Marco Millions*, a fairly spectacular piece in which heart-breaking proclivities are attributed to the world's first commercial traveler, Marco Polo. This was followed by another O'Neill drama, *Strange Interlude*, which, first done at the end of January, was still running prosperously as the year ended. Moreover, the Pulitzer Prize for the most meritorious and significant play by an American author was awarded for the season of 1927–28 to this work—a verdict with which many thinking critics seriously disagreed. The play deals with preëminently psychopathic matters, ending in a rather vain attempt at symbolism. The play is in nine acts with its characters not merely speaking the customary dialogue but also voicing their inmost thoughts in parallel columns, as it were, while the action waits.

The Theatre Guild, no longer an experimental art group but rather a highly commercial, shrewd and prosperous organization, went O'Neill one better in staging the piece by starting the performances at 5.30 in the afternoon and continuing until 11 with an intermission of an hour and a half for dinner.

The season's profitable offerings also included *Diamond Lil*, by Mae West; *The Front Page*, an

"PARIS BOUND"

Madge Kennedy, Donald MacDonald, and Donn Cook

amusing portrayal of newspaper life, by Ben Hecht and Charles MacArthur; another newspaper comedy by Ward Morehouse entitled, *Gentlemen of the Press*; *Jarnegan*, a dramatization of Jim Tully's novel of Hollywood and the moving-picture industry, with Richard Bennett in the main part; and, to a lesser degree, *Jealousy*, of which further mention will be made later.

Revivals were frequent but, as usually happens unless equipped with casts bristling with great names, met with scant favor. Somerset Maugham's play *Our Betters* had, however, the unique distinction of far surpassing, in a revival, the record of its original presentation ten years before. This comedy is a scathing arraignment of the wealthy American women who go title-seeking to London, and was quickly and tactfully withdrawn soon after its first showing as not conducive to the cordiality of inter-allied relationships in time of war. Brought to light again in February, 1928, the piece proved a real drawing card, partly by virtue of the clever performances of Ina Claire and Constance Collier.

Another praiseworthy, though less successful, revival was that of Galsworthy's *The Silver Box*, one of the first of his plays to be done in New York when presented by Ethel Barrymore for a few performances some two decades previously. Isobel Elsom, a talented young English actress, and James Dale handled the chief rôles capably, but New York demands bigger names for popularizing the older plays.

Diversion, a second piece by John Van Druten, whose *Young Woodley* had created so favorable an impression, proved disappointing, in spite of excellent work by a cast mainly British, including Richard Bird, Cathleen Nesbitt, and Sir Guy Standing. It was handicapped by a grim ending, too late revised to a less dismal outcome.

The final production of the Theatre Guild for the spring season was a modern adaptation, via Germany, of Ben Jonson's *Volpone*, or *The Fox*, with the Elizabethan flavor somewhat modified. This came as a genuine novelty. Robert E. Sherwood, author of *The Road to Rome*, one of the hits of the previous season, followed this with an amusing satire on modern Continental monarchies, involving a particularly pointed dig at the recent visit of Elizabeth of Rumania to the United States. Its title was *The Queen's Husband*, and Roland Young was the star.

George M. Cohan enjoyed, as author, moderate success with a farce called *Whispering Friends*, while *Rope*, a dramatization of T. S. Stribling's story, *Teeftallow*, though providing an interesting and atmospheric picture of the ignorance, prejudice, and fanaticism prevalent in the Tennessee mountains, was nevertheless unable to catch the popular fancy.

Even so experienced a playwright as Zoë Akins failed to achieve success with a nondescript piece entitled *The Furies*, in spite of the presence of no less a personage than Laurette Taylor as its star. The work is remembered chiefly as the basis of the year's most perfect caricature, introduced by Albert Carroll in the *Grand Street Follies*.

Two comedies whose announcements appeared almost simultaneously were a dramatization of Floyd Dell's novel, *An Unmarried Father*, and an original piece by Edward Childs Carpenter entitled, *The Bachelor Father*. The latter, sponsored by David Belasco, was the first to reach

the stage, while the former, whether or not by reason of the similarity of name, which was as far as the resemblance went, was withheld until the close of the other's successful run in the early fall, when it was put forth as *Little Accident*, and in its turn scored a hit. Granted the sophistication of topic in each case, both plays handled highly diverting situations without offense and were thoroughly enjoyable.

By late spring, the general apathy toward the stage was quite possibly responsible for the brevity of the life of a pleasant trifle by Harrison Owen—*The Happy Husband*—wherein Billie Burke, as star, obligingly divided the honors with A. E. Matthews, Lawrence Grossmith, Walter Connolly, and Irene Browne.

Also late in spring came the classic revivals with their imposing star casts, to which allusion has already been made. They consisted of the periodically recurrent *She Stoops to Conquer* and *Diplomacy*, the former most engagingly performed, the latter not so well as on certain previous similar occasions; after which The Players came forth with a genuine novelty for the club's annual week's festival in an Elizabethan comedy, Farquhar's *The Beau's Stratagem*.

Shakespeare was represented during the year, in so far as New York was concerned, by but four productions, of which three came before summer. The first was Winthrop Ames' beautiful mounting of *The Merchant of Venice* with George Arliss as a highly interesting Shylock and Peggy Wood a captivatingly girlish Portia; then came Walter Hampden's imposing and ponderous presentation of the historical pageant of *King Henry the Fifth*, which the public evidently did not crave to see. This in turn was followed by a limited three weeks' engagement of *The Merry Wives of Windsor* with Mrs. Fiske, Otis Skinner, and Henrietta Crosman infusing new life and zest, as well as unaccustomed refinement, into the usually tedious old comedy. In the autumn, *Macbeth* was put on with Lyn Harding, Florence Reed, Basil Gill, and William Farnum in the principal parts and with stage settings designed by Gordon Craig.

With the arrival of autumn and a new season, the tendencies and conditions already noted, particularly the prevalent mediocrity, became still more pronounced. To every even half-way success there were fully three failures, except among the musical productions, where the hits and the casualties were about evenly balanced.

Of the two plays already mentioned as reflecting phases of newspaper activities, *The Front Page* promptly took its place among the successes, but *Gentlemen of the Press* gave up the struggle before the holidays. Both were unquestionably entertaining in their respective ways entirely aside from their marked vulgarity of utterance, which was proffered as true to the life depicted.

Three pieces designed to appeal especially to baseball and pugilistic enthusiasts went speedily by the board. Of these, *Elmer the Great* was the work of no less popular a humorist and sports commentator than Ring Lardner, while of the two featuring pugilism *The Big Fight* had Jack Dempsey (himself) and Estelle Taylor (Mrs. Dempsey) as the chief performers.

In September another lasting hit made its appearance in Lonsdale's *The High Road*, one of the London successes of the preceding year. This

comedy treated the subject of intermarriage between the aristocracy and the stage from a new and refreshing angle and closed on a note of convincing uplift. Incidentally, it afforded opportunities for very enjoyable acting by Edna Best, Herbert Marshall, Fred Kerr, H. Reeves-Smith, and Hilda Spong, Britishers all.

Another September arrival still current as the year closed was *Jarnegan*, already mentioned for its violent language. *Machinal*, produced at about the same time, was an honest and interesting attempt to tell a straightforward, intelligible, tragic story of cause and effect in terms of ultra-modern, impressionistic drama. Sophie Treadwell was the author and a gifted young actress, Zita Johann by name, was the outstanding player.

Similar in method of staging, but far less direct in its message, which, after all its clumsy and laborious telling, was nothing more than the hackneyed and unquestioned axiom that "riches aren't everything," was *Mr. Moneybags*, by Channing Pollock, who, if the press is to be believed, was greatly disgruntled by the public's failure to be interested and impressed by his sermon.

Gods of the Lightning, by Maxwell Anderson and Harold Hickerson, was a vivid and arresting drama based on the main features of the famous case of Sacco and Vanzetti as the authors interpreted them and arguing against what they conceived to have been a great injustice. But whatever the facts or the merits of the case, the play came too late to be of any service and the theatre-going public seemed content to let the matter remain a closed book—this in spite of highly effective acting by Charles Bickford, Horace Braham, and Leo Bulgakov.

The Actors' Theatre, quiescent for many months, came to life again with the presentation of a simple and unassuming but gripping little domestic tragedy entitled *Exceeding Small*, the work of Caroline Francke. Here the element of popular appeal was not too pronounced and some experimenting was done with the ending as a compromise between art and demand. Eric Dressler and Ruth Easton acquitted themselves with great credit as hero and heroine and the piece remained in view from late October until after Christmas.

In so disastrous a season, a play with but two characters and a single scene was an obvious godsend. Such a one was *Jealousy*, adapted, with seemingly but little change of flavor, by Eugene Walter from the French of Louis Verneuil. Unmistakably Gallic in tone, it contained passages of startling frankness, and supplied an engrossing test of the ability of its diminutive cast to sustain interest in their efforts throughout an entire evening. After various combinations of players had been tried, *Jealousy* finally reached New York with Fay Bainter and John Halliday as the ultimate choice, and they stood the aforementioned test admirably.

Equal, but more sugared, frankness characterized a frothy trifle called *Young Love*, by Samson Raphaelson, author of *The Jazz Singer*, but frankness made so utterly disarming by the spirit in which it was handled by both playwright and actors that it would be difficult seriously to find fault on this score. This piece employed four players, all well versed in the deft, light, comic touch essential to such a case—Dorothy Gish (late of the screen), James Ren-

nie, the boyish Tom Douglas, and Catherine Willard.

Late in October, Walter Hampden reopened his theatre with an elaborate but rather absurd drama depicting episodes in the life of Buddha and entitled *The Light of Asia*. After its extremely brief career, he spent the rest of the year in trying to revive interest in one after another of his successes of recent seasons.

The Theatre Guild also suffered a rebuff with their first offering of the autumn, a ponderous production of Goethe's *Faust*. They soon discovered that their modern style of acting was quite unsuited to the demands of the old legend and discarded the work just as quickly as their subscription arrangements permitted. Their next piece met with rather better success—a revival of Shaw's *Major Barbara*, with Winifred Lenihan and Dudley Digges in the leading rôles, while the third, *Wings Over Europe*, by Robert Nichols and Maurice Browne, proved to be an odd but uncommonly interesting mixture of satire, poetry, symbolism, and melodrama, affording an opportunity, of which full advantage was seized by a young actor named Alexander Kirkland, to exhibit a striking portrayal of a highly imaginative figure. On New Year's Eve, the Guild presented its fourth offering, *Caprice*, from the Viennese of Sil-Vara, with Alfred Lunt and Lynn Fontanne in the principal rôles, making, with *Strange Interlude*, four attractions under its banner running concurrently.

The newest Molnar piece, *Olympia*, with two English favorites and one American—Fay Compton, Ian Hunter, and Laura Hope Crews—in the salient parts, enjoyed but a brief run, due, possibly, in some degree to an unsympathetic finale. Meanwhile, several far less pretentious works, such as *Courage*, *This Thing Called Love*, and *The Grey Fox*, a play centring about the personality of Machiavelli, were settling down to the enjoyment of unexpectedly good fortune.

November brought a gruesome melodrama in the stage version of Hugh Walpole's *Portrait of a Man with Red Hair*, an extraordinarily gripping and uncanny thing which, however, lasted but a brief time despite Edward G. Robinson's vivid acting of Crispin, the sadist. A rather novel mystery play, without a murder, by the prolific Owen Davis, and known as *To-night at Twelve*, was still visible as 1928 passed into history.

The week of November 18 set a record for the glamour of the authors' names represented in its roster of offerings—with plays by Shakespeare, Ibsen, Shaw, Tolstoi, Dumas, and Maugham. The Shakespeare and Shaw items have already received mention above. The Ibsen work was *The Wild Duck*, the second showing of the same play by the Actors' Theatre, with Blanche Yurka again the Gina. The Tolstoi number was the German version of *The Living Corpse*, known also as *Redemption*, in which an effort was being made to exploit Alexander Moissi. While in America the preceding year with the Reinhardt organization, he had scored a distinct success, particularly in this piece. The return engagement nevertheless proved an utter fiasco. Walker Whiteside dug up as his season's vehicle Charles Coghlan's old version of Alexander Dumas' *Kean*, to which the name of *The Royal Box* was attached. Finding it not over-popular, he switched on Christmas night to a new piece dealing with modern Japan—and by the end of that week was ready to switch back again.

The Maugham play was *The Sacred Flame*, an interesting dissertation presenting startling modern slants on two of the Ten Commandments. Too obvious playwriting was conceded as the explanation of its inability to attain success. Jane Cowl, also, figured in that eventful week as both author (or co-author) and star of a saccharine trifle called *The Jealous Moon*, of the Pierrot-Pierrette brand.

Before November ended, a handful of new hits had made their appearance in Philip Barry's *Holiday*, known earlier as *The Dollar*; a comedy by Townsend Martin starring Alice Brady and bearing the misleading title of *A Most Immoral Lady*; a dramatization of Edith Wharton's novel of Old New York, *The Age of Innocence*, with Katharine Cornell as the Countess Olenska; a somewhat lurid, exotic drama for Helen Menken—*Congai*—based on a novel of the same name by Harry Hervey; and A. A. Milne's clever murder mystery, *The Perfect Alibi*.

At the same time came the first of three plays depending for their major effects upon mechanical devices. Austin Strong was the pioneer and, lacking inspiration in the matter of nomenclature, called his contribution *A Play Without a Name*. Its novel feature was a scene purporting to represent, impressionistically, the inside of the hero's brain, and the workings thereof. Mr. Belasco next came forward, after lengthy delays due to the necessity of virtually making over the stage and other parts of his theatre for the occasion, with an adaptation of Molnar's *The Red Mill*, starring Lenore Ulric and called *Mima*. This provided Mr. Belasco with another of his apparently cherished chances to dig in the dirt, as well as to go the limit in the matter of stage effects. The scene was Hell, and the mechanism that virtually filled the stage was a satanic device capable of reducing the veriest saint in one hour to a low moral state such as it would require twenty years of life in a metropolis like New York to attain. Yet virtue was triumphant in the end and the machine collapsed. Sidney Blackmer figured as Miss Ulric's and the Devil's intended victim. And, finally, almost at the tag end of the year, came a prophetic piece with the title of *To-morrow*—a vision of the day when all the comforts of life will be regulated by radio-activity, having for its big scene the first elopement and pursuit by airplane that the drama had yet afforded.

December brought back to New York Ethel Barrymore, after a year of touring, and to a new theatre named for her. The play, *The Kingdom of God*, done into English by the Granville-Barkers from the Spanish of G. Martinez Sierra, was but the first of a series planned for her use during the season of 1928-29. It provided Miss Barrymore with an effective medium for the display of various facets of her resourceful art, but contained few of the elements that make for popular success. Disconnected, save for the recurrent presence of the one character, it depicted three periods in the life of a Sister of Mercy, at the ages of 19, 29, and 70.

December also added three names to the list of enjoyable musical attractions—*Whoopee*, *The Red Robe*, and *The Houseboat on the Styx*, the latter based, of course, on John Kendrick Bangs' droll tale.

During the year the energetic Eva Le Gallienne added some seven new items to her Civic Repertory list, of which five still figured in her

bills at the end of December. These were creditable presentations of Ibsen's *Hedda Gabler*, Molière's *Le Bourgeois Gentilhomme* (called in translation *The Would-Be Gentleman*), Bernard's *L'Invitation au Voyage*, also adapted from the French, Chekhov's *The Cherry Orchard*, and especially for the Christmas season, a revival of Barrie's *Peter Pan*. An important recruit to the acting company was Nazimova.

"Little theatre" groups and amateur organizations were active throughout the United States, as evidenced particularly by the number of entries in the annual tournament for the Belasco Trophy in New York in May. Outstanding events of this category were the awarding of said Trophy to a group from Scotland and of other prizes to aggregations from Georgia; the production by the Pasadena (Calif.) Community Theatre of Eugene O'Neill's *Lazarus Laughed*; and the banning of a projected performance of the Harvard Dramatic Club by the police authorities of Boston.

Inasmuch as the British and the American theatres are so largely dependent upon each other for attractions, it was not surprising that New York conditions were reflected in London during the year. The English, however, are more adaptable to such emergencies by virtue of a greater interest in standard drama and by an absence of the American insistence upon "original casts." It is a frequent occurrence there for plays that have met with special favor to be done again and again by varying aggregations. For instance, a feature of the London season was a repetition of *The Constant Nymph*, with Jean Forbes-Robertson as the Tessa and Raymond Massey as the Lewis Dodd. This same rising young actress was also seen as both Juliet and Ophelia at the reconstructed Old Vic.

Among the importations from the United States presented in London during 1928 were such recent New York hits as *The Trial of Mary Dugan*, *Gentlemen Prefer Blondes*, George Cohan's *The Baby Cyclone*, *The Barker*, *The Command to Love*, the musical *Show Boat* (at the end of December in its second year in New York), *The Road to Rome*, with Philip Merivale the Hannibal in England as in America, *Her Cardboard Lover*, with the English Leslie Howard repeating his American success in the title rôle and Tallulah Bankhead playing opposite, Behrman's *The Second Man*, Channing Pollock's *The Enemy*, and Elmer Rice's *The Adding Machine*; also other pieces of Yankee origin in *March Hares*, *Sauce for the Gander*, and O'Neill's *Welded*.

Macbeth was staged in modern dress with the result that might have been expected. *The Making of an Immortal*, by George Moore, proved a delightful satire on the Shakespeare-Bacon question and the great figures of Elizabeth's day, with Sybil Thorndike as the Virgin Queen, Leslie Faber as Bacon, and Charles Laughton as rare Ben Jonson.

New plays of importance by British writers were Drinkwater's *Bird in Hand*, Milne's *The Fourth Wall* (*The Perfect Alibi* in America), *Blackmail*, *A Man with Red Hair*, *Other Men's Wives*; Edgar Wallace's *The Man Who Changed His Name* (acted by Robert Loraine); a piece by Margaret Kennedy and Basil Dean entitled *Come with Me*; *S O S* by Walter Ellis with Sir Gerald du Maurier; two detective stories dramatized as *Alibi* and *The House of the Arrow*;

Young Ideas, by Major Browning; with Ernest Truex; *My Lady's Will*, by Adelaide and Eden Philpotts; *Thunder on the Left*, adapted from Christopher Morley's novel; *A Damsel in Distress*, by Ian Hay and P. G. Wodehouse; and *The Return Journey* by Arnold Bennett.

Three Spanish plays by the Quinteros, translated by Mr. and Mrs. Granville-Barker, were offered during the fall—*Fortunato*, *The Lady from Alfaceque* and *A Hundred Years Ago*. There were also various productions of plays of Ibsen and Strindberg by Mrs. Patrick Campbell, Robert Loraine, and others; likewise dramas by Lord Tennyson and Bernard Shaw. Frederick Lonsdale figured as co-author of a musical comedy, *Lady Mary*, and a first play by E. F. Benson, founded on his own novel, *The Luck of the Vails*, was proffered by Lady Tree.

In Germany, there was evident a tendency to rely greatly for theatrical entertainment on the products of other countries, with America prominent in the list.

In France, Sacha Guitry wrote and produced a drama entitled simply *Lindbergh*, epitomizing the arrival of the Lone Eagle in Paris at the end of his memorable trans-Atlantic flight. It is difficult to escape the suspicion that M. Guitry's prime object was to capitalize the enthusiastic regard in which the young American aviator is held. For the title rôle, a young Frenchman who was once mistaken for Lindbergh in a Paris crowd was located and trained for his stage début.

For further discussion of European plays see sections on the *Drama* under LITERATURE, ENGLISH AND AMERICAN; FRENCH LITERATURE; GERMAN LITERATURE; ITALIAN LITERATURE, etc.

THEOSOPHICAL MOVEMENT, THE. A movement which is traced by its adherents as far back as historical records extend, and which is discerned wherever thought has struggled to be free, wherever living truth has been stressed as opposed to forms and dogmatism, and which was enunciated and restated by Madame Helena Blavatsky in 1875. The fundamental tenets of the philosophy of Theosophy are (1) the existence of that which is beyond the range and reach of human thought, in which we live and move and have our being,—the source, the container, and the goal of all manifestation; (2) the universal basic law of periodicity, under which one universe succeeds another as day follows night, and rebirth, death; and (3) the fact of universal brotherhood, all being the same in essence and all pursuing the same evolutionary journey toward the attainment of human perfection, exemplified in such beings as Krishna, Buddha, and Christ; each man's character, opportunities, and environment at any given stage being the result of his own past thoughts, desires, and acts. The Theosophical Movement showed considerable activity during 1928, especially in a marked awakening of interest in Theosophy in England, Holland, and France. In Paris during the year, a large and rapidly growing lodge of students was formed who were devoted to the original teachings of Theosophy, distinguished from the many departures therefrom, and William Q. Judge's *Echoes from the Orient* and *Life on the Path* were translated into French. An important publication of the year was *The Real H. P. Blavatsky: A Study in Theosophy and a Memoir of a Great Soul* (London) by William Kingsland.

THEOSOPHICAL SOCIETY, AMERICAN. The American division of the Theosophical Society, a world-wide organization founded in 1875 by Mme. Helena P. Blavatsky and Col. Henry S. Olcott. World headquarters were later established at Adyar, India, near Madras, where the society owns a tract of three hundred acres on the Adyar River, with many beautiful buildings erected to house its extensive library of occult works, its printing plant and business offices, also an auditorium and residences. Since 1875 the organization has spread until in 1928 branches existed in forty-two nations, on five continents. There are the Canadian, Mexican, Cuban, Porto Rican, and United States Theosophical Societies, each taking its local designation from the region in which it exists. The American Theosophical Society was formerly known as the American Section of the Theosophical Society, and in 1928 had 257 local lodges throughout the nation.

The objects of the Society are to form a nucleus of the universal brotherhood of humanity, without distinction of race, creed, sex, caste, or color; to encourage the study of comparative religion, philosophy, and science; and to investigate the unexplained laws of nature and the powers latent in man. It is composed of students, who are united by their approval of the society, by their wish to remove antagonisms due to religion, and to draw together men of good will whatsoever their religious opinions, and by their desire to study religious truths and to share the results of their studies with others. The headquarters were moved to Wheaton, Ill., in 1927, where there has been erected a spacious building on ten acres of ground. This land eventually was to be built up into a beautiful park. The president of the Society for 1928 was L. W. Rogers, lecturer and author of *Elementary Theosophy*, *Dreams and Premonitions*, *Reincarnation*, *The Forces We Generate*, and *Earth's Next Civilization*.

THEREMIN, LEON. See MUSIC.

THOMPSON, EDWARD RAYMOND (E. T. RAYMOND). English editor and author, died at London, April 10. He was fifty-six years old. He received a private education and after working as a journalist at Brighton, Leeds, and elsewhere, joined the staff of the *Star*, of London, in 1897. In 1898 he went to Japan to the *Japan Mail*, of Tokyo. He remained with that paper until 1900, and from 1900 to 1902 was editor of the *Japan Gazette* of Yokohama. In 1904 he returned the England as night editor of the *Daily Mirror*, of London, and he subsequently served on the staffs of the *Standard*, the *Outlook*, and the *Evening Standard*; from 1916 until his death he was editor-in-chief and leader writer of the last-named publication. In 1919 appeared his first book, *Uncensored Celebrities*, in which he displayed a talent for unconventional pen portraiture, especially of political figures. The book was followed by others in the same vein: *All and Sundry* (1919); *Mr. Balfour* (1920); *Portraits of the Nineties* (1921); *Mr. Lloyd George* (1922); *The Man of Promise* (Lord Rosebery, 1923); *Disraeli, the Alien Patriot* (1925); and *Portraits of the New Century* (1927). He published his books under the pen name "E. T. Raymond."

THOMPSON, JAMES WALTER. American advertising specialist, died at New York, October 16. Born in 1847, he at first was connected with the advertising office of William J. Carlton

in 1864, and several years later he acquired control of the business. He was so successful in interesting merchants in the extensive use of advertising media, that he eventually secured a practical monopoly of the sale of magazine advertising. Through his realistic and interesting pictures, and nation-wide selling campaigns, he gradually overcame the aversion of magazine proprietors and editors to what had been considered vulgar commercial propaganda. He also instituted the syndicating of advertising material by acquiring advertising rights from various newspaper chains throughout the country, and distributing in wholesale fashion the appeals of his clients. Before he retired, in 1916, he had developed the reputation of a number of commodities so that the purchasing public had become widely familiar with them, and magazine editors sought the advantage of dealing with his organization.

THORNYCROFT', SIR JOHN ISAAC. English naval architect, died at Bembridge, Isle of Wight, England, June 28. He was born at Rome, Feb. 1, 1843; his father, mother, and maternal grandfather were all sculptors of distinction, and his brother, William Hamo Thornycroft (1850-1925), was especially noted in that profession. He was educated at a private school and at Glasgow University. He early showed an aptitude for mechanics, and at 18 built a steam launch, *Nautilus*, which was the fastest boat of its kind on the Thames. Still earlier he had constructed a small model steamboat which contained several improvements on existing vessels; he later embodied the innovations in torpedo boats which he built for the British Government. He opened a shipyard at Chiswick in 1866, and achieved remarkable success as a builder of torpedo boats. Among his improvements were the closed stoke-hole and fan, a special indicator, a water-tube boiler, and the turbine propeller. Early in the World War he conceived the idea of building small torpedo boats of high speed and such shallow draft that they could pass safely over mine fields. More than 100 such boats were constructed for the British Navy, and gave good accounts of themselves at Zeebrugge, Ostend, and elsewhere. The Thornycroft works constructed commercial vessels as well as warships, and Sir John (who was knighted by King Edward in 1902) established automobile works also, and invented sugar-making machinery. Glasgow University conferred on him the honorary degree of LL.D. in 1901. He was elected a fellow of the Royal Society in 1893 and was a member of the Institution of Naval Architects and of the Institution of Civil Engineers.

THURIN'GIA. A federated state of the German Republic, created at the end of 1919; comprising the following states of the former German Empire: Eisenach, Gotha, Reuss, Saxe-Altenburg, Saxe-Meiningen, and Saxe-Weimar, with Schwartzburg-Rudolstadt and Schwartzburg-Sondershausen. Area, 4536 square miles; population, according to the census of 1925, 1,609,300. Capital, Weimar, with a population in 1925, of 45,957. Other large towns with their populations at that date were, Gera, 81,402; Jena, 52,649; Gotha, 45,780; Eisenach, 43,385. The arable land is estimated at 44 per cent of the total area. The acreage and production of the principal crops in 1926 were: Wheat, 153,791 acres, 97,702 tons; rye, 183,808 acres, 103,370 tons; oats, 205,907 acres, 145,755 tons; po-

tatoes, 162,302 acres, 590,124 tons. The government is under a diet, which acts through a state council. In the elections held in January, 1927, the following parties were returned: Conservative bloc, 19; Socialists, 18, Communists, 8; other parties, 6. The executive authority is entrusted to the president of the state council. The President of this council in 1928 was Dr. Leuthusser.

TIBET, ti-bët' or tib'et. A region extending eastward from the Pamirs to the border of China; between the Himalaya and Kwenlun Mountains; nominally under the suzerainty of China. Area, estimated at 463,200 square miles; population, variously given, at 1,500,000 to 6,000,000, the probable figure being about 2,000,000. Capital, Lhasa, with a population of 15,000 to 20,000. Lamaism is the prevailing religion. The chief pursuits are pastoral and the animals raised include sheep, yak, buffaloes, pigs, and camels. Some agriculture is carried on, the products including barley and other cereals, pulse, and vegetables. There is considerable activity in the industries of wool spinning, weaving, and knitting. Of the minerals, gold, borax, and salt are mined to some extent. Trade is chiefly with India and China.

TIERNEY, RICHARD HENRY. American Roman Catholic clergyman and editor, died at New York, February 10. He was born at New York City, Sept. 2, 1872. He was graduated from St. Francis Xavier College, New York, in 1892, and entered the Society of Jesus at Frederick, Md., in the same year. He studied for seven years at Frederick and at Woodstock College, Maryland, and then taught for five years, two at Gonzaga College, Washington, D. C., and three at Holy Cross College, Worcester, Mass. In 1904 he returned to Woodstock for his theological courses and after his ordination in 1907 he devoted two more years to theology at Woodstock; these were followed by the third year of his novitiate at Linz, Austria. On his return to the United States in 1910, Father Tierney taught philosophy at Woodstock until, in 1913, he became a member of the editorial staff of *America* (a national Roman Catholic weekly). In March, 1914, he became editor-in-chief, and he held that position until 1925, when he was incapacitated by illness from all further work. Besides editing *America*, he was editor of *Catholic Mind* and a contributor to the *American Catholic Quarterly*, the *American Ecclesiastical Review*, and other publications, and he lectured on the psychology of education. He was prominent in the work of various Roman Catholic educational, historical, and religious associations.

TIN. In 1928 there were substantial increases in both the production and consumption of tin throughout the world. It was estimated that with the increased production the output for the year amounted to nearly 136,000 tons, or approximately 15 per cent more than in 1927, when the U. S. Bureau of Mines estimated the world's output at 158,769 long tons. The Federated Malay States are the leading sources of the world's tin, exporting in 1927 52,180 tons, with 1988 tons from the Unfederated Malay States. In 1928 it was estimated that the Federated Malay States would show an increase of approximately 20 per cent, or about 10,000 tons, with a slight decline in the output of the Dutch East Indies whose production in 1927 was stated at

33,935 tons. In Bolivia, which in 1927 produced 36,707 tons, there was a substantial increase estimated at about 12 per cent due in large measure to the development of the Patiño Mines and Enterprises Company. The year's shipments were estimated at about 39,000 tons and Bolivia for 1928 again was able to show a record production. Nigeria, which in 1927 had a production of 8056 tons, was expected to show an increase of 10 to 11 per cent. In England, Cornwall, which in 1927 produced 2593 tons, maintained about the same rate in 1928 with conditions more stabilized and prospective extensions of the tin-mining activities being considered. The total visible supply of tin on Dec. 31, 1927, was given at 15,474 long tons and on Dec. 31, 1928, at 23,605 long tons. The total supplies during the year 1928 were estimated at 135,960 tons, as against 118,134 tons in 1927. The total deliveries for 1928 were 127,867 tons, as against 118,841 tons in 1927. The prices in New York ranged from a maximum of 50 cents at the close with a lower point occurring in June and July. In 1927 the average was 64.37 cents.

Tin imports into the United States in 1928 amounted to 130 tons of ore with tin contents which was valued at \$69,227, as compared with 122 tons valued at \$79,089 in 1927; and 174,653,760 pounds of tin in such forms as bars, blocks, and pigs, valued at \$86,983,174, as compared with 159,357,110 pounds valued at \$100,865,205 imported in 1927. The chief sources of the latter products were as follows: British Malaya, 117,132,573 pounds valued at \$58,334,442; the United Kingdom, 27,322,536 pounds valued at \$13,288,565; The Netherlands, 16,022,782 pounds valued at \$8,229,377; Hong Kong, 4,868,656 pounds valued at \$2,487,924; Australia, 1,716,422 pounds valued at \$845,978; Netherland East Indies, 756,212 pounds valued at \$401,264; and other countries, 6,834,670 pounds valued at \$3,395,624.

TIMBER. See FORESTRY.

TIROL. See TYROL.

TOBACCO. The 1928 crop in the United States was grown on a considerably increased area compared with the 1927. The acreage was 1,912,100, only twice exceeded. The production of 1,373,501,000 pounds was likewise larger than in 1927, although the per-acre yield was smaller, and the total output was about 2 per cent above the average for 1922-26. The increase in production affected nearly all types, being especially pronounced in Burley, the dark tobaccos of western Kentucky and Tennessee, and the cigar types. Flue-cured tobaccos showed an increase of about 1 per cent, while Virginia dark-fired and Maryland export showed decreases. Lower prices gave the crop a less farm value than in 1927 or most recent years. North Carolina led in production, with 475,239,000 pounds, followed in order by Kentucky, 306,000,000; Virginia, 111,600,000; Tennessee, 88,459,000; Georgia, 84,387,000; South Carolina, 82,288,000; Pennsylvania, 49,580,000; Wisconsin, 49,025,000; Ohio, 33,440,000; Connecticut, 29,750,000; and Maryland, 21,700,000 pounds.

In November, 1928, the International Institute of Agriculture reported the world tobacco production, with statistics available, at 1,809,276,000 pounds, as compared with 1,474,597,000 pounds in 1927. The United States was by far the largest producer, growing fully three-fourths of the world crop. It was followed by Japan, with

an estimated production of 147,159,000 pounds; Bulgaria, about 43,000,000; and Canada, about 41,000,000.

Receipts from internal revenue taxes on tobacco in the United States for the fiscal year 1928, as reported by the Commissioner of Internal Revenue, reached a new high mark of \$396,450,041.03, an increase of \$20,279,835.99 over the previous year. The amount collected from this source in 1928 exceeded the total internal revenue receipts from all sources in any year prior to 1915. Collections on small cigarettes comprised 76.11 per cent of the total tobacco taxes, the amount showing a record figure of \$301,752,588.34, an increase of \$22,824,026.53 compared with the previous year. Another record was established by the collection of \$7,461,354.90 in taxes on snuff, an increase of \$553,090.26 compared with the previous year. The steady increase in the consumption of snuff is unaccounted for, unless it has to some extent supplanted chewing tobacco. The receipts from taxes on chewing and smoking tobacco amounted to \$62,774,542.43, a decrease of nearly \$2,300,000. Collections from taxes on large cigars amounted to \$22,879,374.93, also representing a considerable decrease. Nearly 90 per cent of the total tobacco tax receipts were collected in North Carolina, Virginia, New York, Pennsylvania, New Jersey, Ohio, and California, in the order named, North Carolina contributing nearly 60 per cent.

A change in tobacco habits during the World War had led to the replacement of chewing and smoking tobacco by cigarettes. The Bureau of Internal Revenue reported that in the calendar year 1927 nearly one hundred billion cigarettes were manufactured weighing three pounds or less per thousand, an increase of about 8 per cent over the preceding year. The per-capita tax paid on account of tobacco had steadily increased in 10 years. For the fiscal year 1928, it amounted to \$3.30, compared with \$3.17 in 1927, and a little less than \$3 in 1925. Of the amount for 1928, \$2.51 was on account of cigarettes.

Cigarette smoking had shown a large increase the world over. In England it was steadily replacing the pipe, and in Germany a marked increase in consumption had taken place. In England an imperial economic committee, which had been making a survey of the situation, estimates that pipe tobacco did not form more than 35 per cent of the total tobacco consumption of the British Empire. In India the annual consumption of cigarettes was about six and one-half billion, as compared with less than one billion before the War.

Exports of American tobacco were expected to exceed 500,000,000 pounds in 1928, the largest amount for any year since 1924. The exports of flue-cured tobacco increased 14 per cent in 1928 over those of the preceding year. The United Kingdom and China were the leading markets for this type of tobacco; and the exports of cigarettes to China increased. The export of American flue-cured tobacco was also favored by the increased use of cigarettes and the limited foreign production of similar tobacco. Canada exported to Great Britain nearly 7,000,000 pounds of tobacco, compared with about 175,000 pounds in 1921.

For tobacco-plant diseases, see BOTANY, under *Plant Diseases*.

TOBAGO. A West Indian island, included administratively in Trinidad. See TRINIDAD.

TOGO, tō'gō, or TOGOLAND. A former German

protectorate in West Africa; after the War, divided between Great Britain and France; situated between Dahomey and the Gold Coast. Total area, 33,700 square miles; total population estimated at 762,208, of whom 245 were Europeans. Hamitic tribes make up the population of the north, while in the south the chief stock is the Ewe. To France has been allotted about two-thirds of the total area; namely, 21,200 square miles, including all the coast. The British part bordering the Gold Coast has an area of 12,600 square miles, with a population, according to the census of 1921, of 188,265. The soil is generally fertile and the forests are extensive; the mineral resources are rich but undeveloped. Iron is reported to be especially abundant. Statistics for exports, imports, revenue, and expenditure are now included in the general totals of the Gold Coast. The Governor of the Gold Coast is the administrator of the territory.

In French Togo, the natives engage in agriculture and some manufacturing. The chief agricultural products are corn, yams, plantains, peanuts, etc. The forest products are of some value, but the chief trade is in palm oil, palm kernels, cacao, copra, cotton, and rubber. The native industries include weaving, straw plaiting, wood cutting, pottery, etc. In certain districts the natives engage in iron smelting. In 1926 the imports were valued at 99,047,677 francs; exports, 70,374,154 francs. The budget for 1927 balanced at 33,585,000 francs. From Lome, the seat of the Government, there are railway connections with Anecho, Palime, and Atakpame, with a total length of 204 miles. In 1926, 357 vessels cleared from the two ports of Lome and Anecho.

TOLEDO, OHIO. See MUNICIPAL GOVERNMENT.

TOLEDO, UNIVERSITY OF THE CITY OF. An institution of higher education at Toledo, Ohio, founded in 1872. The enrollment for the autumn of 1928 totaled 2034, including 995 day students, and 1039 late afternoon and evening students. There were 256 students registered for the summer session. The faculty had 84 members. The annual budget of the university amounted to \$250,470, and the library contained 21,000 volumes. At the election on November 6, 1928, a bond issue of \$2,850,000 was voted for the university, of which \$2,000,000 was to be used for buildings, \$500,000 for equipment, and \$350,000 for new location. It was planned that the university would occupy its new building by the autumn term of 1930. President, Henry John Doermann, A.M., Ed.D.

TOLL BRIDGES. See BRIDGES.

TOLSTOY, LEO, ANNIVERSARY. See CELEBRATIONS.

TONGA or FRIENDLY ISLANDS. Three groups of islands, together with small, outlying islands, to the east of Fiji in the Pacific Ocean, between 15° and 23° 30' S. latitude and 173° and 177° W. Longitude: since May 19, 1900, a protectorate of Great Britain. Total area, approximately 385 square miles; population, according to the census of 1921, 23,759 Tongans; 370 other Pacific islanders; 571 Europeans; and 235 half-castes. Estimated population in 1926, 27,048. The natives are Christians, about 16,000 belonging to the Free Church of Tonga. At the end of 1926 there were 111 public primary schools, with 4529 pupils enrolled. Tonga College had eight teachers and 170 students at

the end of 1926. Native produce consists almost entirely of copra. Revenue in 1925-26, £91,696; expenditure £68,759. In 1926 the imports were £227,882 and the exports £255,156. The Government is under the High Commissioner of the Western Pacific, who acts by the advice of the local ruler and native chiefs. Queen in 1928, Salote, who succeeded Apr. 12, 1918; High Commissioner for the Western Pacific, Sir Eyre Hutson.

TONGKING, tōn'ken. A French protectorate, constituting the northern chief division of the colony of French Indo-China, south of the Chinese provinces of Kwangsi and Yunnan. Area, 40,530 square miles; population in 1926, 7,401,912, of whom 9143 were Europeans, exclusive of military forces. The chief city is Hanoi, which is the capital of French Indo-China, with a population of 103,235 in 1926. The chief crop is rice, although there is also a large annual production of raw silk. The mineral resources include limestone quarries, calamine and tin mines, as well as rich anthracite coal beds. Among the principal imports are metal tools and machinery, yarns, and cotton. The chief exports are rice, corn, and animal products. Imports in 1926, 1,700,758,000 francs; exports 1,316,401,000 francs. The local budget for 1927 balanced at 18,017,180 piastres. The Government is under a resident superior, who in turn is under the Government-General of French Indo-China.

TORNADOES. See METEOROLOGY.

TORONTO, UNIVERSITY OF. An institution of higher education at Toronto, Canada, founded in 1827 and supported by the provincial government. The 1928 autumn enrollment was 5961, distributed as follows: Arts, 3124; medicine, 748; applied science and engineering, 599; household science, 169; education, 291; forestry, 66; music, 26; graduate students, 371; dentistry, 251; social service, 85; public health nursing, 226; occupational therapy, 54; graduate nurses, 21. The faculty numbered 659. The total expenditure for the year 1927-28 for salaries and maintenance was \$2,396,212. The library contained 220,349 volumes and 76,876 pamphlets. Among the gifts received during the year was a grant of \$250,000 from the Rockefeller Foundation for the school of hygiene; and other smaller contributions which brought the total gifts received to \$337,915. At a special convocation held on November 7, the University of Toronto conferred on Sir Austen Chamberlain, Secretary of State for Foreign Affairs in the British Government, the honorary degree of doctor of laws; and upon Paul Claudel, French Ambassador to the United States, the honorary degree of doctor of letters. President, Sir Robert A. Falconer, K.C.M.G., D.Litt., LL.D., D.D., D.C.L.

TORPEDO BOAT. See NAVAL PROGRESS.

TORREY, REUBEN AROHER. American clergyman and evangelist, died at Asheville, N. C., October 25. Born at Hoboken, N. J., Jan. 28, 1856, he was graduated from Yale in 1875, and from the Yale theological seminary in 1878, in which year he was ordained into the Congregational ministry. After serving as minister of a church at Garrettsville, Ohio, he studied theology at Leipzig and Erlangen, 1882-83. On his return to the United States, he was assigned to a church at Minneapolis, where, having become superintendent of the city missions, he later

organized an independent People's Church. Becoming associated with Dwight L. Moody, the evangelist, Mr. Torrey served as superintendent of the Moody Bible Institute, 1889-1908, and after accompanying Mr. Moody to his revival meetings throughout the country, he later preached independently, making many converts. He preached in Europe, Australia, and the Orient, 1902-03, and in England, 1903-05. He traveled continually, revisiting Europe and the Far East and holding religious meetings in the United States and Canada. Besides his evangelistic work, Mr. Torrey served as Dean of the Bible Institute of Los Angeles, 1912-24, and as pastor of the Church of the Open Door, of that city, 1915-24. He became a special lecturer at the Moody Bible Institute of Chicago in 1927. He wrote more than fifty religious and evangelistic books, in the interest of general morals and explaining the Bible, many of which were translated into several languages.

TOWNE, CHARLES ARNETTE. American lawyer and former member of Congress, died at Tucson, Ariz., October 22. Born in Oakland County, Mich., Nov. 21, 1858, he attended the University of Michigan and was admitted to the Michigan bar in 1886. Moving to Duluth, Minn., in 1890, he was elected as a Republican to the United States House of Representatives, serving 1895-97. Being ardently in favor of bimetalism, he left the Republican party in 1896, advocating the election of W. S. Bryan and acted as national chairman of the Silver Republican party, 1897-1901. He was the unsuccessful Fusion candidate for the United States Senate in 1899. Both the People's party and the Silver Republican party nominated him for vice president in the national election of 1900, but he refused to accept either candidacy. Governor Lind appointed him to the United States Senate on December 5 of that year, where he served until Jan. 28, 1901, filling the vacancy caused by the death of C. K. Davis. His interest in the Texas oil industry brought him to New York City, where he engaged in the practice of law, and he was elected to Congress as a Democrat in 1904, serving 1905-07. He was on a speaking tour for the Democratic party in the national campaign of 1928 at the time of his death.

TOWN PLANNING. See CITY PLANNING.

TRACHOMA, trā-kō'mā. More as a medical curiosity than for any scientific worth is the information that workmen who have developed trachoma have made claims for accident insurance under the impression that the malady had been due to the entrance of sand, dust, etc. into the eyes. There is a certain parallelism between the disease trachoma and the effects of severe or persistent mechanical irritation of the eyes; so that at times it is difficult to make a distinction. To complicate matters, it is known that simulators have produced an artificial imitation of trachoma. Among soldiers it has been well known that the application of powdered ipecac or emetin is able to produce a trachoma-like affection which can deceive the military surgeon. Dr. Steiner, a Swiss who had spent years in Java and was sufficiently familiar with trachoma, admits in the *Schweizerische medicinische Wochenschrift* for November 3, 1928, that the borderline between this disease and actual mechanical injury or irritation is puzzling. Injury or irritation may of course

complicate active trachoma or healed cases may be reactivated. Workers who have made claims thus far have been mostly masons. Ordinary granulosis, the granulated eyes of the laity, is often a complicating feature. It is conceivable that in few conditions is expert treatment more in request or more difficult.

TRACK AND FIELD ATHLETICS. See ATHLETICS.

TRACY, trā'si, JAMES MADISON. An American organist, died in Denver, Colo., September 3. Born at Bath, N. H., Jan. 27, 1837; he studied with Carl Hauser in Boston, entered the Leipzig Conservatory in 1858, and in 1860-61 completed his musical education under Liszt in Weimar. From 1868-84 he resided in Boston, teaching at the Boston Music School. After that he taught in several institutions in various cities until 1900, when he settled permanently in Denver, where he established the Liszt School of Music, of which he was director till shortly before his death. He was the author of *Theory and Rudimental Harmony* (1878) and wrote several technical and instructive works for the piano.

TRACY, LOUIS. English author and journalist, died near Ashford, Kent, August 13. He was born at Liverpool, March 18, 1863, and was educated at private schools in Yorkshire and in France. He started journalistic work on the *Northern Echo*, at Darlington, in 1884, and two years later he moved to Cardiff. In 1889 he went to Allahabad, India, and remained there until 1893, when, returning to England, he bought a share in the *Evening News*. In 1895 he went to the United States, traveling extensively in America, and visiting India, until 1900. During the World War he wrote and lectured on international affairs, particularly in the United States. He also served in the Whitty District North Riding Regiment of Volunteers, becoming a sub-commander in October, 1915, and he became a member of the headquarters staff of the British War Mission in the United States on Sept. 13, 1917. He was associated with the British Foreign Office for a short time in July, 1919, and two years later he came to the United States to collect funds for the restoration of Westminster Abbey. He was, at that time, on the editorial staffs of the *Times* and the *Daily Mail*. In 1920 he was created a commander of the Order of the British Empire. In addition to his journalistic activities, he wrote many novels and stories, including: *The Final War* (1896); *Rainbow Island* (1904); *The Pillar of Light* (1905); *The Wheel o' Fortune* (1907); *The Red Year* (1908); *The Stowaway* (1910); *The Silent House* (1911); *The Only Way*. (1913); *Diana of the Moors* (1914); *His Unknown Wife* (1915); *The Day of Wrath* (1916); *The Postmaster's Daughter* (1917); *The Park Lane Mystery* (1923); *The Turning Point* (1924); *The Passing of Charles Lanson* (1925); *The Black Cat* (1925); *The Cleave Mystery* (1925); *The Law of the Talon* (1926); *The Third Miracle* (1927), and *The Woman in the Case* (1927).

TRADE FAIRS. See EXPOSITIONS.

TRADE-UNIONISM. It is a familiar enough fact to close students of labor history that the establishment of powerful unions in certain industries has advanced rather than retarded industrial progress. It is no idle boast that one reads in the following statement of Sidney Hillman, president of the Amalgamated Clothing

Workers' of America: "The labor cost in our industry has gone up much less than that in any other industry. By working out our problems with the employers, we have produced efficient methods of work. . . . I can say that there is no important change in the manufacturing process in the shop for which the union is not at least 50 per cent responsible." The *Monthly*

hood of Railway Carmen of America, the United Brotherhood of Carpenters and Joiners, all of which had more than 10,000 members.

JAPAN. For the year 1927 the Japanese Bureau of Social Affairs reported a total membership of 309,493 trade-unionists in 505 unions. The accompanying table gives the membership in these unions by industries and sex.

NUMBER AND MEMBERSHIP OF TRADE UNIONS IN JAPAN AT END OF 1927

Industrial group	Number of unions	Membership		Total
		Male	Female	
Machine and tools.....	72	96,188	994	97,182
Chemical	57	7,904	1,208	9,112
Textile	19	7,695	7,857	15,552
Food and drink	13	4,580	699	5,279
Miscellaneous	86	14,260	801	15,061
Mining	11	11,196	2	11,198
Gas and electricity	10	8,819	6	8,825
Transport	61	115,477	709	116,186
Communications	1	871	871
Civil engineering and construction	26	1,560	2,560
Others	149	26,919	748	27,667
Total	505	296,469	13,024	309,493

Labor Review has collected some curious examples of the extent to which the union's co-operation with the employers of its members is willing to go. When a contracting firm was threatening to go out of business because it could not meet the low prices being set by the manufacturer, the union stepped in, brought the disputants together, succeeded in having the manufacturer raise his prices and thus kept the shop open. In another case, where 3000 workers were involved, a firm of manufacturers was about to close its shops because of inefficiencies in management and too keen competition. The union made an investigation, recommended the needed adjustments, and saved the workers their jobs though the conditions were for the time being disadvantageous to them. The union has even gone so far as to offer loans to employers who were being threatened with liquidation. In three such cases where the union offered its aid, the number of employees was 1000 persons or more in each instance. One firm did not avail itself of the offers of the union's credit, one did and paid off the loan in a few months, while the third accepted the union's offer and was still paying off the money advanced. The two firms that were saved by the union later employed between them 4000 union members.

CANADA. For the year 1927 there were 2604 branches of labor organizations in Canada with a total membership of 290,282. Of this total, 140,195 persons were affiliated with the Trades and Labor Congress of Canada and 46,279 persons were affiliated with the All-Canadian Congress of Labor. International craft unions accounted for 180,755 of the 1927 membership, the One Big Union, for 19,245 members, the Industrial Workers of the World, for 4400 members, the Canadian Central Labor Organizations, for 48,435 members, independent units for 12,447 members, and the national and Catholic unions, for 25,000 members. The total gain in membership over the previous year had been 15,678 persons and all the units but the I. W. W. had gained. There were 85 international craft unions in the country, the more important being the United Mine Workers of America, the International Association of Machinists, the Brotherhood of Railroad Trainmen, the Brother-

hood of Railway Carmen of America, the United Brotherhood of Carpenters and Joiners, all of which had more than 10,000 members.

GREAT BRITAIN. The following figures for trade-union membership in Great Britain and Northern Ireland were compiled by the Ministry of Labor and include all unions made up of skilled, unskilled, professional, and clerical workers. It will be noticed that the peak year was 1920 and that the years following witnessed a continuous decline. It will be observed, however, that the 1926 membership of 5,208,000 was 25 per cent greater than 1913's figure. The report points out that the decreases occurred in the following industries: mining and quarrying, 126,000; road transport and dock workers, 40,000; railway workers, 40,000; metal trades, 20,000.

MEMBERSHIP OF TRADE-UNIONS IN GREAT BRITAIN AND NORTHERN IRELAND, AT END OF EACH YEAR, 1913 TO 1926

Year	Membership	Year	Membership
1913	4,135,000	1920	8,337,000
1914	4,145,000	1921	6,621,000
1915	4,359,000	1922	5,616,000
1916	4,644,000	1923	5,413,000
1917	5,499,000	1924	5,534,000
1918	6,533,000	1925	5,497,000
1919	7,926,000	1926	5,208,000

BRITISH TRADES-UNION CONGRESS. The 1928 congress, which was held at Swansea the week of September 3, showed a continued swing to the right and a desire to part company with the point of view expressed by Mr. Cook that trade-union action might be used as a revolutionary lever. The upshot of the congress appeared to be that trade-unionism was going to "use its power to promote and guide the scientific reorganization of industry as well as to obtain material advantages from that reorganization." It was reported that the aggregate membership of the affiliated unions was 3,874,800, a decline from 1927 of 289,000. With the expulsion of the National Union of Seamen, which the Congress proceeded to do, there was another loss of 60,000 members. The congress was marked by disorders in which the Communist elements participated.

TRANSJORDANIA. A territory of Asia

Minor inhabited by Arabs, of which the territorial and political status was still unsettled in 1928, although nominally under the mandate of Palestine; situated to the east of the Jordan and north of the Arab dominions of the Hedjaz and Nejd. The area is uncertain because of the unsettled boundaries; the population has been estimated at 260,000, of whom 220,000 are Arab Moslems. About half the population are nomads, the rest living in villages. A large part of the territory is desert. In the arable regions the principal pursuits are agriculture and stock raising. The estimated revenue for 1927-28 was £227,000 and the grant-in-aid from the British Government £68,000. In 1923 the British Government recognized the local Arab rule on condition that it should conform to constitutional principles and receive the approval of the League of Nations. Up to 1928 this approval had not been obtained. The general responsibility for Transjordan rests with the High Commissioner for Palestine, who is represented in the country by an agent. The Emir in 1928 was Abdullah Ibn Hussein.

TREPOV, tráp'póf, PRINCE ALEXANDER FEODOROVITCH. Former premier of Russia, died suddenly at Nice, France, November 10, at the age of sixty-six. He served in the army when a young man, resigning to enter the Ministry of the Interior. Being interested in rural education, he became associated with the Zemstvo of Pereyaslav, and represented that organization at the Zemstvo of Poltava. He undertook a position in the State Chancellery in 1897 and was appointed assistant secretary to the Imperial Council two years later. When Czar Nicholas II was compelled to grant representation to the people in the form of the "Gosudarstvennaia Duma," 1906, Prince Alexander was selected to aid in the establishment of the new council. After having been sent to western Europe by the Czar in 1907, to study parliamentary systems, he was appointed senator in the same year. He was made a member of the Imperial Council in 1914, and although he joined the reactionary group, he did not actively support imperialistic measures. As minister of communications, in 1915, Prince Alexander reorganized the railroad system, and instituted an extensive building programme. He was made premier in November, 1916, to succeed Boris Stürmer, and continued his reactionary policies. During Prince Alexander's repressive ministry, the war forces were ineffectually directed, and popular discontent increased rapidly. He resigned on Jan. 9, 1917, and was replaced by Prince N. Golitzin. After the Revolution of 1918, Prince Alexander worked for the restoration of the monarchy.

TREVELYAN, tre-vél'yan, SIR GEORGE OTTO. English statesman and historian, died at Wallington, Northumberland, August 17. He was born at Rothley Temple, Leicestershire, July

20, 1838, the nephew of Lord Macaulay, and was graduated with honors from Harrow in 1857, and from Trinity College, Cambridge, in 1861. He then joined the East Indian Civil Service, under his father, Sir Charles Edward Trevelyan, who was at that time Governor of Madras. On his return to England he was elected as a Liberal to the House of Commons from Tynemouth in 1865, being reelected from the Hawick Burghs in the Liberal victory of 1868, when Gladstone succeeded Disraeli as Prime Minister. Trevelyan was appointed Civil Lord of the Admiralty in the same year. During his long service in Parliament he was an influential speaker, leading in the abolition of purchase in the Army and in the extension of household suffrage.

Sir George resigned his post on the Admiralty in 1870, because he disagreed with Gladstone on the Education Bill, but he retained his place in Parliament when the Liberal party was defeated four years later, serving continuously from the Hawick Burghs until 1887, and from the Bridgeton Division of Glasgow for the following ten years. On Gladstone's return to office in 1880, he appointed Trevelyan Secretary of the Admiralty, and two years later sent him for an arduous year to Ireland, as Chief Secretary of the Lord Lieutenant, taking the place of Lord Frederick Cavendish, who had been assassinated.

Soon after Trevelyan's return to England, he was made Chancellor of the Duchy of Lancaster in 1884, and given a place in the cabinet. Gladstone, regaining the premiership in February, 1886, after his defeat by Lord Salisbury the previous year, appointed Trevelyan Secretary for Scotland, but the latter resigned shortly afterward, being among those Liberals who opposed the separate Irish Parliament provided for in the Home Rule Bill. After Gladstone's third defeat, and his return to the ministry in 1892, he again placed Trevelyan in his cabinet, and appointed him Secretary for Scotland, a position which he held through Lord Rosebury's leadership, 1894-95. He retired from public life during Lord Salisbury's government, in 1897.

As a historian, Trevelyan made for himself a reputation even more lasting than that achieved in public life. He wrote several notable biographies and histories, the first being, *Life and Letters of Lord Macaulay* (1876), which ranks with the best English biographies. His next book, *The Early History of Charles James Fox* (1880) achieved a well-deserved and permanent popularity through its lively presentation of eighteenth-century society. While preparing a second book on Fox, Trevelyan became absorbed in the American War of Independence and wrote a four-volume history, *The American Revolution* (1909), considered, both in England and America, as one of the most comprehensive extant studies of the effect of the Revolution on England, Europe, and America. He completed the series with *George the III and Charles Fox*, two volumes (1912-14). His less important books are fiction and include: *The Ladies in Parliament*, and *Horace at the University of Athens*, which he wrote while still at Cambridge, and *The Competition Wallah* (1864); and *Cannepore* (1865).

TRICKETT, WILLIAM. American educator, died at Carlisle, Pa., August 1. He was born at Leicester, England, Jan. 9, 1840, and was taken

to the United States when he was an infant. He was graduated from a Philadelphia, Pa., high school and became connected with the Philadelphia Methodist Episcopal Conference. He preached in Pennsylvania, Maryland, and Delaware, but turned from the pulpit for an academic career. He studied at Dickinson College, graduating in 1868. He was admitted to the Pennsylvania bar in 1876. He was principal of the Dickinson, Pa., grammar school, 1868-69; then from 1869 until his death he was connected with Dickinson College, first as adjunct professor of philosophy (1869-71), then as professor of modern languages (1874-75) and finally, from 1890, as professor of law and dean of the law school, which he organized. De Pauw University conferred on him the degree of LL.D. in 1890. Dr. Trickett was an acknowledged authority on the property law of Pennsylvania, and wrote several books on the subject, as well as others on different branches of the law.

TRIESTE, trĕ-ĕst. A former crownland of Austria; occupied by Italy after the War, and retained by Italy under the peace settlement; including the port of Trieste and surrounding regions. Area, 37 square miles; population, at the census of Dec. 1, 1921, 238,655; estimated Jan. 1, 1926, 242,059.

TRINIDAD. A West Indian island north of the mouth of the Orinoco River, constituting, with Tobago, a British colony. Area of Trinidad, 1862 square miles; of Tobago, 114; total population, according to the census of 1921, 365,913; estimated at the end of 1926, 387,470. Capital, Port of Spain, with a population in 1926 of 65,016. The white population is chiefly made up of French, British, Spanish, and Portuguese, while the majority of the natives are West Indians of African descent. East Indians in 1926 were estimated at 126,175. English is the prevailing language. In 1926 the movement of population was: Births, 12,349; deaths, 8496; marriages, 1651. In the same year there were 289 elementary schools, with an enrollment of 57,983 pupils. About 312,355 acres were under cultivation in 1926. A celebrated feature is the asphalt lake, the revenue from which in 1926 was \$88,303. The petroleum industry is of prime importance, the output in 1927 being 5,380,464 barrels of crude oil. There are a number of refineries and other plants for the manufacture of oil fuel, kerosene, etc. The imports in 1926 were valued at \$4,407,074; exports, \$5,546,376; revenue, \$1,737,288; expenditure, \$1,580,213; public debt, \$3,342,056. The total shipping which entered and cleared in 1926 was 3955 vessels of 4,933,553 tons. The colony of Trinidad is under a governor who is aided by an executive council and a legislative council. Governor in 1928, Sir Horace Archer Byatt.

TRINITY COLLEGE. An institution for the higher education of men, at Hartford, Conn.; founded by members of the Protestant Episcopal Church in 1823, as Washington College, and changed to Trinity College in 1825. For the autumn term of 1928, the enrollment was 276, distributed as follows: Graduate students, 10; seniors, 45; juniors, 56; sophomores, 75; freshmen, 83; non-matriculants, 7. There were 34 members on the faculty. The endowment fund of the college amounted to \$3,070,385, and the income totaled \$253,625, exclusive of \$183,919, received in gifts during the year. There were

approximately 100,000 volumes and 40,000 pamphlets in the library. President, Remsen B. Ogilby, Litt.D., LL.D.

TRINITY COLLEGE OF DUKE UNIVERSITY. See DUKE UNIVERSITY.

TRIPOLITANIA. An Italian territory on the north coast of Africa; until 1919 a part of Italian Libya. In that year, for administrative purposes, Libya was divided into Tripolitania and Cyrenaica. Area, estimated at 900,000 square miles; population, according to the census of 1921, about 550,000 natives, and 20,716 Europeans, of whom 18,093 were Italians. The land is rather barren, but supports some palm, lemon, olive, and fig trees. The sponge fishing industry along the coast is of great importance. In 1926 production totaled 109,450 pounds, valued at 5,472,000 lire. The imports in 1926 were 211,217,533 lire; exports, 45,246,772 lire; colonial revenue for 1927-28, 217,374,250 lire; civil expenditure, 53,420,000 lire; military expenditure, 163,954,250 lire, revenue and expenditure, 1928-29, 223,719,250. The chief means of transportation is along caravan routes to the interior. There are also about 117 miles of railway. Tripoli, with a population of approximately 60,000, is the capital. Governor in 1928, General Emilio de Bono. See CYRENAICA.

TUBER/CULO'SIS. THE CALMETTE SERUM.

The Hygienic Section of the League of Nations met at Paris, October 15-18, to pronounce an opinion on the value of Calmette's method of immunization of infants against developing tuberculosis in later life. Roux, the successor of Pasteur and Metchnikoff as director of the Pasteur Institute, presided. The section was subdivided into bacteriological, clinical, and veterinary subsections. Thirty experts in various lines made up the conference. In Germany the method of immunization had not yet been tested on human subjects, but in France and the other Latin countries it had been tested in at least 150,000 infants, although for the most part the period was too recent for formal conclusion. To cite a single example, Dr. Bravo y Friar, head of the Madrid Foundling Asylum, submitted 385 infants to the Calmette immunization, while 880 others were not treated. The mortality in this institution is always high—about 36 per cent. It can only be said that the vaccinated group showed a higher death rate than the unvaccinated, but the deaths from tuberculosis were somewhat fewer in the immunized—1.1 per cent as against 3.8 per cent. Tests evidently are unsuitable in foundling asylums, because few deaths occur from tuberculosis at best in these institutions, and the large number of premature births is responsible in part for the heavy mortality. Many diseases contribute to the death rate and tuberculosis has little chance to vie with the more acute affections. Calmette objected that the reports sent in from various sources were incomplete, and gave no material for a statistical basis. It must be confessed, however, that Calmette himself not being a professional statisti-

cian, his own figures and conclusions may be open to criticism. There should be an adequate way of connecting the degree of exposure to the disease with other figures and two groups should be made of those who have and have not been exposed to open tuberculosis among their elders.

Much better support of Calmette's immunization came from Oslo, Norway, where not infants but young schoolgirls were the subjects. In the absence of exact details, it appears that the immunized subjects reacted negatively to tests with tuberculin and did not develop any victims of the disease; while many of the same age periods who were not vaccinated developed active tuberculosis.

Evidence from the veterinarians present was unanimous that the Calmette product had decided immunizing properties, although the reporter did not give any figures. The reporter in question was Dr. Schlossmann, of Düsseldorf, who covered the conference for the *Deutsche medizinische Wochenschrift* (Nov. 9, 1928). His summary of the results of the meeting are in part as follows:

First, the vaccine, known familiarly, for short as BCG, is harmless, wide experience with both mankind and animals having made this obvious. Therefore there need be no scruples against its general use, although for the present this should probably be restricted to groups which have been living in a tuberculous medium. Second, as to the degree of protection given, favorable reports from all veterinarians who have employed it cannot be straightway applied to mankind, and Dr. Schlossmann is none too sanguine about the prevention of human tuberculosis. He reaches this conclusion largely, it seems, from experiments carried out by himself on apes, but as these experiments are still in progress and need to be carried out on a larger scale than heretofore, he will for the present hold his opinion in reserve. In any case he is far from saying that Calmette's long years of work have been wasted, for it may be shown that he has advanced our knowledge along several lines. For example, he seems to have shown that the dreaded aerial transmission of tuberculosis is a myth. Calmette again must be thought of as one of the most distinguished disciples and successors of Robert Koch. The conference was to meet again and much may transpire in the meaning. See also CHEMISTRY, under *Biological Chemistry*.

TUBERCULOSIS, ANIMAL. See VETERINARY MEDICINE.

TUFTS COLLEGE. A non-sectarian institution for the higher education of men and women at Medford, Mass., founded in 1852. It comprises the school of liberal arts, Jackson College (the department for women); the engineering school; the school of religion on the Crane Foundation; and the medical and dental schools. The registration for the autumn term of 1928 was 2037. For the year 1927-28 there were 407 members on the faculty. The productive funds of the college amounted to \$7,913,501, and the income for the year to \$853,092. The library contained 93,000 volumes. President, John Albert Cousens, LL.D.

TULANE UNIVERSITY OF LOUISIANA, THE. An institution of higher education, located at New Orleans, founded in 1834. Although the professional schools are coeducational, there is

a separate undergraduate department for women. The total enrollment for the autumn term of 1928 was 2836, excluding all duplications, and was distributed as follows: Arts and sciences, 450; engineering, 277; H. Sophie Newcomb College, 626; graduate, 120; law, 97; medicine, 436; graduate medicine, 43; pharmacy, 23; commerce and business administration, 525; courses for teachers, 224; social work, 15. There were 1133 enrolled in the 1928 summer session. The faculty numbered 412 members. The productive funds of the university for the fiscal year ending August 31, 1928, amounted to \$8,982,001; the income for the year to \$1,249,115; and gifts and bequests totaled \$1,623,647. The library contained 132,945 volumes. During the year a new building for the college of law was erected, greatly increasing the facilities of that department, and a dormitory for women was also constructed. A four-year course in physical education for men and a special course in parasitology were established; the work in psychology and sociology was expanded; a further development took place in full-time instruction in the school of medicine; additions were made to the faculty of the college of law; and the university sent its fourth scientific expedition from the department of Middle American research into Central America. President, Albert Bledsoe Dinwiddie, Ph.D., LL.D.

TULAREMIA. Much was being learned as to the incidence of this relatively new disease not only in mankind but in many species of wild life, including food animals. In a brief editorial summary in the *Journal of the American Medical Association* for May 26, 1928, it was pointed out that the Minnesota State Board of Health had reported a diminution in the number of wild rabbits and of partridges during the past four years coincident with the appearance of human victims. The rabbits which remain show the presence of specific agglutinins in the blood, indicating a successful resistance to the microorganism which causes the disease. The discovery of the rabbit tick upon the partridge may explain how game birds may become infected from the quadruped. In the laboratory both rabbit and bird succumb readily to artificial inoculation with the *Bacterium tularense*. Thus far, no case in man has been traced to cleaning the partridges, but the number of these which are sold for food is far smaller than that of the rabbit. In California, the ground squirrel and meadow mouse are among the animals to contract the disease, possibly through the intermediation of mites.

TUNIS. A French protectorate in North Africa, known as the Regency of Tunis, situated on the Mediterranean coast east of Algeria, bounded on the south by the Sahara and Libyan deserts. The area is estimated at 48,300 square miles. According to the census of 1926, the total European population was 173,281, composed of 71,020 civilian French, 89,216 Italians 8396 Maltese, 517 Spaniards, 646 Greeks, and 3486 other foreigners. The total native population was 1,986,427, of whom 1,932,184 were Arabs and Bedouins, and 54,243 Jews. The capital is the City of Tunis, with a population in 1926 of 185,996; other towns are Sfax, 27,723, and Bizerta, 20,593. In 1927 there were 434 public schools, including 8 lycées and colleges, and 32 private schools, of which six were Jewish schools provided by the Government. The total number

of pupils in the schools was 64,568. There are, besides, numerous Mohammedan schools, some of which are assisted by the state.

The chief industry is agriculture and the principal crops are wheat, barley, and oats. The soil is well adapted to fruit culture, and in the South dates are especially abundant. Olive trees abound in many parts of the country. The area under wheat in 1926 was 1,861,670 acres, the production 355,000 tons; barley, 1,420,752 acres, 192,000 tons; oats, 96,227 acres, 31,000 tons. There were 16,181,744 olive trees, which produce about 40,000 tons of oil annually. There were 2,138,000 date palms, of which 1,034,892 produced 1,000,000 pounds of dates. The livestock consisted of 86,851 horses, 154,175 asses, 36,800 mules, 467,588 cattle, 2,171,970 sheep, 1,582,443 goats, 153,162 camels, and 23,568 pigs. Among the native industries are spinning and weaving, pottery making, saddle making, etc. The mineral resources include lead, zinc, and iron ore and especially phosphates.

Advance figures of Tunisia's foreign trade during 1927 showed total imports valued at 1,772,000,000 francs (\$69,550,000), marking a 30 per cent gain in francs and a 60 per cent gain in dollar value. Exports valued at 1,027,000,000 francs (\$40,310,000), declined 14 per cent in nominal value, and about 4 per cent on a dollar basis. The much heavier adverse visible trade balance is only slightly offset by tourist trade and other invisible items. France maintained its leadership in the Tunisian market, supplying 56 per cent of the imports by value and taking 37 per cent of the exports. Products from the United States valued at 81,869,000 francs (\$3,213,000) comprised mainly machinery and parts, kerosene and gasoline. The United States purchased goods valued at 19,768,000 francs (\$776,000), chiefly olive oil and iron ore.

The revenue for 1927 was 388,050,521 francs and the expenditure 388,000,566 francs. In 1926, 9423 vessels entered the ports of Tunis; in the same year there were 1258 miles of railway, of which 315 miles were broad gauge. The Bey of Tunis in 1928 was Sidi Mohamed, who succeeded July 10, 1922. The Government, known as the Regency of Tunis, is under the French Foreign Office, which is represented by a Resident-General. The administration is a mixture of French and native institutions. Resident-General in 1928, Lucien Saint (appointed Nov. 24, 1920).

TUNNELS. The year was marked by the completion in record time of the greatest railroad tunnel of the Western Hemisphere, the Cascade Tunnel on the Great Northern Railroad; by the opening of the Oakland Vehicular Tunnel in California, and by the start of the Detroit Tunnel. Apparently, the "pioneer tunnel" method had become the standard plan for long rock tunnels. In subaqueous tunneling, the trench system and the shield method had been so standardized as to make subaqueous work, even of large diameter, primarily a matter of engineering economics rather than a problem involving great and unprecedented problems of design and construction. In short, with modern methods it was becoming clearer that cost and market were the only limits to size, and that, as increased possibilities of traffic promise a satisfactory return on invested capital, even greater works will be undertaken.

THE CASCADE TUNNEL. The official opening of this tunnel, set for January 12, 1929, was

awaited with particular interest both because it is the longest railroad tunnel of the Western Hemisphere and because its opening was to be coincident with the change from steam to electricity in the operation of the mountain portion of the Great Northern Railroad. Back in the early nineties, John F. Stevens, the American railroad engineer who put the Panama Canal on its feet after earlier failures, discovered the Marias Pass and later built the first Cascade tunnel, 2.6 miles long, opened in 1900. This work made unnecessary a climb of 600 feet and a circuitous route of 12 miles to the "Stevens Pass," as the Marias Pass was renamed.

The new tunnel is 7.79 miles long and is only surpassed by the famous Alpine tunnels in Europe. It lowers the summit level of the railroad 502 feet, eliminates curves equivalent to over 10 complete circles, reduces the length of the maximum grade (2.2 per cent) by 18 miles, eliminates nearly 8 miles of snow sheds and actually reduces the length of track in tunnels and snow sheds combined by over 2 miles. The great reduction in the snow problem is one of its great benefits, for in this region one foot of snow in one hour is not an unusual rate and 100 feet on a level in a season is frequently exceeded.

The tunnel was built in the rapid time of three years which, compared with earlier works, showed clearly the advantages of modern methods and machinery. An intermediate shaft was sunk 622 feet to the tunnel grade about 2½ miles west of the east portal, thus giving four headings from which the work could go forward. A pioneer tunnel, 8 feet high and 9 feet wide, was also driven between this shaft and the west portal, about 50 or 60 feet to one side, with cross-cuts to the main tunnel. In this scheme, the main tunnel could be worked from the cross-cuts joining it with the pioneer tunnel. Furthermore, the pioneer tunnel served not only as a means of ingress and egress for the working force but also for the main compressed-air and other supply lines and for removing excavated material from advanced workings. It thus becomes the key to rapid construction and its additional cost was more than balanced in many cases by the fact that time was thus saved.

The Cascade Tunnel is a single-track section 18 feet wide and 24 feet high in rough rock excavation but reduced to 16 by 22 by the concrete lining. There were required 875,000 cubic yards of excavation, 264,000 cubic yards of concrete were placed; and the cost was about \$14,000,000. The original tunnel was electrified between 1908 and 1909, since which time there had been more extensive electrification on the Great Northern which was to include the new tunnel and a total of some 75 miles on the mountain division of this road.

NEW MUSCONETCONG TUNNEL. Traffic through this new 4840-foot double-track tunnel on the Lehigh Valley R. R. in western New Jersey was inaugurated November 26. It was built to relieve the old single-track tunnel nearby, which was completed in 1875 and which was considered a very remarkable work at that time. Consult *Railway Age* (New York) p. 441, Feb. 23, 1929.

MOFFAT TUNNEL. This work, described in previous YEAR BOOKS, was officially opened on February 26. It shortens the Moffat line between Denver and Craig, Colorado, the present terminal, by 23 miles, eliminates all 4 per cent grades,

and, should the 42-mile cut-off to the Denver and Rio Grande Western be built, would give a route between Denver and Salt Lake City 172 miles shorter than that now used.

GIBRALTAR TUNNEL. The New York *Times* announced, on December 16, that a commission of experts had been appointed to make a study for a tunnel to link Europe and Africa by rail under the Strait of Gibraltar. It was pointed out that such a construction would connect with the the French Sahara Railroad and make an all-rail-route to Cairo and ultimately a connection with the Cape-to-Cairo Railroad. The length under water was given at 8½ miles, but it was said that a depth of over 1000 feet was necessary which would require long approach tunnels in order to secure reasonable grades and might make the total length as much as 33 miles.

ZION PARK TUNNEL. A remarkable and spectacular tunnel was being built in Zion National Park, Utah, as part of a new road construction. The tunnel is 22 feet wide on a 5 per cent grade and is 5582 feet long. It starts at the north rim of the Grand Canyon of the Colorado and at intervals of 1100 feet or less, galleries are to be cut through to the face of the cliff, commanding views across the canyon and the valley 1000 to 1200 feet below. The surveys were particularly difficult and had to be made by triangulation from lower levels on the opposite side of the canyon.

THE OAKLAND ESTUARY TUBE. This subaqueous highway tunnel, of a larger diameter than any yet built, was opened to traffic in October, 1928. It is 3545 feet long between portals and two-thirds of this length consists of twelve precast segments, each 203 feet long, built in drydock, floated to the site, and sunk in position in a trench previously dug in the bottom of the estuary between Oakland and Alameda, California, which are connected by the tube. Work of dredging this trench, a cut as much as 50 feet deep below the estuary bottom, began in 1925 and piles were driven in part of the length to furnish support for the tubes. The sections were closed by temporary bulkheads and were successfully placed with their bottoms about 90 feet below water level. The section used for this tunnel is 37 feet outside diameter and provides a roadway 24 feet wide with two tracks, as it is to be used for both vehicular and electric-railway traffic. A ventilating system similar to that used in the Holland Tunnel in New York is provided.

DETROIT-WINDSOR TUNNEL. Contracts were let during the year for a vehicular tunnel between Detroit, Michigan, and Windsor, Ontario, the first international work of this kind ever built. It was to be a single tube slightly larger than those of the Holland Tunnel in New York but of considerably less length—5000 feet, portal to portal. Three types of construction were to be used. The river portion, 2500 feet, was to be built in sections 248 feet long and sunk in a trench excavated in the river bottom, a method which had been successfully used in the Oakland and earlier subaqueous constructions. The approaches were to be built partly by shield tunneling and partly in open cut.

An interesting and novel design was to be used for the river sections. The 248-foot units are to be built on shore, 21 feet diameter and made of an exterior welded in steel shell ¾ inch thick and lined with 18 inches of concrete. This shell is to be stiffened with flanged hoops at 12-foot in-

tervals and in wood forms. After sinking, concrete will be deposited around the tube and inside the forms, to a thickness of about 2 feet, by means of tremie tubes. Apparently, this vehicular tunnel, which was to be privately owned and operated and was estimated to cost \$10,000,000, would be in direct competition with the Detroit International Bridge now under construction.

TURKEY. A republic since Oct. 29, 1923; formerly the Ottoman Empire; occupying a portion of the Balkan peninsula—Turkey in Europe—and a large part of Asia Minor with contiguous territory—Turkey in Asia; since the Treaty of Lausanne, July 24, 1923, comprising in Asia Minor the territory lying within the Caucasian frontier, the northern part of the old Turco-Persian frontier, the frontier between Turkey and Syria extending from Jazira-ibn-Omar on the Tigris to a point near Payas on the Gulf of Alexandretta, and the so-called "Brussels" line between Turkey and Mesopotamia in Europe. Constantinople and eastern Thrace, according to boundaries fixed in the treaty; and, in the Mediterranean Sea, Imbros, Tenedos, and Rabbit Islands. Capital, Angora.

AREA AND POPULATION. The area of the present Republic of Turkey is estimated at approximately 494,538 square miles. For the first time in its history a general census was taken on Oct. 28, 1927, and showed the population to be 13,649,945. In Turkish returns published early in 1924, the population of the principal cities was given as follows: Constantinople, 880,998; Smyrna, 98,846; Konia, 71,104; Brussa, 64,664; and Adana, 64,110. The population of Angora is given as 75,000.

EDUCATION. Nominally, elementary education is compulsory for all children of both sexes. The schools are directly in charge of the Ministry of Education. The policy of the Republic has been to abolish religious schools of all kinds and replace them with government schools. Thus in 1924 the numerous Moslem schools were closed. The government schools comprise primary grades, secondary schools, training schools for teachers, and the University of Constantinople. No statistics were available during the year.

PRODUCTION. As Turkey is primarily an agricultural country, its economic condition is dependent on returns from this source. This dependence is reflected to some extent in the exports of tobacco, fruits, and vegetables, which normally constitute 50 per cent of the value of total exports. Although gradual progress has been made in increasing production of the leading crops, intermittent small yields, owing to adverse weather, have retarded any general recovery. Preliminary agricultural returns for 1927 indicated an improvement over 1926 for most crops. Tobacco production was estimated at 91,500,000 pounds against 84,000,000 pounds in 1926; cotton, 57,360,000 pounds in 1926-27 compared with 50,272,000 pounds in 1925-26; fig and raisin crops, 25,000 and 47,000 metric tons, respectively, for 1927, against 30,000 and 50,000 tons in 1926; filbert production, 15,000 metric tons against 5000; wool, 11,900,000 pounds, against 10,170,000 pounds; mohair clip, 3700 metric tons against 3100 tons. Data on the wheat production were not available, but unfav-

orable weather was thought to have caused a large decrease from the 1926 estimate of 4,700,000 metric tons. The 1927 olive-oil yield was estimated at 35,000,000 pounds. Livestock reports showed an increase over 1926 in sheep and goats, but a decrease in cattle and horses.

Although industry is relatively unimportant in Turkey, the trend of economic development is reflected, to some extent, in the slow recovery of the leading industries from the general disorganization which followed the exodus of the non-Moslem population, who predominated in this field. Rugs and textiles constitute the principal manufactures. The progress of the rug industry is indicated, to some degree, by the exports of this industry through the port of Smyrna in recent years. In 1927 they totaled 5,344,300 kilos, as compared with 4,709,000 kilos in 1926, and 3,996,000 kilos in 1925. These statistics include reexports from adjoining countries. Other small industries are flour milling, cement, brick, furniture, soap, etc.

COMMERCE. Foreign trade data for recent years show a preponderance of imports over exports. Statistics for 1926, the latest available, disclose a decrease in the value of exports and imports, as compared with the previous year, with a slightly smaller adverse trade. Exports and imports for 1926 were \$98,096,000 and \$122,574,000, respectively; similar figures for 1925 were \$105,134,000 and \$131,916,000. The accompanying table from the *Commerce Year Book* for 1928 gives the imports and exports for 1925 and 1926 by principal classes of commodities:

TURKISH IMPORTS AND EXPORTS BY PRINCIPAL CLASSES OF COMMODITIES (IN THOUSANDS OF DOLLARS)

Commodity	1925	1926
GENERAL IMPORTS		
Grain, legumes, and products	12,353	3,200
Sugar, coffee, tea, spices	11,358	10,516
Hides and skins, bristles, etc.	1,790	1,910
Leather and manufactures; furs ...	3,053	3,297
Cotton and manufactures	40,355	37,610
Flax, hemp, jute	3,780	2,998
Wool and manufactures	9,595	10,948
Silk and manufactures	2,543	2,663
Mineral oils, soap, candles	1,991	5,440
Metals	11,735	11,622
Machinery	4,205	5,303
Vehicles and vessels	2,997	3,453
Vegetable oils	4,607	1,961
Chemicals, drugs, dyes, medicines ..	3,179	2,715
GENERAL EXPORTS		
Meats, dairy products, fish	4,484	1,904
Grain, legumes, and products	3,087	3,235
Fruits and vegetables	20,479	18,124
Tobacco	33,200	35,316
Hides and skins, bristles, etc.	2,499	1,915
Leather and manufactures; furs ...	1,677	1,330
Cotton and manufactures	8,426	6,323
Wool and manufactures	6,287	8,390
Wood and manufactures	2,171	2,313
Seeds, plants, fodder	2,185	1,158
Metals and ores	2,045	2,589
Chemicals, drugs, dyes, medicines ..	6,435	6,135

FINANCE. Budget estimates for 1928-29 showed receipts at £T207,173,000 (\$105,451,000) against £T194,580,000 (\$99,042,000) budgeted for 1927-28. Increases were anticipated from monopolies, miscellaneous sources, and arrears. Larger expenditures were authorized for the public debt and Ministry of Public Works. In each of the two years the budget as voted was balanced. Receipts from monopolies furnish an important source of revenue; they embrace tobacco, salt, sugar, petrol, playing cards, alcohol, matches, posts, etc.; in 1928-29 estimated rev-

enues were £T58,040,000 (\$29,542,000). Expenditures on the reconstruction plan continued large; budget appropriations for the Ministry of Public Works in 1927-28 totaled £T25,723,000, in 1928-29, £T32,718,000. Preliminary budget estimates for 1929-30 disclosed revenues of £T220,291,300 and expenditures of £T220,297,000. The plan to retire the old paper currency, which went into effect on Nov. 1, 1927, was expected to be completed in six months.

COMMUNICATIONS. Lack of adequate transport system has to a large degree retarded the economic recovery of the country. Slow progress has been made in developing the roads urgently needed, but general extension of transport facilities has been handicapped by the limited financial resources. At the close of 1927 there were approximately 4500 kilometers of railway line in operation in the country, while contracts for construction of about 1500 kilometers of new railways were placed during the year by the Government. It was reported in the press late in the year that the Turkish Government had acquired the German-built Anatolian-Bagdad Railway through the completion of an agreement providing the payment of 50 per cent back interest and 4½ per cent interest on stock. It was stated that by the completion of this transaction all Turkish railroads had become State property. With a view to serving the northern section of the country, which is not readily accessible to the port of Constantinople, plans were under way for the construction of a harbor at Samsun. Although Turkey's coast line is extensive, its harbors are few and lack sufficient technical facilities and suitable connections with the interior. At present, Constantinople has the best harbor, from a natural, as well as an artificial, point of view, followed by Smyrna. The latter port, however, is the country's leading shipping point. A total of 2255 steam and sailing vessels of 1,775,059 tons called at Smyrna in 1927, as compared with 2227 vessels and 1,935,200 tons in 1926.

GOVERNMENT. As a result of the revision of the constitution in April, 1924, the Turkish state was declared to be a republic; the religion, Islam; the official language, Turkish; and the capital, Angora. The Assembly was to be elected every four years. While, according to Article 7, the Assembly exercises the executive power through the President elected by itself and through the council of ministers chosen by him, there is a proviso that the Assembly may at any time control the actions of the Government and at any time dismiss it. The President was to be chosen from among the deputies constituting the National Assembly, and his term of office was to be identical with the life of each Assembly. He is *ex officio* president of the Assembly and also, in case of necessity, of the council of ministers. He may, however, take no part in the debates of the Assembly, nor has he absolute power to veto legislation or to dissolve the Assembly. President in 1928, Mustafa Kemal Pasha. The cabinet was constituted as follows: President of the Council, Ismet Pasha; Interior, Shukri Kaya Bey; Finance, Sarrajoglu Shukri Bey; Public Works, Behij Bey; Foreign Affairs, Dr. Tewfik Rushdi Bey; Justice, Mahmud Essad Bey; Public Instruction, Nejati Bey; Public Health, Dr. Refik Bey; Agriculture and Commerce, Rahmi Bey; Defense and Marine, Mustafa Abdul Halik Bey.

HISTORY. The rule of Mustapha Kemel carried Turkey to new heights of industry and prosperity during the year. There were no signs of outward trouble and although from time to time there were reports in the press to the effect that Communists and plotters against the life of the President had been arrested and punished, the internal affairs of the Republic were likewise calm and unruffled. The westernizing movement went on apace, the most important change taking place during the year being the substitution of the Roman alphabet for the Arabic, which was decided by the President in August. A matter of passing interest to Americans was the trial and conviction of three members of the faculty of the American Schools for Girls at Brusa for the spreading of religious propaganda. They were accused of converting Moslems to Christianity, and were fined, but the fines meted out were extremely light.

October 29 was set aside to celebrate the fifth anniversary of the establishment of the Republic. For Italo-Turkish treaty, see **ARBITRATION, INTERNATIONAL**.

TUSKEGEE NORMAL AND INDUSTRIAL INSTITUTE. A non-sectarian, normal and industrial school for the higher education of Negro men and women, at Tuskegee, Ala., founded in 1881 by Booker T. Washington. The Institute gave regular and systematic instruction during the year to a total of 3323 persons distributed as follows: Preparatory, normal, and college courses, 1486; children's house, 377; summer school, 798; short course in agriculture, 192; short course for demonstration agents, 27; short course for vocational teachers, 29; annual clinical courses, 150; and 4-H club conferences, 264. Of the students registered for the regular courses in the winter term, 870 were men and 616 women. There were 274 members on the faculty, of whom 150 were men and 124 women. The endowment fund amounted to \$7,308,397, and the income for the year to \$485,206. There were 40,000 volumes in the library. President, Robert Russa Moten, LL.D.

TUTUILA. See **SAMOA**.

TYPHOID FEVER. **POLLUTION OF SWIMMING WATER.** Each year with the approach of the bathing season efforts are made by health officers to lessen the possibility of contracting typhoid from harbor waters, beaches, swimming pools, etc. If bathing in proscribed waters cannot be prevented, efforts may be made to treat the sewage with chlorine or otherwise. In examining suspected waters there has been a standard suggested for several years past and any water containing more than ten colon bacilli to 100 cubic centimeters has been pronounced unsafe. In the *American Journal of Hygiene* for May, 1928, Winslow and Moxon publish the report of a survey of the harbor at New Haven, from which it appears that only one bathing beach in the vicinity is safe for bathers. Many cases of the disease have occurred in that city which could be traced to bathing in the harbor or at the adjacent beaches and it may be recalled that the first cases of the disease traceable to oysters occurred in 1894 at Wesleyan University and that the oysters came from beds near the outlet of the New Haven sewers. Attempts at the sanitation of bathing beaches and harbors are patterned on older efforts directed against swimming pools, first ap-

plied at Tidal Basin Bathing Beach in Washington.

PERORAL IMMUNIZATION. This method of preventing typhoid fever has been tested in certain localities, such as industrial centres in parts of Europe. Dr. S. Hirsch relates his experience in the small industrial city of Osijek in Jugo-Slavia. Typhoid has prevailed as an endemic in this region for more than a century. Occasionally, as in 1903-05, the incidence has assumed epidemic proportions. In recent years the number of deaths and the mortality have both been relatively low, the city of 8000 inhabitants having from 50 to 100 cases annually with a death rate averaging about 6 per cent. The indigenous inhabitants seem more immune than the newcomers. This low incidence and mortality are evidently due in part to the ordinary anti-typhoid inoculation practiced on a large portion of the populace. Because of certain objections to this recourse, chiefly detention from work, the peroral method has been tested in sharply limited sections of the town, making use of the so-called "immunoids" obtained from the Hygienic Institute at Zagreb. Those previously immunized by inoculation were not included in the test. The interval covered was only a part of the years 1927-28. The number to develop the disease appears to have been very small, a few cases only for the latter part of 1927 and none at all during 1928. The results from the peroral method seem at least equal to those obtained by inoculation.

WATER AS CAUSE OF TYPHOID OUTBREAKS. Water is often regarded as the most common source of typhoid transmission, but in the experience of the State Department of Health of New Jersey for 20 years, comprising 180 outbreaks of typhoid fever including paratyphoid with 2643 cases, milk comes first, other foods in general, second, and water only third as the source of transmission; this despite the fact that pasteurization of milk was coming more and more into use. The risk from foods in general could be minimized by cooking and serving hot, but the public does not always take kindly to the use of heat which often militates against palatability. A concrete example under this head was the occasional rôle of salads in disseminating the disease and an epidemic at Freehold, of 36 cases with four deaths, was shown to have been due to eating chicken salad. The carrier problem was touched on only in a casual manner. Of 45 persons who took part in catering to the 500 people who partook of the salad one, who aided in cutting up chicken and celery, was found to be a carrier. In an earlier mass supper in Burlington Co., the percentage of those to contract the disease was much higher; thus, of about 300 participants, 201 were victims, salad having again been the medium of transmission.

TYROL. *tä-röl*. A crownland of Austria before the collapse of the Austro-Hungarian Empire, situated in the Alps; after the War it was divided between Italy and the new Republic of Austria. The former received the southern portion and the latter the northern. Total area before the War, 10,302 square miles; population, 946,613. Area of the Austrian province, 4882 square miles; population, according to the census of 1923, 314,836.

TYROL QUESTION. See **AUSTRIA**, under *History*.

UBANGI-SHARI. See **FRENCH EQUATORIAL AFRICA**.

UGANDA, ō-gān'dā, **PROTECTORATE**. A protectorate of Great Britain in East Africa; lying north of Tanganyika. For administrative purposes it is divided into four provinces: namely, Eastern Province, Northern Province, Western Province, and Buganda. Area, 94,204 square miles; population, estimated in December, 1926, 3,136,946, composed of 3,123,581 natives, 11,613 Asiatics, and 1752 Europeans. About 790,000 of the natives belong to the civilized Baganda, a race converted to Christianity.

The chief product is cotton, which is grown almost entirely by the natives on an area estimated at 583,400 acres in 1926. The other products include cacao, oil seeds, coffee, and Para rubber. The total exports for 1926 were £3,597,437, mainly cotton (£3,051,791). The import figures are not available because they are merged with those of the Kenya Colony. See **KENYA COLONY**. The combined imports into Kenya and Uganda in 1926 amounted to £7,441,000 and the exports from Uganda were estimated at £3,597,000. The decrease in 1926 as compared with 1925 was almost entirely due to the decrease in cotton shipments and lower cotton prices. The revenue in 1926 was £1,389,641; expenditure, £1,295,612. The protectorate is directly under the British Government, represented by a governor and commander-in-chief, but the native rulers are supported in the management of their own subjects. Governor and commander-in-chief in 1928, Sir W. F. Gowers.

UKRAINE. A region known officially as the Ukrainian Socialist Soviet Republic; including the autonomous Moldavian Socialist Soviet Republic (formed in September, 1924) and the following provinces of the former Russian Empire: Kharkoff, Poltava, Chernigov, Kiev, Volhynia, Ekaterinoslav, Odessa, Nikolaiev, Kremenchug, Donetz, Zhitomir, and Podolia. Area, 174,201 square miles; population, in 1926, 29,020,304. Capital, Kiev, with a population, in 1923, of 403,730. The great bulk of the population adheres to the Ukrainian Orthodox Church. In 1926 there were 17,832 elementary and secondary schools having 2,122,100 pupils. The soil is fertile and the chief products are wheat, rye, oats, beets, tobacco, corn, and potatoes. In 1925 there were 4,100,000 horses, 8,000,000 cattle, 9,300,000 sheep, and 3,600,000 pigs. In 1925-26 the budget balanced at 182,594,836 gold rubles. There are approximately 10,13 miles of railways in Ukraine, about two-thirds of which are State-owned; about 2500 miles were reported under construction. The Government of Ukraine is modeled on that of Russia. At the head of the administration is a council of people's commissars. See **RUSSIA**.

UNDERWRITING, **UNDERWRITERS**. See **INSURANCE**.

UNEMPLOYMENT. The beginning of the year saw the continuance of the discussion of the unemployment situation in the United States. Governor Smith and the New York State Labor Department insisted that New York State had seen a decrease of 66,000 persons in the State's factory wage earners. Similar reports were being made public in Ohio, Illinois, and New England. The New York Labor Bureau insisted that the total number of unemployed persons in the country was reaching 4,000,000, nearly one-tenth of the working population of the country. It estimated that the loss of employment over the period 1923-27 had been as follows in the specified industries: Manufacturing, 1,000,000; rail-

ways, 100,000; coal mines, 100,000; farm workers moved to town, 1,000,000. On the other hand there had been a gain of 300,000 workers in the building trades. This made a net loss of 1,900,000 workers. The Bureau, continuing its calculations, pointed out that a net increase in the working population over 1923-27 had been 3,000,000 and that therefore 4,900,000 workers were not being accounted for. It could place only 1,850,000 of these in the following industries: professions, amusements, public utilities, automobile sales and service, other distribution, miscellaneous. This left a net balance of 3,000,000. If to this figure the 1,000,000 unemployed of 1923 were added, we obtain the Bureau's estimate of four million persons not working in the winter of 1927.

The reader may ask, why these elaborate and disingenuous calculations? For the reason that there were no means of collecting unemployment figures in the United States. If the country had the system of public unemployment exchanges to be found in most of the European countries, it would be in a position to know at any given time how many people were actually out of work. Otherwise, recourse must be had to guessing. Governor Smith and Senator Wagner of New York were guessing that the figures were quite high, first because New York City was actually seeing a good deal of unemployment, and second, probably, because 1928 was a presidential year and Governor Smith was to be a candidate.

On the other hand, the Federal Bureau of Labor Statistics was guessing that the figures were low. The Bureau of Labor Statistics was in the Department of Labor which is headed by a cabinet officer. The National Administration was being attacked on the floor of the Senate by the political opposition. The Department of Labor's business was to know how many people there were out of work in the country (though it had no more means of knowing than the average editorial writer). Because the Secretary of Labor was opposed to such schemes as Federal employment exchanges, because the administration of which he was an officer did not publicly believe that unemployment existed, for a number of reasons the Department of Labor was guessing that the figures were low. Therefore, in March a statement was prepared for the Secretary of Labor by the Bureau of Labor Statistics to the effect that the total number of unemployed in the country was only 1,874,054, as against Senator Wagner's 4,000,000.

How were the Bureau of Labor Statistics' figures derived? They were based on the known figures for 1925 of the wage earners in the manufacturing industries and the railroads. From these 1925 figures, 1928 estimates were made. These estimates leave out the following industrial groups: agriculture, mining, clerical workers, domestic help, and persons engaged in trade. The process was:

1. In 1925 there were 10,136,370 persons employed in the two industrial groups cited.
2. For January, 1928, it was estimated that 9,383,263 persons were employed in the same groups.
3. There was a shrinkage of 753,107, or 7.43 per cent.
4. In 1925 there was a total employed group of 25,222,742 and if the same shrinkage is applied all along the line, the 1928 employed group would be 23,348,682 or a net loss of 1,874,054.

It seemed apparent to many that the Department of Labor was talking of a calculated shrinkage based on dubious estimates. It was generally charged that the unemployment debate in the Senate and in the newspapers was inspired by political motives. In the spring, the headlines disappeared from the city streets, statesmen therefore took this to assume that unemployment was over and the subject no longer made its appearance in newspaper columns and the floor of public assemblies.

It also seemed clear to many social workers that unemployment would continue to raise its head periodically unless a statesmanlike programme was developed and carried out. Such a programme to be effective, authorities agreed, must contain the following elements: Federal, State, and city employment exchanges; one form or another of unemployment insurance; and long-range planning of public works by public authorities. Without public employment exchanges in every district of the country, no real unemployment figures can ever be collected. The current figures in circulation were based on calculated shrinkage from one known census year to other periods following.

Unemployment insurance is necessary for the stabilization of industry and the real protection of the working populations. In at least one industry, that of men's clothing, private employment insurance made steady progress, as may be seen below. Finally, a system of long-term planning of public works with some sort of reserve ready to meet emergencies would help materially to tide over periods of depression. This last aspect of a programme for unemployment is discussed in the section immediately following.

PROSPERITY RESERVE. The Jones Bill incorporating an interesting attempt to cope with unemployment on a scientific basis was reported out of the Senate Commerce Committee in the spring. This measure carried an appropriation of \$150,400,000 for public works, i. e., rural post roads, river and harbor improvements, flood control, and public buildings, to be used only when the volume of construction work in the country had fallen 10 per cent for a three-month period, as compared with the average of the similar period of the preceding three years. This special appropriation was to be considered a "prosperity reserve" (a term coined by the American Association for Labor Legislation) to help meet the problems of unemployment.

John B. Andrews, at the public hearings before the Senate Committee, indicated that the plan for a "prosperity reserve" had the approval of engineering societies, associations of contractors, the labor movement, President Coolidge, Secretaries Mellon and Hoover, and Governor Smith. Mr. Andrews, in his argument for the measure, pointed out that a bill of the sort proposed would not only benefit men in public-works construction but would call upon at least 27 industries for materials, etc. Similarly, such a plan, reaching into every section of the country through the agency of the Federal Government, would undoubtedly stimulate activity elsewhere.

The plan, or something very much like it, immediately became a topic of the utmost importance when it was announced on November 21 that President-elect Hoover had placed his stamp of approval on it. The announcement was made by Governor Brewster of Maine at the Con-

ference of Governors which was holding its sessions at New Orleans. The Hoover programme, which was attributed to William T. Foster and Waddill Catchings of the Pollak Foundation, called for the creation of a \$3,000,000,000 State and Federal construction reserve fund "to do for labor and industry what the Federal Reserve has done for finance." Mr. Brewster's speech outlined the plan on the following lines: Under the scheme, public authorities would store up a reserve of construction projects equal in cost to two years' normal expenditure on improvements, and this reserve would be spent in times of unemployment. In 1928, public authorities were spending annually a billion and a half dollars on improvements. The accumulation of this amount for two years would act as the necessary reserve. The funds or a credit would be released when indexes should indicate the need. "No centralization of authority is proposed, but merely the creation of a condition by concerted action that shall make possible a remedy that will appeal persuasively to all. Follow the flow of these \$3,000,000,000 to the contractor, to the laborer, to the material men, to the factory, to the factory employees, to the merchants, to the farmer. It goes like the house that Jack built and unemployment is at an end.

"One might ask a certain number of questions: 1. How is this reserve to be built up? Does it mean that all public authorities are to stop construction for two years? 2. On what basis will periods of unemployment be determined? At the present time, no facilities exist for the registration of unemployment figures. One recalls the heated debate of the spring of 1928 when the Secretary of Labor insisted that there was no unemployment and when Democratic Senators insisted that there was. 3. Will the scheme mean concerted action by the States? Undoubtedly, the project was an ambitious one and, beyond question, there were serious difficulties in its way. As the year closed, the subject was still in a highly theoretical stage.

UNEMPLOYMENT FUND IN MEN'S CLOTHING INDUSTRY. Previous YEAR BOOKS have reported the success of the unemployment fund set up in the men's clothing industry by the employers and the Amalgamated Clothing Workers. In the Chicago district, the agreement was renewed for an additional three-year period from May 1, 1928, to May 1, 1931. The new agreement increased the employers' contribution to 3 per cent of their weekly pay rolls, while the contribution of the employee remained at 1½ per cent. It was estimated that through the increase the fund would total approximately \$1,000,000 at the end of a year. The Rochester district accepted the principle of the unemployment fund when a similar agreement was reached in April. By it, the employers contribute 1½ per cent of their weekly pay rolls and the employees make a similar contribution. However, the employers are to begin making their payments May 1, 1928, while the workers are not to start with theirs until a year later. The agreement carries a three-year term.

Similar action was taken by the employers in the New York district when an agreement between the New York Clothing Manufacturers' Exchange and the union was reached in June. The agreement was to hold from June 30, 1928, to June 30, 1931. Certain differences between the fund governing the New York district and those

of the Chicago and Rochester districts were to be noted. The employees were not to contribute toward the maintenance of the unemployment fund, but the total contributions were to come from the employers on the basis of a weekly contribution of $1\frac{1}{2}$ per cent of the total labor cost of all clothing manufactured whether by inside shops or outside shops. The fund was to be administered by a board of trustees made up of equal representatives of the employers and the union and headed by the impartial chairman of the industry for New York. Contributions were to begin Sept. 1, 1928, but unemployment benefits were not to be paid out before Sept. 1, 1929.

EMPLOYMENT AGENCIES. The United States Supreme Court, in a decision of May 28, found unconstitutional the law of New Jersey which endeavored to permit the State commissioner of labor to fix the fees charged by employment agencies. Mr. Justice Sutherland, who wrote the majority opinion in which five other justices concurred, found the law in violation of the due-process clause of the Fourteenth Amendment, in that the State was interfering with the conduct of a private business. The dissenting opinion was written by Mr. Justice Stone and was concurred in by Mr. Justice Holmes and Mr. Justice Brandeis. In view of the fact that there do not exist public employment exchanges, the decision of the Court was of the utmost significance. The *Monthly Labor Review*, in commenting on the decision pointed out that: The following States fix the fees to be charged by employment agencies: Arkansas, Colorado, District of Columbia, Illinois, Kansas, Maine, Missouri, Montana, Texas, Virginia, and Wyoming. The following States limit the fees to a percentage of the wages to be received: Connecticut, Iowa, Michigan, Nebraska, New York, North Carolina, Oklahoma, Oregon, Utah, Rhode Island. The following States require the filing or approval of schedules or both by State officials: California, Indiana, Minnesota, New Jersey, Ohio, Pennsylvania, South Dakota, Wisconsin. The *Monthly Labor Review* said further:

Because the United States Supreme Court has decided that the State may license and regulate private employment agencies and because the limitations on these decisions are that the State can not prohibit the business entirely nor can it fix the fees to be collected by the agency, all reasonable requirements for the licensing and continuation of the existence of the license may be required as long as the agency is permitted to exist and fix its own fees. . . . The States may make reasonable requirements so strict that only the honest and scrupulous can continue to carry on the business within the borders of the State.

TRADE UNIONS. It has been indicated here that the only method that will adequately cope with the problems of unemployment is some nation-wide scheme of unemployment insurance. There have been noted from time to time in these columns the various expedients being adopted for the solution of particular group problems. Trade unions, for example, have devised certain ways of coping with the evils of unemployment, as far as their own members are affected, naturally. For instance, a writer in the *Monthly Labor Review* points out, the following means for the prevention of unemployment are in general practice: membership in trade unions is restricted where unemployment prevails or the industry is overmanned; the Amalgamated Clothing Workers Union has succeeded in convincing employers that workers have a stake in their jobs and that therefore they are entitled to

indemnification when they are persuaded to leave the industry because their jobs have been eliminated because of machinery improvement; restriction of apprentices; equal distribution of all work available among all employees; the limitation of overtime; some unions operate their own employment exchanges and, where closed shops are recognized, agreements are often made with employers for the union to supply new workers. The same writer points out that the following methods are being employed for the relief of unemployment: the payment of benefits by a great number of local unions though the payments are generally small, the waiting period is quite long and the total sum is inadequate; exemption from dues is a practice more or less generally observed; some unions make loans to members out of jobs; some unions have started the machinery for the creation of unemployment insurance funds supported by the unions and the industries.

The unemployment plan of the Amalgamated Clothing Workers has been discussed here before. In the Chicago market, from May 1, 1923, to Oct. 8, 1927 the unemployment fund had collected contributions totaling \$3,878,956 and had paid out benefits totaling \$2,946,965. Some attempts were made in the women's garment industry in New York and Chicago for the creation of similar machinery and, in fact, in New York a plan had already been accepted by the employers in 1924 when internal dissension in the union put the whole scheme into abeyance; the fund, however, was to be resumed in July, 1928. A similar scheme was set up in the cloth hat and cap industry and was in operation in St. Paul, New York, Chicago, Philadelphia, Boston, Baltimore, Scranton, and Milwaukee. During the two years 1925-27, members received \$175,907 in benefits. The felt-hat workers of New York induced their employers to set up a scheme of the same character in their industry. It should be noted that in both the cloth-hat and felt-hat industries, the fund was built up entirely from employer contributions.

GREAT BRITAIN. On April 19 there went into effect the new British unemployment insurance act. The following is the new schedule of weekly contributions:

Sex and age	Employer's contribution	Employee's contribution	Government's contribution	Total
	Pence	Pence	Pence	Pence
Men aged 18 to 65	8	7	6	21
Women aged 18 to 65	7	6	4½	17½
Boys aged 16 and 17	4	3½	3	10½
Girls aged 16 and 17	3½	3	2½	8½

The new weekly benefits were to be as follows:

	Shillings
Men aged 18 to 65	17
Women aged 18 to 65	15
Boys aged 16 and 17	6
Girls aged 16 and 17	5
Dependents' benefit:	
For an adult dependent	7
For a dependent child	2

The additional grant for an adult dependent includes wives wholly dependent upon their husbands, dependent husbands physically or mentally incapable of self-support, widowed mothers, widowed stepmothers living with the claimant and totally dependent upon him. The additional

UNEMPLOYMENT IN EUROPE TOWARD CLOSE OF 1925, 1926, AND 1927

<i>Country and class of unemployed</i>	<i>Month</i>	<i>1925</i>	<i>1926</i>	<i>1927</i>

grant for dependent children includes children under 14, children between 14 and 15 who are school attendants, as well as stepchildren and illegitimate children.

EUROPE. Figures published by the *Monthly Labor Review* indicated that the unemployment situations in European countries were considerably improved in 1927, as compared with the two previous years. At any rate this was true for every country but Italy. It should be noted in the examination of these figures that they are in no particular case complete; the methods of their compilation are the same for the individual country, so that the figures for one year may be compared with those of other years. In short, they are useful in indicating whether or not unemployment in the particular country is on the decrease or increase. The figures are in most instances for the month of December. Note the decreases in unemployment over 1925-27 for Austria (13 per cent), Poland (48 per cent), Germany over 1926-27 (53 per cent), and France (35 per cent). Note Italy's increase of 235 per cent.

CANADA. In a report submitted to the Canadian Parliament by committee of the lower house, it was concluded that some time in the near future some system of unemployment insurance would be necessary to cope with the problems being presented. The committee underwrote a scheme of insurance based on compulsory contributions from the State, employers, and workers. As is the case in the United States, responsibility for the initiation of such projects resides in the provinces, but the Federal Government can go far in furthering the scheme by offers of Federal subsidies. It will be recalled that this was exactly the procedure followed in giving Canada a system of old-age pensions. (See OLD-AGE PENSIONS.) The committee found a difficulty familiar to students considering the problem in the United States, the lack of adequate unemployment statistics. It therefore further recommended that the Government take steps for the installation of a machinery for the measurement of unemployment.

QUEENSLAND. This state in 1922 placed on its statute books an unemployment insurance act by which a fund was to be built up through an equal contribution of 9d. weekly from the state,

the employer, and the employee. All workers, who had contributed to the fund for six months were entitled to a sustenance allowance after a waiting time of 14 days. No allowance was to be for more than 15 weeks in the year. During the year ending June 30, 1927, a total of £360,958 was paid out in allowances. Of the 45,594 males and 3386 females who made applications for the allowances during the year, refusals were made in the cases of 10,040 largely because of the inadequacy of the waiting time. Laborers predominated and the sugar industry appeared to be the chief source of continued unemployment.

ITALY. A decree signed in the spring made it compulsory for all unemployed to register at their district unemployment exchanges. Employers must choose persons from the registry lists and are to give preference to members of the National Fascist party and the Fascist trade unions. Employers must report to the labor exchanges the names of all new workers hired and those dismissed.

UNION COLLEGE. A non-sectarian college for men at Schenectady, N. Y., founded in 1795. The 1928 autumn enrollment of regular students totaled 823, distributed as follows: Academic, 563; electrical engineering, 104; civil engineering, 105; chemical, 34; physical, 17. In addition, there were 76 graduate students; and 300 enrolled in extension courses. There were 77 members on the faculty. The library contained 71,000 volumes. The productive funds amounted to \$4,000,000, an increase of \$500,000 over the previous year, and the income for the year was \$1,000,000. President Charles Alexander Richmond, LL.D., resigned on Sept. 24, 1928, after 20 years of continuous service, and Frank Parker Day, LL.D., formerly lecturer in advanced English at Swarthmore College, was elected to succeed him.

UNITARIAN CHURCH. A denomination believing in one God in one person, and consequently, in the purely human personality of Jesus. Unitarianism as a type of belief is ancient. The Unitarian Church in the United States developed as a modification of Congregationalism in New England, which led to the formation of the American Unitarian Association in 1825. This association is the executive organization of the Unitarian churches today. Each church is an independent congregation, and the denomina-

tion requires no adherence to a formal creed in its worshipers, and no profession of a particular doctrine in its ministers.

The one hundred and third annual meeting of the American Unitarian Association was held at Tremont Temple, Boston, Mass., May 22, 1928. On Jan. 1, 1928, the denomination had 422 churches, 386 of which were active. The Unitarian constituency was reported to number 131,912. There were 3273 Sunday-school officers and teachers, and 21,526 pupils. Receipts for current church activities, as presented in the treasurer's statement for 1928, amounted to \$367,527. General denominational work is carried on by departments, of which the chief are those of publication, religious education, church extension, social relations, new Americans, foreign relations, and recruiting the ministry. The church sponsors three theological seminaries: Harvard Divinity School; Meadville Theological School, Chicago, Ill.; and Pacific Unitarian School for the Ministry, Berkeley, Calif. Missionary work of the department of new Americans was carried on among American citizens and residents of Icelandic, Finnish, and Norwegian origin, in particular. The department of foreign relations kept in communication with groups holding similar beliefs in other parts of the world. Denominational publications are the *Christian Register* (weekly); the *Beacon* (weekly); and the *Unitarian Word and Work* (monthly). The Association has its headquarters at 25 Beacon Street, Boston, Mass. Its president in 1928 was the Rev. Louis C. Cornish; secretary, Parker C. Marean; treasurer, Henry H. Fuller.

UNITAS FRATRUM. See MORAVIANS.

UNITED BRETHREN IN CHRIST. A denomination which resulted from the religious awakening of Philip William Otterbein, Martin Boehm, and their co-workers. The church had its beginning at a "great meeting" held about 1766 in the Isaac Long barn near Lancaster, Pa. The first conference was held in Baltimore, Md., in 1789, and the church was formally organized in Frederick Co., Md., in 1800. Its theology is Arminian and baptism is administered by any mode desired by the applicant, while its beliefs are those of the earlier evangelical denominations. The church is divided into 35 annual conferences, including those in China, Japan, the Philippines, Porto Rico, and West Africa. In 1928 there were 1756 charges; 3071 organized churches; 1647 itinerant ministers; 406,678 church members, or a gain of 5125 over 1927; 2882 Sunday schools, with an enrollment of 387,348, including teachers and officers. The amount raised by the church for all purposes in 1928 was \$6,789,435, and the church buildings valuation amounted to \$28,754,501. Conference missionary appropriations amounted to \$107,801, the general home missionary appropriations to \$185,299, a gain of \$22,147 in the latter item. The church maintains the following educational institutions: Bonebrake Seminary, Dayton, Ohio; Otterbein College, Westerville, Ohio; Lebanon Valley College, Annville, Pa.; Indiana Central College, Indianapolis, Ind.; York College, York, Nebr.; Kansas City University, Kansas City, Kans.; Shenandoah College, Dayton, Va.; and Philomath College, Philomath, Oreg. Homes and orphanages maintained are Otterbein Home, Lebanon, Ohio; United Brethren Orphanage and Home, Quincy, Pa.; The Colonel R. M. Baker Home for Retired Ministers, Puente, Calif. The

United Brethren Publishing House (The Otterbein Press), and the headquarters of the church are located at Dayton, Ohio. *The Religious Telescope* is the official paper of the church, and *The Watchword* the young people's paper.

The General Conference of the Church of the United Brethren of Christ, a quadrennial session, was scheduled to convene in the Covenant Church, Lancaster, Pa., May 14, 1929. At the meeting of the Federation of Churches in Rochester, N. Y., in December, 1928, representatives of the Evangelical Synod of North America, the Reformed Church in the United States, and the United Brethren, met to consider the general problem of Church union, a step which would mean a denomination of more than a million members.

UNITED CHURCH OF CANADA. See CANADA, UNITED CHURCH OF.

UNITED METHODIST CHURCH. See METHODISTS, WESLEYAN.

UNITED MINE WORKERS. See STRIKES AND LOCKOUTS.

UNITED PRESBYTERIAN CHURCH. See PRESBYTERIAN CHURCH, UNITED.

UNITED STATES. AREA AND POPULATION. The area of the United States, exclusive of Alaska, is 3,026,789 square miles. The area of the non-contiguous lands, which include Alaska, Guam, and certain Pacific islands, Hawaii, the Panama Canal Zone, the Philippine Islands, Porto Rico, American Samoa, and the Virgin Islands (American), is 711,582 square miles, making a total area of 3,738,371 square miles. The estimated population of the United States on July 1, 1928, was 120,013,000. The population, according to the census of 1920, was 106,418,175. This does not include the population of the territorial possessions.

AGRICULTURE. The principal crops of 1928 exceeded those of 1927 by about 3 per cent, according to the estimates of the Department of Agriculture, in the total quantity produced and were less than those of 1927 by approximately 1 per cent in total value. The total acreage to crops was, for 1928, 360,979,020; for 1927, 357,186,100. The total value of 56 chief crops, as calculated upon prices of December 1, was estimated for 1928 at \$8,472,827,000, as compared with \$8,538,183,000 for 1927. The increase of about 1 per cent in acreage was the first material increase in a number of years. The change in acreage in 1927, from 1926, having been slight and the previous tendency having been toward smaller yearly acreage totals. By leading crops, pronounced changes in production were few. There was a falling off from the exceptionally high 1927 hay production of 123,327,000 tons, to a 1928 production of 105,953,000 tons. The potato crop was extraordinarily large, totaling an estimated 462,943,000 bushels, and thus exceeding the memorable crop of 421,585,000 bushels gathered in 1924. The crop was produced on an increased acreage, and was in part likewise due to an exceptionally high yield to the acre. The abundance of potatoes depressed the price to an average farm figure of 54 cents a bushel for the entire country, with the result that the total value of the potato crop, \$250,043,000, was the lowest in a number of years.

Fairly in line with the corresponding crops of the 1927 season were the 1928 crops of corn, 2,839,959,000 bushels, \$2,132,991,000; wheat, 902,747,000 bushels, \$877,793,000 the latter fig-

ure, however, being distinctly lower than that for 1927, owing to a lower average farm price for wheat. The cotton crop was materially higher than that of 1927, chiefly by reason of a higher acreage, but was lower in farm price and but slightly different in farm value. The cotton acreage of 1928 was 45,326,000; production, 14,373,000 bales; value, \$1,291,589,00. By States, the 1928 corn crop was poor in Texas, the wheat production exceptionally high in Kansas, oat production unusually high in Iowa, Illinois, and Minnesota. See AGRICULTURE, and articles on the separate crops, as CORN, WHEAT, ETC.

INDUSTRY AND COMMERCE. Activity in both commerce and industry in the course of 1928 was with few exceptions well maintained within the United States, and influences bearing upon it were mainly stimulating. The chief of the influences having to do with business activity were the national election, the enactments of the Congress, a very sanguine speculation for the rise in corporation stocks, and the settlement of labor difficulties in the coal fields. To the contrary of frequent experience in foregoing presidential years, uncertainty as to the result of the national election had no perceptible depressing effect on production or trade. A widespread anticipation prevailed that Herbert Hoover, the Republican candidate, would become President, and that in any case the Republican party would make considerable gains in the Senate elections, so that control of national affairs would remain, as actually happened, in the hands of the political group already controlling them.

The progress of an unprecedented upward movement in stocks had some adverse effect in that there was diverted into stock speculation, by various indirect channels, money that would otherwise have been available to serve the credit needs of commerce. This influence was probably more than offset by the sentiment of optimism generated by a demonstration of confidence, given through the stock market, in the earning prospects of American companies, and by the creation of large profits to speculators, which became available in some degree for commercial purchases.

The course of wholesale prices during the year was not conspicuously in either direction. For November, 1928, the price level of all leading commodities, after earlier minor fluctuations, stood at the same level as it had stood for November, 1927, namely, 96.7 per cent of parity with the average level for the year 1926. Increases during 1928 in prices among the metals, metal products, and building materials and to a smaller extent among hides, leather products and fuels, were counteracted by decreases in prices for farm products, foods, textiles, chemicals, and house furnishings. The volume of domestic business as expressed by car loadings was inferior to that of 1927, for the first half of the year, and superior for the second half, month by month, with the exception of a slight inferiority for August of 1928. The volume of car loadings, month by month, was more nearly even in 1928 than in 1927. Car loadings for the 52 weeks of 1928 were 51,576,731, according to the American Railway Association, as against 51,635,806 for the corresponding period of 1927 and 53,098,819 for that of 1926.

The volume of industrial activity in 1928, as estimated by R. M. Davis of the McGraw-Hill Publishing Company, was 7 per cent higher than

for 1927 and 9 per cent above 1926. According to some observers, a somewhat extensive although gradual invasion of the transportation field by motor transportation made comparative railroad freight-car loadings a not wholly accurate guide to comparisons of amounts of goods moved in different years. In contrast to the case of 1927, industrial activity in 1928 was well maintained toward the close of the year. Among the most conspicuously active industries in 1928 were the automobile, metal, and rubber industries. The lumber industry and, up to the last quarter of 1928, the textiles, were less active than in 1927.

The distribution of goods was considerably favored by improvement in the economic situation of a number of the Northwestern farming States. These had made good crops at fair prices in 1927 and the crop results of 1928 on the whole advanced agricultural prosperity. The total value of the 1928 agricultural products as estimated by the Department of Agriculture was but \$66,511,000 below that of the 1927 total, and exceeded the total for 1926 by \$662,572,000. Its purchasing power was therefore high by the standard of years subsequent to 1920.

The settlement of labor difficulties in the bituminous coal fields came somewhat late in 1928 to affect the distribution of goods, but was nevertheless a favorable influence. The United Mine Workers made the decision as early as July to cease the effort to maintain wages at the level of the Jacksonville Agreement, but the ensuing wage settlements in the divers unionized soft coal fields were not all attained until some months later. Their effect was to reduce acute unemployment in areas where the miners had stood out, and thus to restore the retail demand in the sections affected. With regard to employment in general, there occurred no other very sudden or striking amendment in the situation, but it was notable that the end of 1928 did not bring a renewal of the complaint of widespread unemployment heard in 1927. Among the most increasingly active of the distributors were the chain stores, of whom a group of 21 leaders reported in the first 11 months of 1928 total sales of \$871,903,434, or 15 per cent more than for the corresponding period of 1927. The mail order merchants likewise maintained a high level of activity, as a whole.

FOREIGN TRADE. The total value of exports for the calendar year 1928 rose sharply to \$5,129,132,000, as against \$4,864,805,773, for 1927. The imports of the United States on the other hand declined to \$4,089,930,000 for 1928, from \$4,184,378,182. There thus resulted an increase in the excess of a year's exports to \$1,039,202,000 for 1928, as compared with an excess of \$680,427,581 for 1927. Export excess thus exceeded \$1,000,000,000 a year for the first time since 1921. The 1928 total of exports was the largest since 1920; the import total, the smallest since 1923. The export total was made up in considerable part of automobiles and related goods, which formed about one-tenth of the 1928 total. Industrial machinery, agricultural machinery and implements and various iron and steel products made up approximately another tenth of the total. In the order of their importance as to total value, the chief imports into the United States were raw silk, coffee, crude rubber, cane sugar, hides and skins, and newsprint paper. Continued depression in the prices of rubber and cane sugar was among the influences that brought about a

low import total. The year in foreign trade was abnormal in that, while accumulating a larger favorable trade balance than had been attained in a number of years, the United States nevertheless ceased to draw gold from other countries on balance and actually exported in the course of the twelvemonth \$391,872,000 more of gold than it received. The outflow of gold occurred chiefly during the earlier months of the year, and was succeeded in the closing months by a renewal of gold arrivals on balance from foreign countries.

The Division of Statistical Research of the Department of Commerce estimated that approximately one-eighth of the product of the farms of the United States and one-eleventh of that of its factories were sold abroad in the fiscal year 1927-1928. The increase in value of exports, as scaled to offset the higher level of prices was found to be about 70 per cent over the corresponding total for the average year of the five-year period immediately preceding the War in Europe. Finished manufactures were reported as making up 43.2 per cent of the export total, by value, of the fiscal year 1927-28.

SHIPPING. For statistics and other information in respect to the shipping of the United States during the year, see articles SHIPPING and SHIPBUILDING.

MANUFACTURES. All the leading manufacturing industries are discussed under separate articles, such as AUTOMOBILES, BOOTS AND SHOES; IRON AND STEEL; PAPER; RUBBER; SILK; TEXTILE MANUFACTURING; ELECTRICAL INDUSTRIES; etc. For engineering works see under BRIDGES; CANALS; PORTS AND HARBORS; SHIPBUILDING; etc. See also CHEMISTRY, INDUSTRIAL.

Manufacturing in 1927, as determined by the biennial census of the Department of Commerce, attained the totals presented in the table on page 766 summarizing the more important groups of industries.

MINERAL PRODUCTION. The article MINERAL PRODUCTION AND RESOURCES gives the latest available official figures for mineral production in the United States. The more important minerals mined in the United States are treated in separate articles. There are also paragraphs on mineral production in the articles on the individual States.

FINANCE. For a discussion of Federal finances during 1928, see the article PUBLIC FINANCE.

EDUCATION. See the articles on EDUCATION IN THE UNITED STATES AND UNIVERSITIES AND COLLEGES. Separate articles on the most important universities and colleges are also given under their respective titles. Sections on Education are included in the articles on the several States.

RELIGION. A Federal Census of religious bodies in the United States, made public in September, 1928, indicated that 213 listed religious bodies in the country had, in 1926, 54,624,976 individual members, and possessed 231,983 buildings devoted to worship. The corresponding figures for 1916 were 200 denominations, 226,718 places of worship and 41,926,854 members. The apparent gain of 12,698,122 members in the aggregate total was affected by the reported change in the manner of counting Jewish worshipers, the figures for the year 1926 including numbers classed as seat holders and contributors only; the total of those of the Jewish faith as reckoned in 1926 was more than 3,700,000 above the total for 1916, and was about eleven times the earlier total.

Leading denominations and their memberships were stated to be as follows:

	1926	1916
Roman Catholic	18,605,008	15,721,815
Lutherans (21 bodies)	5,258,728	2,467,538
Baptists (18 bodies)	8,440,922	7,153,813
Presbyterians (9 bodies) ..	2,555,626	2,255,626
Methodists (19 bodies)	8,070,619	7,165,573
Jewish	4,087,357	357,135
Friends (four bodies)	110,417	112,982
Seventh-Day Adventists	110,998	78,355
Christian Church	112,795	118,737
Churches of Christ	433,714	317,937
Disciples of Christ	1,377,595	1,225,028
Greek Orthodox Church	119,495	119,871
Russian Orthodox Church ..	95,184	99,681
Protestant Episcopal	1,859,086	1,092,821
Congregational Churches	831,696	863,336
Latter-Day Saints	606,561	462,329
Unitarians	60,152	82,515
Spiritualists	50,681	29,028
Universalists	54,957	58,666
United Brethren	377,436	348,828
Moravians	31,699	26,373

Statistics and other information as to individual denominations are given in separate articles on the various religious bodies.

ARMY AND NAVY. The Army and Navy are treated separately in the articles MILITARY PROGRESS and NAVAL PROGRESS. See also article on AERONAUTICS.

VETERANS' BUREAU. Under an act of May 24, 1928, officers and former officers of the Army, Navy, and Marine Corps who had served in the War acquired equal retirement status with the officers of the regular establishments, and thus those that had incurred disabilities in the War with Germany became under certain conditions qualified to obtain a new type of benefit administered by the Veterans' Bureau. In the fiscal year 1927-28, hospitalization continued a leading activity of the Bureau. It had under treatment at the end of that year 25,899 hospital patients, as compared with 25,310 in hospital a year earlier. One-half of these, or 12,839, were hospitalized for various sorts of neuropsychiatric disability; 24 per cent, or 6273, for tuberculosis; and the remainder, 6787, for general medical or surgical ailments. The number of cases of pulmonary tuberculosis continued to decrease, while those of the psychiatric and general medical and surgical cases increased again, as in preceding years. State and civil institutions accommodated 8 per cent of the cases in hospital during the year; the special veterans' hospitals, 69 per cent; other government hospitals, 23 per cent. Admittances to hospital in the fiscal year numbered 73,270. The 50 hospitals operated by the Bureau had in operation on June 30, 1928, 22,156 beds, as compared with 20,810 beds a year earlier. Almost all the increase was devoted to neuropsychiatric cases.

Disability or death compensation claims filed with the Veterans' Bureau up to the end of the fiscal year 1927-28 totaled 1,099,803, this number being about 20 per cent of the entire number of those who had served in the armed forces of the United States in the War with Germany. There had been allowed up to that time 546,619 claims and disbursements exclusive of insurance had reached the total of \$1,249,821,507. A total of 40,904 veterans were receiving the monthly \$50 statutory award for cases of arrested tuberculosis. Compensation was being paid at the rate of \$2,542,103 in June, 1928, to dependents of 85,634 veterans who had died in actual service or of disability resulting from service.

MANUFACTURING WAGES, COSTS, AND PRODUCTION IN 1927

Industry	Year	Number of plants	Wage earners (average)	Wages	Cost of materials, fuel, power	Value of products	Value added by manufacture
All industries	{ 1927 1925 }	191,863 187,224	8,351,257 8,381,511	\$10,848,782,433 10,727,837,025	\$35,128,154,648 35,896,886,428	\$62,713,947,403 62,668,259,591	\$97,585,792,755 26,771,978,163

NOTE.—The comparability between the 1925 and the 1927 figures for cost of materials and value of products is affected somewhat by the fact that the manufacture of paper and wood pulp was treated as a single industry at the census for 1925 and as two industries at the census for 1927. The estimated market value of wood pulp made and consumed in the same establishments was not included in the cost of materials nor in the value of products of the combined paper and pulp industry for 1925, but was included in the 1927 value of products for the wood-pulp industry and in the 1927 cost of materials for the paper industry. This estimated value, as reported for 1927, was \$168,554,754.

The organization of the insurance offices of the Bureau was decentralized in the course of the year, to put policy holders in direct contact with offices in their own States with regard to all matters relating to their insurance contracts. Insurance applications in the course of the fiscal year were nearly double the number of the year previous, and totaled 187,579, aggregating \$1,028,923,938. There were in force at the end of the fiscal year 660,108 policies, amounting to \$3,111,994,905 of insurance.

The Adjusted Service Certificates issued up to June 30, 1928, numbered 3,302,667 and carried \$3,372,166,278. Loans on such certificates had been made by the Bureau, up to the end of the fiscal year, to the total of \$73,884,775. The net disbursements of the Bureau for the fiscal year 1927-28 amounted to \$439,157,199.63.

PENSIONS. The aggregate number of pensioners on the rolls of the Bureau of Pensions rose by 1252 in the course of the fiscal year ending June 30, 1928, the increase being the first in any year since 1905. The amount disbursed for pensions in the fiscal year decreased by \$1,197,040, from that of the year previous, to \$228,965,672. Pension claims on account of service in the war with Spain and the Indian wars were filed in considerable numbers under the rates fixed by the statutes of May 1, 1926, and Mar. 3, 1927. The rise in disbursements on claims of this class nearly offset the fall in the yearly total of payments to the rapidly dwindling group of the Civil War pensioners. The latter payments, for the fiscal year ending June 30, 1928, fell \$16,824,232 short of those of the year previous; Spanish War pension payments on the other hand exceeded those of the year previous by \$13,441,591, and Indian War payments advanced by \$1,943,177. Of approximately 414,000 soldiers who served in the war with Spain it was estimated that there were living 100,000 who had not yet made pension application, and that some 144,800, while on the pension rolls, were receiving less than \$50 a month each and might therefore become applicants, in most cases, for an increase.

The number of Civil War veterans receiving pensions at the end of the fiscal year 1928 was but 74,929, as against 90,000 a year earlier, and as against an estimated total of 2,213,365 who had served in the war. The number of Civil War veterans who died in the course of the fiscal year was reported as 15,237, or 17 per cent of the total of those living at the start of the year. The number of pensioned widows and dependents of Civil War veterans fell during the year to 197,934, from 212,642. The number of Spanish War soldier pensions rose from 138,812 at the outset of the fiscal year to 164,708 at its close; that of Spanish War veterans' widows, children, and dependents, from 23,547 to 26,195. Four of the veterans of the War with Mexico remained on the roll at the end of the fiscal year, out of six alive at its beginning.

Under an act of Apr. 27, 1928, inspired by the tragic loss of the crew of the submarine S-4 in December, 1927, double pension was granted in all cases arising from death or disability sustained through accident to a submarine vessel. An act of May 23, 1928, raised to \$40, from \$30, the pensions of Civil War veterans' widows of the age of 75 or over. An act of Mar. 26, 1928, entitled all veterans of the Federal Army, Naval, and Marine forces, including National Guard in Federal service, if disabled by wounds or disease and

lacking adequate means of support, to the benefits of the 10 branches of the National Home for Volunteer Soldiers.

Civil Service Retirement. The civil service retirement and disability fund, administered by the Commissioner of Pensions, stood on June 30, 1927, at \$68,336,761; it was augmented during the year by interest, transfers, and minor receipts to \$97,839,617, less \$14,761,617 paid out in allowances and annuities, and stood at \$83,078,000 on June 30, 1928. The sum of \$19,950,000, provided by act of Congress in 1928, was further to be available after the close of the fiscal year. The total of civil service annuitants on the roll on June 30, 1928, was 15,383. Of these, 3302 were receiving the maximum allowance under the law, \$999.96 a year; the average annuity was, however, much under this figure, being \$733.92. Of the annuitants, 2484 lived in the District of Columbia.

PATENTS. The number of applications for patents made to the Commissioner of Patents was higher in the fiscal year 1928 than in any previous year. Patent applications for inventions received during the year numbered 93,699, including designs and re-issues. Trade-mark and label applications numbered 23,252. Patent applications for inventions alone totaled 88,482, as compared with 84,511 for the fiscal year previous and 88,243 for the fiscal year 1922. There expired in the course of the year 33,573 patents. There were granted during the year 41,067 new patents for inventions.

POST OFFICE. The two most important occurrences of 1928 having to do with the conduct of the posts were the Federal enactment of May 29, 1928, revising postal rates and the issuance of an order on July 3 by the Interstate Commerce Commission allowing increased pay, to apply retroactively from July, 1925, to railroads for transportation of mails. Neither development affected the showing of the Post Office Department for the fiscal year ending June 30, 1928. Both applied to the fiscal year 1929. The increase in pay to the railroads for mail transportation was estimated to involve an additional yearly expenditure of about \$15,000,000 on the part of the Post Office and to create a further liability of some \$45,000,000 to meet deficiency in payments previous to the date of the order. The order directed an increase of about 15 per cent in the rates of remuneration to trunk lines transporting mail and a considerably sharper increase on the average to independent short lines. The postal-rate law of 1928 restored the 1-cent rate for private mailing cards; provided a system for the acceptance of reply cards and envelopes in the post without prepayment; made reductions in the second-class mailing rates for newspapers and periodicals sent out to the public; and reduced certain of the charges on third-class and fourth-class matter.

Deficit. Postal expenditures in the fiscal year 1928 exceeded revenues by \$32,121,096, transfer of \$15,351,321 to the Civil Service Retirement Fund being reckoned among expenditures. Disbursements for old obligations further raised the deficit to a total of \$33,363,149. The postal revenues of the fiscal year 1928 exceeded those of the year previous by \$10,511,933, and amounted to \$693,633,921. The expenditures showed a slightly greater rise, and were \$725,699,765.

Postage. Providing over 89 per cent of the revenue, the receipts of 1928 from postage total-

ed \$619,611,460. They were higher by 1.57 per cent than those of the year previous. The per capita expenditure of 1928 for postage was \$5.11. A considerable and growing part of the postage was paid without the use of stamps; the total thus paid in the year was \$88,636,582. New stamp issues of the year included a 2-cent Valley Forge commemorative issue, special-handling stamps of ten, fifteen, and twenty-cent denominations, a special surcharged Hawaiian series, and a 5-cent air mail stamp, conforming with a new minimum air mail rate.

Air Mail. In addition to inaugurating contract air mail service successfully in place of direct government service over the San Francisco-Chicago and certain other main routes, the Post Office established service on contract routes between Chicago and Cincinnati, Albany and Cleveland, New York and Atlanta, Atlanta and New Orleans, and on two routes from Dallas to Galveston and to San Antonio respectively. A number of other contracts for routes were awarded. Mail flights in the fiscal year 1928 totaled 5,585,224 miles; mail and equipment carried aggregated 1,861,800 pounds. Air mail postage was reduced to 5 cents for the first ounce and ten cents for every ounce additional. See AERONAUTICS.

Rural Mail Service. The number of rural mail routes was diminished by 442, in the course of the fiscal year, to 44,288; but the aggregate linear extent of the routes rose by 18,867 miles, to 1,289,613 miles. A consolidation of routes where practicable was in progress.

Mail Matter. In the fiscal year 1927, as reported in 1928, the post handled 26,686,555,729 pieces of domestic mail matter. These weighed 6,649,539,072 pounds. First-class mail contributed 16,283,564,220 pieces; in weight, 441,167,394 pounds. Second-class mail totaled 4,753,291,005 pieces, or 1,574,348,282 pounds; third-class, 4,061,604,835 pieces, 338,230,963 pounds; fourth-class (parcel post), 742,589,397 pieces, 4,061,911,966 pounds. Of outgoing foreign mail matter there were 356,316,608 pieces; in weight, 91,037,652 pounds.

Special Services. The postal savings system showed at the end of the fiscal year a total of \$156,329,957 held for depositors; the amount exceeded that of a year before by \$4,940,191. More domestic money orders were issued in 1928 but to a slightly lower total amount than in 1927. The number issued in the fiscal year 1928 was 197,336,882; the aggregate value, \$1,650,479,606. There were issued in the United States 2,793,593 international money orders, to a total of \$51,197,584.

DIPLOMATIC SERVICE. A few changes occurred during the year in the personnel of the American diplomatic service. William S. Culbertson, who had been Minister to Rumania, succeeded William Miller Collier as Ambassador to Chile, while another change in South America was the appointment of Alexander P. Moore, at one time Ambassador to Spain, as Ambassador to Peru, to succeed Miles Poindexter. Charles S. Wilson, who was Minister to Bulgaria, succeeded William S. Culbertson as Minister to Rumania, and H. F. Arthur Schoenfeld went to Bulgaria in his place; Jefferson Caffery, who had been Minister to Salvador, was appointed to the same position in Colombia in place of Samuel H. Piles, and was succeeded in Salvador by Warren D. Robbins. David E. Kaufman succeeded James S. Cottrell as Minister to Bolivia, and Franklin Mott Gunther filled the vacant post of minister to Egypt.

The following list gives the names of the diplomatic representatives from the United States in 1928:

EMBASSIES AND LEGATIONS OF THE UNITED STATES

Albania—Charles C. Hart, minister.
 Argentina—Robert Woods Bliss, ambassador.
 Austria—Albert Henry Washburn, minister.
 Belgium—Hugh S. Gibson, ambassador. (Also minister to Luxembourg.)
 Bolivia—David E. Kaufman, minister.
 Brazil—Edwin V. Morgan, ambassador.
 Bulgaria—H. F. Arthur Schoenfeld, minister.
 Canada—William Phillips, minister.
 Chile—William S. Culbertson, ambassador.
 China—John Van A. MacMurray, minister.
 Colombia—Jefferson Caffery, minister.
 Costa Rica—Roy T. Davis, minister.
 Cuba—Noble B. Judah, ambassador.
 Czechoslovakia—Lewis Einstein, minister.
 Denmark—H. Percival Dodge, minister.
 Dominican Republic—Evan E. Young, minister.
 Ecuador—Gerhard A. Bading, minister.
 Egypt—Franklin Mott Gunther, minister.
 Estonia—Frederick W. B. Coleman, minister. (Also to Latvia and Lithuania.)
 Ethiopia (Abyssinia)—Addison E. Southard, minister resident.
 Finland—Alfred J. Pearson, minister.
 France—Myron T. Herrick, ambassador.
 Germany—Jacob Gould Schurman, ambassador.
 Great Britain—Alanson B. Houghton, ambassador.
 Greece—Robert P. Skinner, minister.
 Guatemala—Arthur H. Geissler, minister.
 Haiti—(Vacancy) minister.
 Honduras—George T. Summerlin, minister.
 Hungary—J. Butler Wright, minister.
 Irish Free State—Frederick A. Sterling, minister.
 Italy—Henry P. Fletcher, ambassador.
 Japan—Charles MacVeagh, ambassador.
 Latvia—Frederick W. B. Coleman, minister. (Also to Estonia and Lithuania.)
 Liberia—William T. Francis, minister resident and consul-general.
 Lithuania—Frederick W. B. Coleman, minister. (Also to Estonia and Latvia.)
 Luxembourg—Hugh S. Gibson, minister. (Also Ambassador to Belgium.)
 Mexico—Dwight W. Morrow, ambassador.
 Morocco—Maxwell Blake, diplomatic agent.
 The Netherlands—Richard M. Tobin, minister.
 Nicaragua—Charles C. Eberhardt, minister.
 Norway—Laurits S. Swenson, minister.
 Panama—John Glover South, minister.
 Paraguay—George L. Creech, minister.
 Persia—Hoffman Philip, minister.
 Peru—Alexander P. Moore, ambassador.
 Poland—John B. Stetson, Jr., minister.
 Portugal—Fred Morris Dearing, minister.
 Rumania—Charles S. Wilson, minister.
 Salvador—Warren D. Robbins, minister.
 Serbs, Croats, and Slovenes, Kingdom of—John Dyneley Prince, minister.
 Siam—Harold Orville Mackenzie, minister.
 Spain—Ogden H. Hammond, ambassador.
 Sweden—Leland Harrison, minister.
 Switzerland—Hugh R. Wilson, minister.
 Turkey—Joseph C. Grew, ambassador.
 Uruguay—U. Grant-Smith, minister.
 Venezuela—Willis C. Cook, minister.

EMBASSIES AND LEGATIONS TO THE UNITED STATES

Albania—Faik Konitza, minister.
 Argentina—Dr. Don Manuel E. Malbran, ambassador.
 Austria—Edgar L. G. Prochnik, minister.
 Belgium—His Highness Prince Albert de Ligne, ambassador.
 Bolivia—Don Eduardo Diez de Medina, minister.
 Brazil—S. Gurgel do Amaral, ambassador.
 Bulgaria—Simeon Radeff, minister.
 Canada—Vincent Massey, minister.
 Chile—Don Carlos G. Dávila, ambassador.
 China—Sao-Ke Alfred Sze, minister.
 Colombia—Dr. Enrique Olaya, minister.
 Costa Rica—Don Manuel Castro Quesada, minister.
 Cuba—Don Orestes Ferrara, ambassador.
 Czechoslovakia—Ferdinand Veverka, minister.
 Denmark—Constantin Brun, minister.
 Dominican Republic—Angel Morales, minister.
 Ecuador—Don Gonzalo Zaldumbide, minister.
 Egypt—Mahmoud Samy Pasha, minister.
 Estonia—Colonel Victor Mutz, consul-general in New York, in charge of legation.
 Finland—L. Åström, minister.

France—Paul Claudel, ambassador.
 Germany—Friedrich W. von Prittwitz und Gaffron, ambassador.
 Great Britain—Sir Esme Howard, ambassador.
 Greece—Charalambos Simopoulos, minister.
 Guatemala—Dr. Don Adrian Racinos, minister.
 Haiti—Raoul Lizaire, secretary of legation and chargé d'affaires.
 Honduras—Luis Bográn, minister.
 Hungary—Count László Széchényi, minister.
 Irish Free State—Timothy A. Smiddy, minister. (Resigned, November, 1928.)
 Italy—Nobile Giacomo de Martino, ambassador.
 Japan—Katsupi Debuchi, ambassador.
 Latvia—Arthur B. Lule, consul-general in New York in charge of legation.
 Lithuania—Bronius Kasimir Balutis, minister.
 Luxemburg—Baron Raymond de Waha, chargé d'affaires.
 Mexico—Don Manuel C. Téllez, ambassador.
 Netherlands—J. H. Van Royen, minister.
 Nicaragua—Dr. Don Alejandro César, minister.
 Norway—Halvard H. Bachke, minister.
 Panama—Dr. Don Ricardo J. Alfaro, minister.
 Paraguay—Dr. Juan V. Ramirez, secretary of legation and chargé d'affaires.
 Persia—Mirza Davoud Khan Meftah, minister.
 Peru—Dr. Herman Velarde, ambassador.
 Poland—Jan Ciechanowski, minister.
 Portugal—Viscount d'Alte, minister.
 Rumania—George Cretziano, minister.
 Russia—Serge Ughet, financial attaché.
 Salvador—Dr. Don Francisco A. Lima, minister.
 Serbs, Croats, and Slovenes—Bojidar Pouritch, counselor of legation and chargé d'affaires.
 Siam—Lieut.-Gen. Phya Wittavongs, minister.
 Spain—Don Alejandro Padilla y Bell, ambassador.
 Sweden—W. Boström, minister.
 Turkey—Ahmed Mouhtar Bey, ambassador.
 Uruguay—Dr. Jacobo Varela, minister.
 Venezuela—Dr. Don Carlos F. Grisanti, minister.

ADMINISTRATION

THE PRESIDENT. President Coolidge was at variance with the Seventieth Congress at a number of points in the course of the first session. On matters of Mississippi flood prevention, farm relief legislation, naval expenditure, and the development of Muscle Shoals, he and his cabinet members received the support of an Administration group of the Republicans in Congress, but this group lacked the voting power to carry out his views. In the matter of the reduction of taxes, after having insisted on the need of a balanced budget, he finally yielded to the extent of signing a Revenue bill that left but a slight expected favorable balance for the year 1928-29, a balance which the August computations of Budget Director Lord converted into a prospective deficit of \$94,279,346.

In the matter of Mississippi flood prevention, the President yielded ground to the extent of signing a measure that did not, as he had proposed, make the States directly benefiting liable for a portion of the cost of the work, and that authorized expenditure on a greater scale than he had recommended. He vetoed in all more than a dozen measures, of which a salary increase for postal employees, involving \$6,456,000, a provision of rent, light, and fuel allowances for fourth-class postmasters, the granting of retirement pay to disabled emergency officers and the McNary-Haugen farm relief bill were important. The postal service increases and the emergency officers' pay act were passed over his veto, but the effort to re-pass the McNary-Haugen bill failed, as in 1927. The President in his message vetoing this bill scored it in language of a vigor marked with bitterness.

The meeting of the Pan-American Conference at Havana gave the occasion for President Coolidge to visit foreign territory for the first time in his tenure of the Presidency; he went to Havana and there delivered the opening address on Janu-

ary 16 to the Conference, starting back for the United States on the day following. In this address he praised the Conference as "a forum in which not the selfish interests of a few, but the general welfare of all, will be considered," and urged the observance, in the affairs of the New World, of the spirit of which "the most complete expression is the Golden Rule." He did not remain as a delegate at the Conference, Charles Evans Hughes filling the rôle of head of the United States delegation.

In an address of January 30, to the members of the budget-making group known as the Government's Business Organization, the President expressed the conviction, with regard to the Government, that "economy is here to stay," recommended a comprehensive programme for the replacement of obsolete naval vessels, and reviewed the reduction of National debt which surpluses achieved under the budget system had made possible. The visit of the aviator, Lindbergh, to Porto Rico was made the occasion of a demand from the legislature of that island in January, that it be admitted to Statehood; President Coolidge discouraged this proposal in a public letter addressed to Governor Horace M. Tower of Porto Rico, representing the condition of the island as more favorable than at any previous time in its history, its government as more liberal, and its people exercising a greater control over their own affairs.

In an address of April 15, accepting the statue of Andrew Jackson for the statutory hall in the Capitol, the President emphasized the course of Jackson in opposing the asserted right of secession in 1832, and in leaving the Treasury without obligations and with a surplus. President Coolidge delivered his Memorial Day oration at Gettysburg, and made it the occasion for a word on behalf of the negotiations with France and other nations for a treaty against war, as well as for a warning against the spread of criminality within the country.

Mr. Coolidge held himself apart from the presidential campaign, having definitely eliminated himself as a candidate by his declarations of the year previous. He made no public effort to influence the choice of his party in the presidential nomination, but passed the summer at an estate on the Brule River near Superior, Wisconsin, maintaining administrative contact through offices established at Superior. He accepted the resignation of Mr. Hoover as Secretary of Commerce on August 21 without improving the occasion to offer an extensive public endorsement such as might have served the purpose of the presidential campaign. Shortly before election day, however, he congratulated Mr. Hoover on his anticipated succession to the Presidency, in a brief but cordial personal message that was widely published.

FOREIGN RELATIONS. The chief feature of the State Department's conduct of foreign relations during the year was the negotiation of a treaty against war, signed at Paris August 27. The State Department continued to play a dominant part in the affairs of Nicaragua, where American Marines repressed insurgents while a national election was held under American control. The Nationalist Government of China was recognized, progress was made in matters under discussion with Canada, and Mexican relations continued in the harmonious state into which they had been brought in 1927 by Ambassador Morrow.

Nicaragua. Hostilities with the Sandinista in-

surgents were carried on throughout the greater part of the year, over a wide and rugged area, chiefly in the north of the country. Early in April according to news reports, troops of the Marine Corps in Nicaragua numbered about 3500 and were assisted by native auxiliaries. Engagements were on a small scale, the insurgents not attempting concentrations in any great number. Efforts on the insurgents' part were to capture towns or American plantations and mines, and to cut off detachments of the American troops, while the Marine forces sought to break up insurgent bands and to find and take their places of refuge. One of these, the summit of Chipote Mountain, was mastered in January, but its loss did not check the insurgents in other districts. Up to July 27, it was reported that about 600 of the insurgents had surrendered at one time or another. Marines extended their operations into Honduras in August, with reported consent from the Government of that country to pursuits of Sandinistas within its borders.

While this warfare was going on the State Department made arrangements to regulate the Nicaraguan election. It failed to obtain the passage in the House of Deputies at Managua of a law placing election supervision in the hands of Brigadier General Frank R. McCoy, U. S. Army. President Diaz, upon the rejection of this measure, issued, March 21, a decree according the desired authority to General McCoy. It was reported in August that the State Department had tentatively approved the placement in the United States of a Nicaraguan loan of \$12,000,000, which was not, however, taken up at that time by bankers. The Nicaraguan election was successfully held November 4, the country being under the guard of American Marines and sailors. Upon the election of Moncada, Liberal candidate, as President, a large part of the American forces were withdrawn. See NICARAGUA.

Treaty Against War. Secretary of State Kellogg had begun in 1927 his efforts to expand the Briand proposal of a treaty renouncing resort to war between France and the United States into the project of a similar treaty to include the principal powers with which the United States had relations. The principle of this extension was accepted by the French Government via Ambassador Claudel, January 4. A demonstration of friendly attitude was made shortly after this by the State Department in the notification sent to bankers that the Department would not oppose the flotation of loans to France. Such loans had previously been opposed, but the removal of official opposition did not result in any widespread French effort to borrow. The French Government while accepting the idea of a multilateral agreement against war, raised objection to the extent of the proposed pledge itself, maintaining that France being already committed by treaty obligations of defensive alliance could not undertake to abstain from any but aggressive war.

There followed a protracted exchange of views between the two capitals; a note of Foreign Secretary Briand, as reported January 21, proposed that the French Government protect its obligations by accepting the proposed treaty with reservations. This plan was not favored at Washington. In the meantime a Franco-American treaty of arbitration, strictly limited to that topic, was signed at Washington, February 6, to replace the expiring arbitration treaty. Its con-

clusion had little effect on the anti-war treaty negotiations. At the end of April, Secretary Kellogg declared that the intent in the proposed French reservations was not in his view inharmonious with the tenor of his treaty draft. The point was eventually settled by exchange of notes, France setting forth in a note the contingencies that she understood not to be covered by the treaty pledge, and the United States assenting.

Other nations were approached by the State Department, soliciting them to sign the proposed treaty. Germany, Italy, and, with reservations expressed by note, Great Britain accepted; likewise Belgium, Japan, Poland, and Czechoslovakia. At Paris on August 27, fifteen signatories subscribed to the treaty. They were the representatives of the above named powers and of France and the United States. For the chief parts of the British Empire there were seven signatories. In the treaty the nations (Article I) renounced war "as an instrument of national policy," and agreed (Article II) to settle disputes among them only by pacific means; Secretary Kellogg after the signature of the treaty by the original contracting parties sent identical notes inviting 48 other governments, Russia not included, to affix their signatures. Invitation to Russia was extended by the French Government. See KELLOGG TREATIES.

Other Foreign Relations. The Chinese Nationalist Government sent to Washington its former Foreign Minister, Chao Chu-wu, to seek to open relations with the United States Government. The Secretary of State, in response to his proposals, on July 25, sent a note through Minister MacMurray to the Nationalist Government expressing readiness to enter into negotiations on the subject of the tariff provisions in the treaties between the two countries. A treaty granting China tariff autonomy was immediately executed by MacMurray. These proceedings involved American recognition of the Nationalist Chinese Government. In April, a settlement of the Nanking affair of March, 1927, was reached, the Nationalist Government offering apology for the attack on Americans and the murder of Dr. J. E. Williams at Socony Hill, and the United States Government explaining that as its naval vessels had fired to cover the retirement of fugitives, it felt that its action on the occasion had been war-rantable. Damages and compensation to Americans were to be determined by a special commission of Americans and Chinese.

Relations with Canada during the year had to do chiefly with the diversion of water from the Great Lakes, with the project of a Great Lakes and St. Lawrence deep waterway, with measures to suppress transportation of liquor over the international border and with the status of persons crossing daily from Canada to the United States to go to employment in the latter. The Dominion renewed its representations early in the year as to the lowering of Lake levels by the diversion of water through the Chicago Drainage Canal; it accepted the finding of a joint board of engineers that the diversion there had affected the water level not more than 6 inches. Heavy rains in the summer raised the Lake levels sufficiently to deprive the subject of a degree of its formerly somewhat pressing character. Notes exchanged by the two governments, January-April, set forth numerous details of the stand of each with regard to the proposed waterway and hydroelectric installations along its course.

Accord was reached on the proposal to set the depth of channels at 27 feet instead of 25. Hugh R. Wilson, Minister to Switzerland, signed January 30 the Geneva convention on import and export restrictions.

Through the efforts of Secretary Kellogg the governments of Chile and Peru agreed July 13 to resume their mutual diplomatic relations, leaving their contentions with regard to Tacna and Arica to await later solution. Complaint that a Coast Guard cutter had violated British territorial waters by seizing suspected rum runners near Gun Key in the Bahamas in September, 1927, led the State Department to offer apology to Great Britain July 18 for the infraction. The State Department refused to interfere in the national elections of Panama, held August 5, at the request of members of the Conservative party.

INTERSTATE COMMERCE COMMISSION. On February 25, the Interstate Commerce Commission issued a decision denying to coal from more southerly points the 20-cent reduction of the rate to Great Lake ports that it had granted to Pennsylvania and Ohio coal in August, 1927. The entire course of the Commission on the Great Lakes coal rates aroused strong sectional antagonism; it led to the Senate's refusal to confirm the reappointment of Commissioner Esch. Permission was granted by the Commission May 18 for the Chesapeake and Ohio Railway Company to purchase control of the Pere Marquette, but that part of the application which sought consent to acquisition of control of the Erie system was denied. The Commission on May 18 cited the New York Central, Baltimore & Ohio, and New York, Chicago & St. Louis railroads for violating the Clayton Act in jointly buying control of the Wheeling and Lake Erie Railway Company.

The long continued proceedings as to the rates to be allowed railroads for carrying the mails were concluded July 30 by a decision of the Commission granting mail rate increases to the carriers to the aggregate of \$15,000,000 a year. A total of \$45,000,000 was further granted, to cover underpayment on the part of the Government subsequent to July, 1925. Purchase of the Kansas City, Mexico & Orient Railroad Company by the Atchison, Topeka & Santa Fe was approved by the Commission August 28. See **RAILWAYS**.

FEDERAL RADIO COMMISSION. The commission received by statute an extension of its powers to control radio broadcasting and allocate wavelengths for another year. Restrictions attached to this extension (see *Congress*, below) rendered the work exceedingly difficult. Hearings were held for many months, principles for determining cases in the matter of allocation were laid down and broadcasting licenses in great number were granted or refused. Broadcasters were carried along in the meantime on successive 30-day licenses.

FEDERAL TRADE COMMISSION. At the instance of the Senate the commission opened an investigation early in March into the activities of electric light and gas utilities and of their national associations. Evidence was brought out that tended to show that State or regional associations affiliated with the national groups had effected publicity by various means chiefly for the purpose of combating the movement for public ownership of utilities and the proposals to build great hydroelectric enterprises at public expense.

A director of an information committee in Ohio testified that the introduction of 15,000 copies of a textbook, "Aladdins of Industry," into the public schools of that State had been effected. It was testified that a proposal to issue municipal bonds in Cleveland for a municipal power plant had been opposed in 1925 with organized speakers and with matter in 625 Ohio newspapers. Records of the expenditures of similar committees in Georgia and Florida were alleged to have been destroyed. Evidence was produced to the effect that in Missouri booklets prepared by a publicity organization had been used in 690 high schools. In Nebraska, it was testified, a former member of the State Railway Commission, becoming director of the Midwestern division of the National Electric Light Association, had brought about a distribution of some 4000 textbooks in the public schools. Other testimony of like character was obtained.

SHIPPING BOARD. The Shipping Board held a conference of private operators of ships January 10 and 11 to obtain their views on the needs of private shipping. In February it submitted to Congress its recommendations for legislation; these included grants of long-term contracts at liberal figures for the transportation of foreign mails, easier terms for future loans to domestic builders and operators of ships from the construction fund, tax exemption for vessels in foreign trade, the grant of two months' pay a year to Naval Reserve officers and men serving in the American merchant marine in foreign trade, and several other proposals. The policy of selling ships into the hands of private operators was pursued; bids for purchase of the vessels of three government-owned Pacific lines were accepted February 16. The Board decided July 3 to offer for sale the United States Lines, the American Merchant Lines and the American Palmetto Line.

MISSISSIPPI RIVER FLOOD CONTROL COMMISSION. This body was created by the Flood Control Act of 1928, which specified that it should consist of three members, one the Chief of Engineers, U. S. A., one the president of the preexisting Mississippi River Commission, and the third a civilian expert appointee of the President. The new commission had for its expected function the work of bringing the plans of the old commission and those of the army engineers into harmony. The President appointed Carleton W. Sturtevant May 16 as the appointee member to the new body. Colonel Charles L. Potter, president of the old Mississippi River Commission, relinquished that post at the beginning of July, and was succeeded by General Thomas H. Jackson. Thus the latter and Maj. Gen. Edgar Jadwin became the two ex-officio members of the new commission. The three visited the scene of the proposed flood control works in July and made a report, issued August 15. This document approved the Northeastern Louisiana and Atchafalaya Basin flood diversion projects of the Jadwin report, and also favored fuse plug control of flood discharge over levees, a form of automatic control, as opposed to spillways to be opened by official authority, such as the Mississippi River Commission had favored. The report was favorable to the policy of leaving extensive overflow areas along the course of the river, on the theory that the raising of levees, alone, would not suffice to take care of flood waters.

CABINET CHANGES. Herbert Hoover, upon his nomination as Republican presidential candidate, tendered to President Coolidge on July 6 his resignation as Secretary of Commerce. After a period of seven weeks, the President on August 21 accepted the resignation, and appointed William F. Whiting, a manufacturer of Holyoke, Mass., Secretary of Commerce. Secretary of the Interior Hubert Work resigned his position in July to become the Hoover campaign manager, and on July 20, Roy O. West of Chicago, a lawyer and political party worker who had managed the finances of the Coolidge 1924 campaign, was appointed to the Interior post.

CONGRESS

SEVENTIETH CONGRESS, FIRST SESSION. On reassembling after the holiday recess, early in January, Congress had still before it almost the entirety of its session programme, although a revenue bill had been rapidly put through the House in the previous December, carrying tax reductions much beyond what the Secretary of the Treasury had submitted as the possible maximum. The Senate Finance Committee, on the suggestion of Secretary Mellon, postponed action on this measure until the end of March, when the first quarterly payment on income taxes based on incomes of 1927 might be expected to clarify tax reduction possibilities.

Composition of Congress. The Senator-elect from Illinois, Frank L. Smith, whose eligibility had been challenged at the opening of the session, was reported ineligible, January 17, by a special committee, which found that a considerable part of Smith's primary campaign fund had been contributed by utility interests. The Senate accordingly by a vote of 61 to 23 on the 19th declared the Illinois seat vacant. The vote was largely but not entirely partisan, 39 Democrats and 21 of his fellow Republicans, as well as one Farmer-Labor Senator, voting against Smith. Governor Small of Illinois declared on the following day that he regarded the Senate's course as unwarranted, and he thereafter refused to nominate a Senator for the place, which remained vacant throughout the session. The seat of Senator-elect Vare of Pennsylvania remained likewise vacant while investigations relative to his primary campaign and the Pennsylvania Senate election of 1926, contested by Wilson, the Democratic candidate, went on. There were thus 47 sitting Republican Senators, 46 Democrats and one Farmer-Laborite. In the House the contest on the eligibility of James M. Beck, Republican, was settled in his favor early in February.

Senate Resolutions and Investigations. The Senate Committee on Elections moved January 26, for a recount of election ballots cast in Philadelphia and five other urban counties of Pennsylvania, where William B. Wilson challenged the vote rendered for Vare in 1926. The U. S. Supreme Court granted, March 12, to another Senate committee, that headed by Reed of Pennsylvania and inquiring into the Vare campaign, a writ of certiorari requiring Delaware County election officials to surrender the November, 1926, ballots. The Reed committee sought to compel Sheriff Thomas W. Cunningham to disclose the source of his \$50,000 contribution of 1926 to the Vare campaign fund, and he was placed under Federal indictment on a charge of contempt of the Senate. The Reed com-

mittee in the meantime applied to the courts for an affirmation of its power to require the surrender of the Delaware County ballots of November, 1926; on appeal, the U. S. Supreme Court decided that the committee could not do this on its own authority, having received no explicit authority to that effect from the Senate.

A subcommittee of the Committee on Privileges and Elections, headed by Waterman of Colorado, sat in Philadelphia in July and obtained testimony of practices alleged to have been used by the Vare organization in the registration of voters, the printing of ballots above the required number, and the stimulation of voting by the payment of voters' poll taxes. The special committee inquiry into the Hearst documents purporting to show that several members of the Senate had been declared by Mexican officials to be amenable to bribery, which was begun in 1927, was concluded by a report delivered in January, 1928. The committee found the documents to be spurious, and to bear forged signatures of President Calles and the Secretary of the Mexican Treasury.

The Senate rejected, March 16, the President's nomination of John J. Esch to the Interstate Commerce Commission; Mr. Esch, previously a member of the Commission, was charged with having changed his vote when the Commission, after denying, granted lower rates from the northern field to coal destined to the Great Lakes. A resolution against a President's serving for a third term, offered by LaFollette of Wisconsin, and inspired by efforts to induce President Coolidge to run again for the Presidency, was adopted by the Senate February 10, by a vote of 56 to 26. The Norris resolution, also, to amend the Constitution so as to advance the date of presidential inaugurations to January 15 and the commencement of a newly elected Congress to January 2 following its election, was again passed by the Senate, by a vote of 55 to 6, on January 4. The Senate had passed it in three previous sessions, but the House on no occasion gave it the necessary favorable vote.

As in 1924, the Senate created a special committee, April 30, to investigate expenditures of candidates for the presidential nomination. This committee later obtained figures on the expenditures of all the candidates prominent as contenders for the nomination in either party. In a resolution of an unusual character, the Senate May 7 requested the U. S. Supreme Court to hear arguments to be offered by the counsel for the National Conference on Railroad Valuation, D. R. Richberg, in the O'Fallon Railroad valuation case. The move was opposed as an act of interference with the judiciary, but the resolution was carried by a vote of 46 to 31, the more radical element being in the majority.

Among new inquiries started by the Senate was that of a special committee which visited the Ohio-Pennsylvania bituminous coal-mining area, where excesses in the use of mine police and of court injunctions against coal strikers had been alleged. The committee, under Gooding of Idaho, took testimony chiefly in the Pittsburgh district in February and March, and brought to view many matters of complaint of the striking miners. Walsh of Montana moved for a Senate inquiry into the activities of public utility corporations, but the Senate, rejecting this proposal, referred the matter of inquiry

February 15 to the Federal Trade Commission. Charges made in a letter left by L. S. Peterson, a postmaster at Douglas, Ga., who died by his own hand, indicated that he had been a victim of a system of enforced contributions levied by members of the Republican organization in his State. The Senate took cognizance of the charges and created a committee which, under the chairmanship of Brookhart of Iowa, sat during the summer at Atlanta, Ga., and in several other Southern States and elicited testimony of exactions levied upon holders of postal appointments.

Revenue Legislation. While the House had passed a revenue bill in the previous December, the Senate did not take up the subject until the close of March. The Finance Committee retained the finance measure in its hands in the interim, in response to a suggestion of Secretary Mellon, proposing the delay as a means of getting further information on predicted tax receipts, through figures on the March 15 payments. Democrats on the committee sought immediate consideration of the measure on January 17, but were defeated by a strict party vote. The committee finally, April 26, reported its bill, which provided tax reductions of an estimated yearly total of \$203,865,000, as against \$289,000,000 provided in the House measure. The Senate bill as reported retained the estate tax, made the corporation income-tax cut 12½ per cent instead of 13½ per cent, made reductions in surtaxes on incomes from \$18,000 to \$70,000, removed the 3 per cent automobile tax, raised the corporate income tax exemption to \$3000, exempted from tax theatre admittances up to \$3, and made other lesser changes; it sought to make surtax reductions apply retroactively to 1927 incomes; it preserved the taxes on club dues, capital stock and produce exchanges. It differed from the House measure chiefly in allowing less reduction of corporation tax, the House having put the corporate income-tax rate at 11½ per cent. The Senate approved its committee's 12½ per cent rate by a vote of 40 to 34 May 12. On May 14 it voted the committee's cuts in surtaxes on incomes up to \$80,000, but rejected the committee's proposal that these cuts should apply to 1927 incomes. A Democratic plan of surtax revision was at the same time defeated. On the contention of Senator Norris of Nebraska that the oil scandals had rendered it advisable to have full publicity as to income-tax returns, the Senate voted May 18 for an amendment providing publicity. Continuing to vote the several features of the measure in succession, it next voted retention of the estate tax, May 19, although Administration leaders had recommended that this tax be removed. A graduated income tax on small corporations, supported by the Democratic group, had been voted into the bill May 12, with the aid of two Republicans, but was cast out again on reconsideration, May 21, chiefly on the ground that it would have reduced revenue by about \$24,000,000.

When the entire bill came before the Senate for a vote, May 21, the Democratic members voted generally against it, and a tie vote of 33 to 33 resulted. Vice President Dawes in the chair cast the deciding vote in favor of the bill. It then went to conference committee, where the compromise plan of a reduction of the corporate income tax to 12 per cent was

adopted, the Senate's surtax cut of some \$25,000,000 abandoned, and the \$3 theatre-ticket exemption accepted. As a result of opposition in the conference committee, the income-tax publicity proposal was renounced by the Senate in a vote of May 26, and the whole conference committee bill adopted by the Senate on the same day without record vote. The House concurred on the 26th. The bill as passed thus carried repeal of the 3 per cent tax on automobile manufacturers, reduction of the corporate income-tax rate to 12 per cent, and other tax changes furnishing an aggregate estimated yearly reduction of \$222,495,000 in revenue. Although this reduction exceeded the total that Secretary Mellon had indicated as the safe maximum, President Coolidge signed the measure May 30.

Mississippi Flood Control. The previously created House Committee on Flood Control, reflecting sentiment adverse to President Coolidge's recommendations of December, 1927, on the plan and financing of works to prevent inundations in the lower Mississippi Valley, reported, February 16, a bill of its own, much at variance with the Jadwin plan. This measure provided that the Federal Government should bear the entire cost of the work; contemplated expenditure of \$473,000,000 as against the Jadwin plan's \$290,400,000; proposed the creation of a Mississippi Valley Flood Control Commission of seven members to be nominated by the President and to have charge of the entire project (the membership was finally fixed at three); and empowered this commission to acquire for the Government by purchase or condemnation in the Federal courts all lands needed for floodways, spillways, and levees. In effect this last provision was taken as placing in the hands of the Federal Government not only the power but the burden of land acquisition.

In the Senate the Committee on Interstate Commerce introduced February 29 a measure occupying a middle place between the Jadwin plan and the House bill. The Senate bill indicated a total expenditure of \$325,000,000; provided a committee of three engineers, including Major General Jadwin, to deal with features of the problem; stipulated that communities must supply lands for levees before the government expended any money on levee work; and proposed that where existing levees had not yet been brought up to the stipulations of 1914 local communities should bear one-third of the cost of raising them up to that point. The committee introducing this bill had sought the opinions of divers officials, including that of Secretary of Commerce Hoover, who had, as a witness, expressed belief that the question as to States or localities sharing in the cost might be left to a commission to determine. After only brief consideration, the Senate passed its committee's flood control bill March 28 by a vote of 70 in the affirmative and no nays. Senator Jones of Washington, chairman of the committee that framed the bill, informed the Senate that the cost contemplated in the bill might be exceeded and that actual expenditure might run to \$500,000,000.

The House took up the Senate bill April 18, President Coolidge seizing the occasion to express his disapproval of the measure as "exortionate" and likely to involve expenditure of \$1,500,000,000. Madden of Illinois proposed

an amendment designed to save the Government from damage liability for a floodway in Missouri and a spillway in Louisiana, but the House rejected this amendment April 23 by 142 votes to 73. On the 24th it enacted the bill by a non-partisan vote of 254 to 91. The measure then went to conference committee, which took cognizance not only of differences between the two houses but of the President's objections. In deference to his views three amendments were made, namely: limiting Federal flood liability to lands not yet overflowed, which should become overflowed in connection with future flood work; stipulating that the Government should not have to pay for river or channel rights of way over natural floodways; and rendering the Mississippi River Commission, in place of the Flood Control Board, the agent for making reports on surveys of tributaries of the Mississippi. The House, May 8, and the Senate, May 9, approved the amended bill, which the President signed May 15. An appropriation was made separately to cover expenditures of the initial year of flood-prevention work.

Shipping. Senator Jones, chairman of the Interstate Commerce Committee, introduced in the middle of January a bill designed to regulate the policy of the Shipping Board in the sale of vessels of the government-owned merchant fleet, and to promote ship construction and operation. It forbade the Shipping Board to sell any vessel save by unanimous vote and as serving in its judgment to the upbuilding of the merchant marine—a restriction in opposition to the recommendation in the President's December message. Shipbuilding to replace units of the merchant marine was also authorized. Democrats and anti-administration Republicans combined to pass the measure January 31, by a vote of 53 to 31.

In April the House Merchant Marine Committee reported a measure of its own, which included provision for government aid to private shipowners out of a construction fund of \$250,000,000, this revolving fund to be created for the purpose. This fund was to operate somewhat in the same manner as the construction loan fund under the then existing law, but was to be more liberal, allowing loans up to three-fourths of construction cost and requiring only 3 per cent interest of the borrower. Provision was made for mail contracts that would assist ships to meet operating costs. Sale of government-owned merchant ships was made allowable by a vote of only five of the six members of the Shipping Board. The House passed the measure without roll call, the Senate adopted the modification of its ship sale restriction and the President, May 22, signed the bill. For further discussion see SHIPPING.

Disabled Emergency Officer Veterans' Pay. A measure known as the Fitzgerald Bill, which had failed of passage in the Sixty-ninth Congress, was reintroduced and was reported by the House Committee on Veterans' Legislation, January 10. It granted the standard retirement pay for disability of 30 per cent or more, incurred in line of duty, to the veteran emergency officers who had not participated in this benefit accorded to other services. The measure was estimated to provide about 75 per cent of full salary for some 1850 officers. An identical bill was introduced in the Senate by Tyson of Tennessee. Strong public support helped this legislation,

which was passed by both houses, but which President Coolidge vetoed May 22, on the score of economy. Congress was at the moment smarting under the veto of the McNary-Haugen Bill, and the Senate and the House immediately, May 23, repassed the measure by the required two-thirds majorities. New extensive hospitalization projects of the Veterans' Bureau were also authorized by law.

Postal Rate Cuts. In accordance with earlier recommendations of the Postmaster-General, a bill was introduced in the House January 13 by Griest of Pennsylvania, Chairman of the Committee on Post Offices, reducing zone rates on magazine advertising to 1.75 cents a pound in the first zone as a minimum and to correspondingly reduced rates in other zones, up to 7.75 cents in the eighth zone. The transient newspaper and magazine rate was cut to 1 cent for 2 ounces, from 2 cents; the first-class post-card rate from 2 cents for private cards, was reduced to 1; a new facility, the business reply card and envelope, at not over 2 cents over the regular rate of postage, was provided; third-class and parcel-post rates were also cut. The reductions affecting newspapers were supported by the American Newspaper Publishers' Association which had ceaselessly opposed the rate increase of 1925. The House passed the measure April 2. The Senate passed a somewhat different measure, and finally a conference measure, reducing some of the zone rates still further, to the 1920 basis, was accepted May 26 by both houses.

Muscle Shoals. A proposed joint resolution, offered in the Senate by Norris of Nebraska, providing for future Federal operation of the power plant erected at Muscle Shoals on the Tennessee River, was voted March 13 by the Senate. The House, in place of this resolution voted (May 16) the Morin Bill, providing that a \$10,000,000 government-owned corporation be created, to employ Muscle Shoals for the manufacture of fixed nitrogen to be sold for use in the compounding of fertilizers. The bill authorized the sale of surplus power, and the completion of Dam Number 2 of the Muscle Shoals project as well as of a dam some 400 miles upstream at Cove Creek in Tennessee. Fertilizer companies offered protest to the bill as injecting the Government into their business. The bill was modified in conference committee, in deference to Senate objections to government fertilizer production, so as to commit the Shoals production only to furnishing fixed nitrogen in form "immediately available and practical for use by farmers."

McKellar and Tyson of Tennessee and several other senators from Southern States opposed the bill and conducted near the end of the session a filibuster to prevent its passage. The measure nevertheless passed May 25 by a vote of 43 to 34. The President failed to sign it within the 10-day period, and it was generally supposed to have died by way of the pocket veto, but Senator Norris, its Senate proponent, maintained that the question of the validity of an unratified act of Congress, which the President had omitted to sign not between Congresses but between sessions, was under adjudication in the United States Supreme Court in the *Ocanogan Indian* case.

The Radio Board. The Senate passed February 6 the Watson Bill to extend the control over

radio broadcasting, exercised by the Federal Radio Board, for one year beyond March 15. In the House, the Committee on Merchant Marine, responsive to complaints of representatives from sections holding that they had not received their fair share of radio allotments, reported a bill requiring that wave lengths be allotted within the several States in proportion to population and area, and dividing the country into five radio zones to receive equal allocations. The House passed this measure March 12 by 236 votes to 133. Senate conferees accepted the equal allocation feature in substance, reserving for the Board the liberty to dispose as it saw fit of such wave-length allotments as any State or section might not claim, and stipulating the population basis for allocations. In this form the measure was enacted, and was signed March 23.

Farm Relief. Efforts in Congress to furnish some form of government assistance to the farming industry centred again in the McNary-Haugen Bill. This measure made its appearance in the Senate March 8, in a modified form, in which the equalization fee, although retained, was relegated to the place of an alternative to successful operation through loans and advances, to be used only in case other methods of controlling crop surplus should not suffice. The House Committee on Agriculture reported the equivalent bill March 26, after rejecting a substitute proposal, the Ketcham-Jones Bill, which provided a scheme of agricultural debentures. Chairman Haugen of the Committee pointed out that the new measure had met a number of the objections voiced by the President in regard to the predecessor measure of 1927, notably by leaving the President unrestricted in appointments to the Board. The division in both houses over the measure was very similar to that in the previous year.

The Senate on April 12, after defeating a motion to drop the equalization-fee provision, passed the bill by 53 votes to 23. Those in favor included 24 Republicans and 28 Democrats. In the House, the Administration Republicans offered strong opposition and succeeded May 2 in winning the adoption of a substitute, the Aswell Bill, by a vote of 141 to 120, in committee of the whole. On the very next day, however, the supporters of the McNary-Haugen Bill, reversing this action, enacted their measure by 204 votes to 121. Minor amendments made in conference committee were followed by repassage in both houses. The President after a week of consideration vetoed the measure in a message characterizing it with exceptional severity of language as unconstitutional, deceptive to the farmer, impractical, autocratic, and as "bureaucracy gone mad." The Senate in a vote of 50 to 31, May 25, failed of the two-thirds majority needed to enact the measure over the veto, and hope of better results in the House was abandoned.

Naval Building Programme. The House Naval Committee, in considering a bill for a Naval construction programme accorded a hearing to Secretary of the Navy Wilbur, who on January 12 asserted the need of the Government's proceeding to build in the succeeding 20 years 71 war vessels, including 15 cruisers of 10,000 tons each and many smaller cruisers; of the cost, \$740,000,000 was to be expended in eight years, as part of the 20-year programme. This, in all,

was to cost \$2,580,000,000. A strong adverse sentiment to so large a plan developed, and the committee eventually reported a bill to authorize only the construction of 15 10,000-ton cruisers and one airplane carrier at a combined estimated cost of \$274,000,000, to be completed within six years. Representative Andrew of Massachusetts, in reporting the bill, indicated that the extra cruisers were regarded as a minimum need, and were required for scouting and screening duties with the capital fleet, as well as for dispersed duties. The House passed the bill March 17, by a vote of 287 to 58, with no provision of a time limit on the construction, and with a proviso that at least half the cruisers should be constructed in government yards. With this proviso somewhat modified, the bill came out of committee May 3, in the Senate. A rider offered by Borah of Idaho, favoring a restatement and recodification of the rules and law governing the conduct of belligerents and neutrals in war at sea was rejected by the committee. The Senate later defeated the entire measure by an adverse vote of 144 to 22 on May 26.

Boulder Dam. Strenuous efforts were again made, as in the Sixty-ninth Congress, to enact legislation that would authorize Federal construction of the proposed dam on the Colorado River at Boulder Canyon. The Senate bill of Johnson of California was reported March 16, by the Irrigation Committee, with several amendments, in part conciliatory to the opposed States. One among these proposed that 37½ per cent of profits from sales of power be turned over in equal parts to the States of Arizona and Nevada. Another rendered it requisite that at least six of the seven Colorado River States ratify the compact permitting the project to go into effect. Another amendment accorded to California not more than 4,600,000 acre-feet of the entire estimated 7,500,000 acre-feet of water to be impounded. The bill was nevertheless opposed by Hayden of Arizona. It was kept from coming to a vote until the closing rush, when Hayden, with aid from several Southern members, conducted a filibuster which prevented a vote on the measure. The House had passed the equivalent measure, the Swing Bill, without roll call May 25.

Other Legislation. An Administration measure for funding the debt of the Greek Government to the United States Treasury, \$18,125,000 in all, within the term of 62 years by payments yielding the equivalent of principal and a little more than 2½ per cent compound interest, was reported, with provision for the extension at the outset of a further loan from the Treasury to Greece, of \$12,167,000 to complete the work of the Refugee Settlement Commission, but the bill did not pass.

An Alien Property measure was enacted, providing for return of property to an estimated value of \$264,609,000 seized from German nationals in the course of the War, and for financing payment of claims of American citizens against Germany to a total of about \$191,729,000, as well as for payment of not over \$100,000,000 by the United States for ships, patents, radio stations and the like seized by it but not committed to the Alien Property Custodian. By concurrent resolution, Congress late in March postponed for a year, until July 1, 1929, the date of application of national-origins quota

system of the Law of 1924, as to the enforcement of which Representative Snell, Chairman of the Rules Committee, informed the House that the Administration had found no census figures sufficient on which to base quota calculations.

All bills for a reapportionment of representation in the House failed, as in previous sessions, and the apportionment on the basis of the census of 1910 remained in force. With regard to enforcement of the Prohibition law, appropriation of \$13,000,000 was made for the Prohibition Bureau in the ensuing fiscal year, and of the \$28,640,000 appropriated for the Coast Guard about \$15,000,000, according to an unofficial estimate, was destined to meet the cost of the activities of that service in enforcement of Prohibition and Narcotic laws. Pay increases to a total of about \$20,000,000 to 135,000 government employees were enacted. An increase totaling an estimated \$20,000,000 of pensions to widows of Civil War veterans was granted. A public building plan of approximately \$265,000,000 expenditure was authorized. The sum of \$5,000,000 was appropriated to fight the ravages of the pink boll worm in the cotton area. The construction of a boulevard from Washington to Mount Vernon was authorized. Congress adjourned May 29.

The Oil Investigation. The Senate voted January 9 that its Committee on Public Lands, as provided in a motion of Norris of Nebraska, investigate matters connected with the Continental Trading Company, a Canadian Corporation, which had figured in the Teapot Dome oil lease disclosures. The committee called Robert W. Stewart, Chairman of the board of the Standard Oil Company of Indiana, alleged to have been one of the men who had taken part in a transaction by which the Continental Trading Company had purchased petroleum from the Mammoth Oil Company and had resold it at a sharp advance in price. Stewart at first refused to testify, beyond saying that he had never received any of the profits of the transaction, amounting to some \$3,000,000, nor been involved in the distribution of the money. Contempt proceedings were brought against him in the District of Columbia, and he was compelled to give further testimony. The committee meanwhile obtained records and information purporting to show that \$800,000 of the Continental deal proceeds had passed to James E. O'Neil, who had paid the sum later into the treasury of the Prairie Oil Company, with which he was connected; \$763,000 to H. M. Blackmer, sought as a witness but residing in France; and \$233,000 to Albert B. Fall. The sums had been distributed in the form of Liberty bonds.

A further sum of \$26,000 was at this time traced to the Republican National Committee as recipient, and it appeared that H. S. Osler had received \$61,000 for organizing the Continental in Canada. Neither Blackmer nor O'Neil came within subpoena jurisdiction when sought by the committee, which proceeded March 1, to examine Will H. Hays, former Postmaster-General and in 1920 chairman of the Republican National Committee, on the Sinclair contributions to the Republican National campaign fund. Hays stated that Sinclair had contributed \$260,000 in Liberty bonds in 1923, to apply to the 1920 campaign deficit of \$520,000. This was to stand as a donation only to the extent of \$75,-

000; the remainder was to be transferred indirectly. A total of \$160,000 of the bonds were, according to Hays, put in the hands of certain leading party members, who thereupon were to deliver to the National Campaign fund equal value, whether in the identical bonds or in some other medium. Hays testified that \$100,000 of the bonds were eventually returned to Sinclair. The late James A. Patten, a grain operator, testified March 8, to having played dummy donor in one case in a contribution of \$25,000 for which he received an equivalent amount in First Liberty bonds. Secretary of the Treasury Mellon testified that he had received \$50,000 from Hays in Liberty bonds late in 1923, but had not immediately been told of Hays's purpose, and that some days later, on learning this purpose, he had returned the bonds, but had later made an actual contribution of \$50,000 to the deficit.

The late John T. Pratt was named as having received \$50,000 and made contribution in his name to like amount. William M. Butler, Chairman of the Republican National Committee after Hays, testified to having refused to make under his own name a contribution of \$25,000 of someone else's money. An alleged deposit slip of Stewart's account in the Commercial National Bank of Chicago came to light, indicating that coupons on a large number of Liberty bonds had been credited to him. Finally, April 24, Stewart again appeared before the Committee, and testified that he had received from Osler, president of the Continental Trading Company, \$759,500 in Liberty bonds, but insisted that he had merely placed the bonds in the control of Roy J. Barnett, an officer of his own company. Sinclair, testifying before the Committee April 1, admitted having received \$767,000 in Continental Trading Company profits, and said that he had turned the sum over, with interest, to the Sinclair Crude Oil Purchasing Company, shortly before testifying.

A report on the investigation, written for the Committee by Senator Walsh of Montana, was rendered in the closing hours of the session; it dealt severely with the Continental deal as creating profits as to which no satisfactory evidence had been found that the companies in which the Continental participants were officers had originally been designed to share. Senator Borah sought subscriptions in March from the public for the purpose of restoring the money contributed to the Republican campaign fund by Sinclair, in the interest of the party's good name. The fund had attained about \$7000 by July 8, after which subscriptions lagged. It was announced shortly after election that subscriptions would be returned to the donors.

SEVENTIETH CONGRESS, SECOND SESSION. The two houses of Congress convened in regular session December 3. On the following day was read the Presidential Message, the last of the series of such messages from President Coolidge. It reviewed the state of the Nation, pointing out that one-third of the National debt had been paid, that the National income was estimated to exceed \$90,000,000,000 a year, that the cost of National defense had increased \$118,000,000 in the past four years, and that Veterans' Relief expenditures, standing at \$765,000,000 a year, were on the increase. The reduction of Federal taxation was declared to have stimulated business, while permitting of the prosecution of

many improvements. The President asserted, with regard to farm relief, that the Government should "aid in promoting orderly marketing and in marketing and in handling farm surpluses clearly due to weather and seasonal conditions," but reiterated his views against "putting the Government directly into business, subsidies and price fixing . . . as a substitute for private initiative." He approved of the proposal to create a Federal Farm Board with advisory powers and of a revolving fund to aid in the establishment of farm marketing agencies. A former recommendation of legislation to encourage consolidation of railroads was repeated.

No further river and harbor legislation, it was recommended, should be passed until "we could see our way out of" work already authorized, including Mississippi River flood control. Development of the Colorado River in the manner suggested by the special board considering the subject was recommended. Greater leasing authority for the Secretary of War over the Muscle Shoals property was solicited. Federal remedial legislation against the crime of lynching was favored, so far as it might be constitutionally achieved. With regard to Prohibition, the President asserted that the Government was doing all that it could for enforcement, and was "entitled to the active coöperation of the States."

In his separate budget message, President Coolidge presented a budget for the fiscal year 1930 showing estimated receipts of \$3,851,295,829, expenditures of \$3,780,719,647, and surplus of \$60,576,182. He declared that there was no further prospect of tax reduction and that a renewed increase of taxation and a curtailment of Government activities were alike out of the question. He expressed the belief that if the French debt agreement were not ratified prior to the maturity of the \$400,000,000 portion falling due on Aug. 1, 1929, receipts from the French Government under the latter head should be applied to the retirement of the United States war debt.

The Colorado River Board of engineering experts submitted to Congress a report, December 3, recommending the construction of a dam in Black Canyon, twenty miles distant from Boulder Canyon, in preference to the latter site. It proposed an undertaking to cost \$165,000,000 or somewhat more, as against the \$125,000,000 previously estimated, and including a dam 550 feet high. The House Committee on Ways and Means made preparations to hold hearings on tariff revision with a view to general revision of the tariff at a subsequent special session.

Colorado River Development. The main achievement of the session up to the close of the year was to enact a measure for developing the water resources of the Colorado River, thus disposing of a highly complicated matter that had for years stood at an impasse. The measure commonly known as the Swing-Johnson Boulder Dam bill formed the basis of the enactment, but was radically modified by amendments in the Senate, prompted by the report of the engineers' commission on the project and by need of compromise in allotment of water resources, in favor of Arizona. The measure in its final form contemplated the construction of the main dam not in Boulder Canyon but in Black Canyon.

Johnson of California brought up the bill

in the Senate December 5, as unfinished business of the previous session. The bill as it had passed the House was then substituted in chief part for the previous Senate measure. Phipps of Colorado offered an amendment to increase the appropriation to \$165,000,000, from \$125,000,000, in conformity with the engineers' recommendations, and to set aside \$25,000,000 of the total for works of flood control, chiefly around the Imperial Valley. The increase was adopted, but a further Phipps amendment to render necessary the assent of all seven of the Colorado Basin States to put the project into operation was defeated, and the earlier provision that after six months following the signing of the bill the assent of six of the States should suffice was retained. An amendment proposed by Phipps provided that the Federal Power Commission might not issue power development licenses along the Colorado River until final approval of the act, but an exception was made of licenses for power development along the Gila River, in Arizona territory.

The Senate proceeded December 12 to settle the vexed matter of the allotment of water use among the rival States. The bill followed the provision of the Colorado River compact that the three Lower Basin States should have 7,500,000 acre-feet of water among them. Of this total, California had insisted on a minimum of 4,600,000; while Arizona Senators had set 3,000,000 as the minimum for their State. The Senate by a vote of 48 to 20, with the Arizona delegation in favor and the Californians opposed, voted an amendment giving California 4,400,000 acre-feet, 2,800,000 to Arizona, and 300,000 to Nevada. Ashurst of Arizona made no headway with an attempt to gain recognition for the asserted right of his State to tax exports of its half of the water of the river. The Senate on December 14 sidetracked the issue as to whether the Government should itself build the power plant at the Colorado River, by defeating an amendment of Borah of Idaho, to render government construction mandatory. This apparently left the determination of the point ultimately in the hands of the Secretary of the Interior.

The Senate passed the measure December 11, by a vote of 64 to 11, almost evenly divided as to party. The Arizona Senators, although they had given up efforts to filibuster when the Senate adopted closure of debate in the final hours, voted against the bill. In conference committee, the House contingent accepted the Senate measure as offered. The House adopted the conference report December 18 and sent the act to the President. In Arizona, the Legislature was in special session at Phoenix, and hastened to memorialize the President, urging that the act was unconstitutional and unfair, and that he veto it. Disregarding the protest, President Coolidge signed the act December 21.

Treaty Against War. The treaty for the renunciation of war, negotiated by Secretary of State Kellogg with the chief Powers and signed at Paris August 27, came before the Senate for ratification. It went into the hands of the Committee on Foreign Relations, and with it a proposed resolution of Moses of New Hampshire, that the Senate qualify ratification by some limiting declaration of its understanding of the obligations to be assumed. The committee voted

December 18, by 14 to 2, to recommend ratification of the treaty, without proposing in its recommendation any limiting declaration. There developed an opposition between the advocates of the treaty and those of the measure for cruiser construction left unpassed by the previous session. Supporters of the naval building programme apprehended that ratification of the treaty might have the effect of checking sentiment for a larger navy. They accordingly sought to obtain prior consideration for the cruiser bill. A compromise reached by unanimous consent December 20 arranged that the cruiser bill should come up as unfinished business in legislative session at the reconvening of the Senate on January 3, and that the treaty should come up on the same day in executive session.

Other Bills. A supply bill carrying \$813,215,735 for the needs of the Treasury Department and \$303,423,434 for those of the Post Office Department was passed, after difficulties raised by the opponents of the Prohibition system. The opposition in the House pointed out that the provisions for enforcement of Prohibition amounted to only some \$32,000,000, including those for the enforcement work of the Coast Guard, and condemned the allowance as deliberately inadequate, thus virtually challenging the supporters of Prohibition to include in the Treasury allowance a larger figure. The bill none the less passed the House promptly December 7, without increase in the contested item. When it came up in the Senate, Bruce of Maryland, one of the opponents of the existing Prohibition policy, cited a declaration that Prohibition Commissioner Doran had made a few days before, to a Congress committee, to the effect that it would require \$300,000,000 a year to render his work completely effective. Bruce moved that this amount be allowed, and offered an amendment giving \$270,627,384 for the activities of the Prohibition Bureau, this being the sum that Commissioner Doran had mentioned, less the cost of Coast Guard work. The Senate avoided debate by passing the measure with this amendment, relying on the conference committee to put the figure back at its original total. This the conference committee promptly did. The bill, carrying \$13,500,000 for the Prohibition Bureau, was passed by the Senate December 17, though after considerable protest against alleged insincere or inadequate enforcement, and by a majority of but three. The House passed also, December 10, an appropriation of \$283,287,963 for the Department of the Interior.

A bill to divest prison-made goods of their immunity from exclusion by State action, and to that end relinquishing Federal control over such goods as articles of interstate commerce, was passed by the Senate December 20. Three bills to provide a country residence for the President near the capital, as suggested by President Coolidge, were offered in one House or the other.

The nomination of Roy O. West to be Secretary of the Interior was the subject of hearings before the Senate Committee on Public Lands and was opposed on the ground of his former connection with the Insull power interests. The committee voted a favorable report on West December 19.

Congress adjourned December 22 for the year-

end recess, and was to reconvene January 3, 1929.

JUDICIARY

The United States Supreme Court in a decision of March 19 upheld the consent decree entered in 1920 against five leading meat-packing companies of Chicago, under which these companies were forbidden to engage in other lines of food business, a course which wholesale grocery associations had feared as likely to bring about a food monopoly. The Supreme Court declared the right of the Attorney-General to enter into agreements for decrees of this type. On an appeal of J. W. Hampton, Jr., & Company of a case relating to Constitutional tariff powers, from the United States Court of Customs Appeals, the Supreme Court sustained the lower court's decision, and Chief Justice Taft, in an opinion, declared constitutional the provision of the Tariff Law providing for flexibility of rates through Executive action. In a Supreme Court decision of May 14, sustaining the Philippine Island Supreme Court, the Board of Control Act of the Insular Legislature was declared void; this act had decreed that power to vote government stock in the Philippine National Bank and in the National Coal Company should pass from the sole hands of the Governor-General to those of a board of three, namely the Governor-General, the president of the Philippine Senate, and the speaker of the Philippine House. In a decision of May 28 the Supreme Court held a Pennsylvania State tax on corporation profits invalid as applying to corporations only and not to partnerships and individuals.

A petition for a mandamus, brought by the American Silver Producers' Association and others, to compel the Secretary of the Treasury to purchase silver at \$1 an ounce, as the petitioners contended that the Pittman Act of 1918 provided, was denied by the District of Columbia Supreme Court June 26. At New York, the Circuit Court of Appeals upheld, February 6, the conviction of former Alien Property Custodian Thomas W. Miller on a charge of defrauding the Government. The Circuit Court of Appeals at New York on March 5 reversed the decision of the Circuit Court at Buffalo in the matter of the daily crossings of Canadians having business in the United States. It held that such persons were not immigrants nor subject to the cited portions of the Immigration Act of 1924 and rules of the Department of Labor. The Government later requested that the Court reconsider this issue as fraught with results affecting the successful enforcement of immigrant restrictions.

The Oil Cases. The chief occurrence in the courts in connection with the Fall-Sinclair-Doheny oil leases was the retrial and acquittal of Harry F. Sinclair on a charge of having conspired with Secretary of the Interior Albert B. Fall to obtain a corrupt lease of Naval Reserve oil lands. The case having come to a mistrial late in 1927 on account of the alleged shadowing of jurors by detectives working in the interest of the defendant, it was called in the District of Columbia, April 9, before Justice Jennings Bailey and a jury of the District. Testimony given in the previous trial was again presented, and Clarence C. Chase, a son-in-law of Fall, testified that he had made efforts, when Fall came under sus-

picion, to have payments from Sinclair appear to have come from another person. The defense maintained that the Sinclair payments to Fall were made for interest in the Fall ranch property in New Mexico, on the belief that it might have petroleum under it. The jury acquitted on April 21. Sinclair was declared guilty and sentenced to six months in prison, on February 21, on the secondary charge of contempt of court, having to do with the operations of detectives in following and spying upon jurymen in the course of his first trial. William J. Burns, head of the detective bureau engaged in this work, and certain subordinates were sentenced to shorter terms. All the defendants appealed.

NATIONAL ELECTION

PRIMARY CAMPAIGN. Months in advance of the National conventions of the major parties, brisk contests were carried on in either party for support in State presidential primaries on behalf of several candidates. Seventeen States held primaries for the designation of delegates to the National conventions; two, New York and Illinois, chose district delegates by primary election and delegates-at-large by convention; and the remainder named their delegates altogether at state conventions. On the Republican side, Herbert Hoover, ex-Governor Frank O. Lowden of Illinois, Senator Charles Curtis of Kansas, and Senator Frank B. Willis of Ohio, were prominently brought before the public in the pre-primary publicity, while a number of favorite sons enjoyed support each in his own State.

Opponents of Hoover in his own party made efforts to promote the causes of these favorite sons, with a view to bringing about the pledging of as many State delegations as possible, so as to prevent his early nomination in the convention. Secretary Hoover countered by means of a letter of February 12 to Colonel Thad Brown of Columbus, Ohio, presenting himself as a presidential possibility in Ohio. New Hampshire elected an uninstructed Republican delegation, and North Dakota, the other State to hold a presidential primary before April, elected a delegation solid for Lowden. The name of Hoover was presently entered also in the California, Indiana, and Maryland primary campaigns, Hoover's invasion of Willis's own State of Ohio gave rise to a strenuous contest, in which Hoover did not, indeed, himself take direct part, but in which his supporters on one side and Willis on the other were extremely active. While delivering a speech, Willis was taken ill and died suddenly March 30. Time was lacking to replace his name with another on the primary ballots and in the vote of April 24 many thousand votes were cast for him, while the Hoover delegates were elected over a disorganized opposition. In subsequent State primaries and conventions, Hoover was the dominant figure. Supporters of Lowden late in May felt this so keenly that they started organizing a "Corn Belt Committee" to influence the convention in the name of the agricultural group and thus if possible avert the Hoover nomination.

In the Democratic party the pre-convention struggle was somewhat similar. Governor Alfred E. Smith of New York, whose conflict with William G. McAdoo for the presidential nomination in 1924 had deadlocked the New York convention, stood forth as the most conspicuous presidential possibility. McAdoo did not again seek primary

support but lent his influence to aid the cause of Senator Thomas J. Walsh of Montana. Walsh, a Catholic like Smith, with a record of able service in the oil cases, was an outspoken advocate of the Eighteenth Amendment and the Volstead Law. His candidacy was pressed in Wisconsin, California, and South Dakota. The Democratic primary in McAdoo's own State of California went to Smith on May 1, rendering it apparent that he would be the dominant candidate at the nominating convention. Thereupon, much as in the Republican case, an attempt at breaking party solidarity was initiated. The California manager of Senator Reed of Missouri, one of the Democratic favorite sons, proposed to Josephus Daniels, a Southern Dry Democrat and former member of the Wilson cabinet, that a third ticket be nominated, with either Borah or Reed for President and Daniels for Vice President. Daniels rejected the proposal, and pronounced for party regularity.

NATIONAL CONVENTIONS. Republican. The Republican National Convention assembled at Kansas City, Mo., June 12. It contained a small but determined group of Lowden supporters from several of the Midwestern States, who did their utmost to block the Hoover movement. On June 13, the demonstration by which some of the Lowdenites had hoped to storm the convention was attempted. A crowd of picturesquely accoutred farmers presented themselves at the convention doors and struggled for admittance, which the guards denied them. The news accounts reckoned them as numbering hardly over 500, and their mood, while discontented, was by no means savage. The failure of their demonstration left the Lowden cause less capable of resisting the Hoover candidacy than before.

Platform. A Republican platform was adopted by the convention on June 13. It began by endorsing the record of the Coolidge administration, declaring the wisdom of Republican policies and the capacity of Republican administrations, and pledging the maintenance of the Coolidge policies. It cited the high level of wages and living, the increasing enrollment of schools and colleges, and the decrease in Federal taxation, as evidences of wise government. The Coolidge economies were stressed, as was the reduction of the National debt in the period 1921-28 under Republican National direction. The party was pledged to "such further reduction of the tax burden as the condition of the Treasury may from time to time permit." The protective tariff was asserted to be "a fundamental and essential principle of the economic life of this nation." The Tariff Act of 1922 was pictured as having "justified itself in the expansion of our foreign trade during the past five years." The "cancellation of foreign debts" was opposed and adherence to the "foreign debt policy now definitely established" was promised. The Act of Mar. 10, 1928, was stated to have solved satisfactorily the problem of the claims arising out of the War with Germany, Austria, and Hungary. Administration policies toward Mexico, Nicaragua, China, and the League of Nations were approved.

The platform promised "firm and consistent support of American persons and legitimate American interests in all parts of the world." Improvement of employment and retirement conditions in the Civil Service was recommended. The depression of agriculture was ascribed to belated readjustment following the War. Advances

made to farmers through the Federal Farm Loan system and the Intermediate Credit banks were hailed as effective aid to the farmers; likewise, the raising of tariffs on farm products under the flexible tariff provision. "Without putting the Government into business," a phrase suggesting possible allusion to the McNary-Haugen Bill, the platform favored a Federal system of organization for farm marketing. The party was declared hopeful and willing to assist in any feasible plan for the stabilization of the coal industry that would be just to miners, consumers, and producers, thus dealing with the coal-mining labor troubles that had occurred.

Declarations were made in favor of continued Federal highway appropriations; of the right of collective wage bargaining; of the lowest railroad rates allowing for maintenance and a reasonable return to investors; of promoting merchant shipbuilding under the White-Jones Act; of Mississippi River flood control; of waterways connecting the Midwest with the sea; of "further liberalizing the laws applicable to veterans' relief"; of Federal protection from exactions of the utilities; of maintaining the Federal Water Power Act. Without affirming the benefits of the Eighteenth Amendment, the platform pledged its "vigorous enforcement" as a part of the Constitution.

The fact that "any official has ever fallen" from the standard of honesty was deplored and the maintenance of honesty in the Federal employ was promised. The party undertook not to create any campaign fund deficit such as that of 1920. It proposed keeping new reclamation projects in abeyance. Restrictions on immigration were approved. The advisability of giving the President power in time of war to draft material resources, services, and essential commodities was advanced. The proposed Federal anti-lynching law was commended and efforts to shift State and local duties to the Federal Government were condemned.

Candidates. The name of Herbert Hoover was placed in nomination before the convention by Frank L. McNab of California, June 14. After other nominations had been made, a ballot was taken. It gave 837 votes for Hoover, who was thus nominated on the first ballot. Lowden obtained 74 votes, Curtis 64, Senator Watson of Indiana 45, Goff 18, Norris 24, Coolidge 17, Dawes 4, and Hughes 1. In all, 1084 votes were cast. Senator Charles Curtis of Kansas was chosen candidate for Vice President June 16. He was nominated on the first ballot, receiving 1052 votes. The remaining votes were: for Dawes, 13; Ekern, 19; MacNider, 2.

Democratic Convention. The National Convention of the Democratic party convened June 27, at Houston, Texas, in a hall specially built for the purpose. Its session was almost as brief and direct in its proceedings as the Republicans'. Claude G. Bowers, an editorial writer on the New York World, delivered the keynote address, which arraigned Republican rule in sensational terms on charges of corruption and of favoring moneyed interests.

Democratic Platform. The chief contest over the drafting of the party platform had to do with the stand to be taken on enforcement of Prohibition. It was settled by the adoption of a compromise plank, suggested by Senator Glass of Virginia, acceptable to both Wets and Drys. The platform reaffirmed devotion to Jeffersonian principles and the spirit of Woodrow Wilson and

held it the function of government to preserve equal opportunity, "so that all may share in our priceless treasures." States' rights, it was declared, should necessarily be preserved. Republican administration was condemned as leaving "agriculture prostrate, industry depressed, American shipping destroyed, workmen without employment . . . corruption unpunished." The "treasonable crimes" of cabinet ministers and the "purchase of seats" in the Senate were alleged. The party was pledged to businesslike reorganization of the Department, to eliminating duplication therein and to modernizing administrative methods. Reduction effected in expenditure under Republican rule was ascribed to the elimination of war expenditures. Democrats in Congress were represented as having sought tax reduction and Republicans as having delayed it. Further reduction was favored "of the internal taxes of the people."

A tariff programme was set forth; it proposed that the Nation's tariff policy should maintain "legitimate business and a high standard of wages," increase purchasing power by reducing monopolistic and extortionate rates, restore to its original conception the fact-finding Tariff Commission, and impose duties to "permit effective competition" and "insure against monopoly." Preservation of the Civil Service was promised. Agriculture and stock raising were represented as victims of Republicans' "unsympathetic inaction." The Republican party was said not to have redeemed its pledge of 1924 to restore equality with other industries to agriculture. Republican policy was condemned as offering the farmers only crop reduction and "continued deflation." There was declared a need of legislation "for the control and orderly handling of agricultural surpluses." The mining industry was stated to have "suffered like agriculture and from similar causes," and it was declared necessary to "remove the restrictions that destroy its prosperity."

The need of "a constructive foreign policy" was represented, and as principles of such a policy there were offered outlawry of war, "abhorrence of militarism, conquest, and imperialism," non-interference with Latin-American elections, restoration of American leadership in the movement for international understanding, "full and free coöperation" with other nations to promote peace, and termination of the practice of making executive agreements to maintain any foreign government against revolution, save as ratified by the Senate. The Naval Limitation agreement of 1921 was condemned as having "simply resulted in the destruction of our battleships." The party undertook to promote deep waterways from the Great Lakes to the Gulf and the Atlantic. Flood-control work on the Mississippi was endorsed, as were "such reclamation and irrigation projects on the Colorado River as may be found feasible." Stricter enforcement of the Federal Water Power Act was suggested. A national policy of reforestation was proposed. The Federal Road Law was endorsed. The party was represented as favoring collective labor bargaining, the exemption of labor from anti-trust laws, and plans to restrict the issue of injunctions against labor groups. Unemployment, found to be "widespread and increasing," was held to justify public appropriations for necessary construction, to be made while unemployment prevailed, "A living wage" and accident compensation for government employees were advocated. HERBERT HOOVER

ELECTED PRESIDENT OF THE UNITED STATES, 1928

aid to veterans was pledged. The platform favored "equal wage for equal service" for women. Immigrant limitation was declared necessary, but the separation of families condemned. Government control of radio in contravention of the right of free speech was disapproved. "Constructive legislation" to correct demoralization in the bituminous coal industry was proposed. The party favored fixing the date for convening Congress "immediately after the biennial National election." The pledge of enforcement of prohibition was as follows:

Speaking for the national Democracy, this convention pledges the party and its nominees to an honest effort to enforce the Eighteenth amendment and all other provisions of the Federal Constitution and all laws enacted pursuant thereto.

A pledge of monthly financial statements from the party during the campaign was made. It was asserted that the Government should continue to operate ship lines that could not be transferred to private enterprise. Efforts were demanded on behalf of the Armenian people. The country was described as "becoming controlled by trusts and sinister monopolies," so as to require the strict enforcement of the anti-trust laws and possible further enactments. It was declared "our liberty and our duty" to grant immediate independence to the Philippines. Enlargement of the Bureau of Public Health was pledged.

Candidates. The Houston convention nominated Governor Alfred E. Smith of New York as the party's candidate for President June 28 on the first ballot. Franklin D. Roosevelt of New York made the nominating speech. Twelve other names were placed in nomination. The single ballot taken gave Smith 724 $\frac{2}{3}$ votes; Reed of Missouri, 48; George of Georgia, 52 $\frac{1}{2}$; Hull of Tennessee, 71 $\frac{1}{2}$; scattering, 203. Smith's vote fell short of the necessary two-thirds prescribed by the party rule. Accordingly the Ohio delegation, which had voted almost solidly for Pomerene of Ohio, shifted its entire vote to Smith before the ballot was declared ended. Several other delegations thereupon swung largely or wholly to the Smith column. The ballot as thus altered gave Smith 849 $\frac{2}{3}$. Senator Joseph T. Robinson of Arkansas was selected as candidate for Vice President June 29 on the first ballot.

THE HOOVER CAMPAIGN. Secretary Hoover left his duties at Washington July 14 and proceeded to Palo Alto, California. He there received formal notification of his nomination at a gathering in the Stanford Bowl, August 11. In his speech of acceptance, he pictured the material progress and condition of the country, citing statistical data as showing its general prosperity. He spoke of the abolition of poverty as "one of the oldest and perhaps the noblest of human ambitions," and declared America nearer the fulfillment of this ambition than any country had ever come before. The problem of agricultural depression, he asserted, must be solved, and he pronounced "an adequate tariff the foundation of farm relief." He recommended inland waterways as bound to raise the farm price of export products and cited the Republican pledge to reorganize the farm marketing system and create a Federal Farm Board with resources to build up farmer-controlled stabilization corporations. He accepted fully the Republican tariff principles and, save for the new quota basis, the immigration laws. He proposed repealing the provision for a new

quota basis. He praised American labor for "our freedom from foreign social and economic diseases." The time had arrived, he said, "when we must undertake a larger-visioned development of our water resources." Projects of various sorts that he had in mind would, he said, require the expenditure of over \$1,000,000,000 in the next four years. As to prohibition, he repeated an earlier statement, as follows:

I do not favor the repeal of the Eighteenth Amendment. I stand for the efficient enforcement of the laws enacted thereunder. Whoever is chosen President has under his oath the solemn duty to pursue this course.

Our country has deliberately undertaken a great social and economic experiment, noble in motive and far-reaching in purpose. It must be worked out constructively.

He recommended the close coöperation of government and business and defended large business, saying: "Our people know that the production and distribution of goods on a large scale is not wrong." He condemned corruption "participated in by individual officials and members of both parties," and characterized dishonesty in government as treason to the State. He promised a foreign policy directed primarily toward peace.

Mr. Hoover delivered, in all, seven major addresses in the course of the campaign, to his opponent's sixteen. The seven were broadcast by a chain of radio stations transmitting them to all parts of the country. At Los Angeles on August 17, he treated the Boulder Dam proposal as involving the welfare of all the people in the Colorado Basin States, and as a problem that must be solved in the interest of all of them. His address was interpreted in California as favorable to California interests. In Newark, N. J., September 17, he represented the tariff and immigration policies as beneficial to labor. He attacked Democratic tariff policy in Boston on October 15. In New York on October 22, he condemned Governor Smith's proposed course on Prohibition, farm relief, and hydro-electric development as State socialism. In a published statement of October 27, he met the outcry of agricultural malcontents by declaring that he would call a special session of Congress upon his inauguration, to make enactments for farm relief. At St. Louis, November 2, he expressed the intention of his party to create a Federal Farm Board with "power to determine the facts, the causes, the remedies" relating to the farm problem.

GOVERNOR SMITH'S CAMPAIGN. Governor Smith received at Albany, August 31, formal notification of his nomination by the Democratic party. He had previously, upon his nomination, issued a statement setting forth his personal views in opposition to Prohibition. In his formal address of acceptance he said: "The Democratic party asks the electorate to withdraw their confidence from the Republican party," and called the latter "responsible for the widespread dishonesty that has honeycombed its administration." He qualified prosperity under the Coolidge administration as unreal. He alleged an increase both in the appropriations and in the actual expenditures of the Government, and promised, if elected, to "effect a real reorganization and consolidation of governmental activities upon a business basis." He denied intention in his party to produce a tariff upheaval, and indicated that if elected he would seek to restore the Tariff Commission to its original scope. He proposed improv-

ing relations with the Latin-American republics, and promised "a more substantial endeavor to remove the causes of war" in the international field.

Governor Smith pledged with emphasis an honest effort to enforce the Eighteenth Amendment and the attendant laws. He declared that while the party platform was silent on the subject, he personally believed that there should be a change as to prohibition, and that he would advise Congress thereon if he became President. He recommended allowing each State to fix its own definition of the permissible alcoholic content of drink, within a maximum fixed by Congress, as a matter of immediate relief, and further, an alteration of the Eighteenth Amendment to enable each State, after a referendum, to sanction the manufacture, import, and sale of alcoholic beverages if it chose. The dry States, he proposed, should continue to enjoy the benefit of a National law enforcing Prohibition within their borders; and the saloon was not in any case to be restored.

As to agricultural distress, he pointed out the two vetoes of the McNary-Haugen Bill and asserted the failure of the President to offer any constructive alternative. He undertook, if elected, immediately to ask agricultural leaders, economists, and others to work out the details of legislation to solve the problem of farm-product distribution. He neither endorsed nor rejected the idea of an equalization fee, contained in the McNary-Haugen Bill. Power resources belonging to the Nation, he declared, should be prevented from passing into private hands by lease, but public authority "must control the switch that turns on or off the power." For the development of the Colorado River, he proposed setting up a Colorado River Authority, representing equally the States concerned. He advocated remedy of abuses of the employment of the court injunction against labor, and proposed maintaining immigration restriction but mitigating harsh methods.

Speaking Tours. Governor Smith made several extended speaking tours. Starting in mid-September, he invaded the agricultural West. In Omaha, September 18, he opened his campaign with a presentation of his farm-relief programme to the farmers. He declared himself to be in favor of the principle aimed at in the McNary-Haugen Bill, but not to be limited by the methods that it provided. By this time the so-called "whispering campaign," a private agitation against Governor Smith on the score of his Catholic faith, a subject of public opposition on the part of only a few individuals, such as Senator Heflin of Alabama, had become extremely alarming to the Democratic campaigners. At Oklahoma City, September 20, Governor Smith accordingly dealt at length and frankly with the "whispering campaign" and the anti-Catholic elements supposedly back of it. He denounced attacks on Tammany, his own parent political organization, as a "red herring" drawn across the trail by religious bigots. He declared his opponents in the Ku Klux Klan "totally ignorant of the history and tradition of this country." In Denver, September 22, he made the proper safeguarding of the Nation's hydro-electric resources his theme, and restated his ideas as to the Colorado River and Boulder Dam; he spoke at Butte, Mont., and at St. Paul. Returning to his own State, he addressed the Democratic State Convention October

1, at Rochester, on State issues, party responsibility, and water power.

In the middle of October, Governor Smith set out again for the border States of Tennessee and Kentucky. An effort was by this time necessary to hold Southern Democratic sentiment in line, on account of growing defection among Southern Drys and religious partisans, and the Governor's train was taken through Virginia and North Carolina, where numerous stops but no speeches were made. In Nashville, October 12, Governor Smith taxed Mr. Hoover with vagueness and challenged him to treat the Smith position on the issues. After speaking at Louisville on October 13, he entered Missouri and delivered one of the most vigorous addresses of the campaign at Sedalia, Mo., October 16. In this address he attacked the record of the Republican administration for economies, charging that the annual cost of operating the Federal departments had risen by \$200,000,000 between 1924 and 1927. This assertion was promptly controverted by Secretary of the Treasury Mellon in a published statement. The final Smith tour began with a speech in Philadelphia, October 27, in which the candidate assailed alleged inconsistencies in Mr. Hoover's record on Prohibition and criticized the existing state of Prohibition enforcement.

In Baltimore, October 29, the Governor again sought to counteract Klan antagonism, and criticized the conduct of foreign relations, a matter with which it had been widely bruited by Republicans that he was not conversant. On October 30, he spoke in Newark, again taxing Mr. Hoover with avoiding debate, and asserting that Charles E. Hughes, who had been actively speaking on the Republican side, ought logically to be the Republican candidate. He spoke in Brooklyn, November 2, on State issues, and in New York twice on November 3; one of the two addresses, over the radio, was directed at the Western farmers, while the other, before a New York audience, was a summing up of his chief campaign contentions.

Antagonists of Governor Smith. The candidacy of Governor Smith was exceptional in the amount of antagonism that it called out beyond the active circles of the Republican organization. The Democratic Senator Heflin of Alabama was the most radical of his opponents within the Democratic group. Senator Simmons of North Carolina, a strong advocate of Prohibition, was immovably opposed. Ex-Senator Owen of Oklahoma, another Democrat, followed prevailing sentiment in his State by refusing to support Governor Smith. He alleged the candidate's Tammany affiliation as the reason; Governor Smith rejoined that in 1924 the Senator had courted Tammany support for Owen as a possible compromise presidential candidate at the New York convention. William Allen White, editor of the *Emporia Gazette*, issued in July an attack on Governor Smith, in which were enumerated a series of votes in the New York Legislature, recording Smith, then a member of that body, as in favor of saloons and tolerant of commercialized vice. White withdrew of his own motion the charges of the latter description. Governor Smith issued August 20 a statement explaining his vote case by case, as affecting saloons. Many leading Democrats expressed themselves as opposed to Governor Smith's personal views on Prohibition but nevertheless supporting him as the party candidate. Party loyalty in some Democratic States was

ALFRED E. SMITH
GOVERNOR OF THE STATE OF NEW YORK
DEMOCRATIC CANDIDATE FOR PRESIDENT, 1928

much attenuated by antagonism to the candidate on religious and Prohibition grounds and by the activities of the Ku Klux Klan and other agencies. Senator Norris of Nebraska on the other hand bolted the Republican ticket.

THE VOTE. The election, held November 6, brought out a very large popular vote, so distributed that although Governor Smith polled more ballots than any previous Democratic candidate for the Presidency, Mr. Hoover, outrunning him by over six million popular votes, at the same time gained the electoral votes of 40 of the 48 States.

Popular Vote. According to the figures compiled by the Associated Press, the vote cast for Hoover and Curtis was 21,429,109; that for Smith and Robinson, 15,005,497; and the resulting plurality for Hoover and Curtis, 6,423,612. The total vote cast exceeded that of the National election of 1924 by about 6,600,000. Although greatly outdistanced, Governor Smith obtained only about a million votes less than the total cast for Coolidge in 1924. He lost heavily in some of the Southern and border States, as compared with the Davis vote in 1924, and greatly outran Davis in most of the populous Eastern and North Central States, including New York, Pennsylvania, and Illinois, which, however, he did not carry.

The popular vote cast for presidential electors, tabulated by States under the names of the presidential candidates of the more important parties, as published by the Associated Press on December 21, was as follows:

State	Hoover, Rep.	Smith, Dem.	Thomas, Soc.	Foster, Workers	Reynolds, Soc. Lab.	Pluralities Hoover	Smith
Alabama	120,725	127,796	460	7,071

SMITH			
Alabama	12	Mississippi	10
Arkansas	9	Rhode Island	5
Georgia	14	South Carolina	9
Louisiana	10		
Massachusetts	18	Total	87

Among the States in the Democratic column were two that had been Republican in the two previous presidential elections. These were Massachusetts and Rhode Island. In both lived a large number of citizens of Governor Smith's own

faith and both States had suffered considerably in 1926 and 1927 from the depressed condition of the New England cotton textile mills. The defection of Southern States that had ranked for over a generation as invariably Democratic was a striking feature of the outcome. Virginia, North Carolina, Florida, and Texas gave the Republican candidates in all 50 electoral votes that had been regarded as traditionally Democratic. In Florida, the result was attributable in part to the influx of citizens from the Northern States. In the other three, as in Oklahoma, Tennessee and Kentucky, it was ascribed largely to antagonism toward Governor Smith himself, based on his political and religious beliefs.

Congress. The vote for United States Senators in the several States resulted in a large Republican gain, due in part to the coincidence that the seats filled in 1928 had been chiefly held by Democrats. A majority of thirteen Republicans in the Senate of the Seventy-first Congress was assured. The Republicans obtained a majority of at least 87 in the House. Senators were elected in 34 States (counting Maine which elected on September 10). Nine Republican senators, 11 Democratic, and 1 Farmer-Labor Senator were reelected. Three Republicans and one Democrat, elected to serve after Mar. 4, 1929, replaced senators of their own parties. Six Senate seats held by Democrats (in Delaware, Maryland, Michigan, Missouri, New Jersey, and Rhode Island) were gained by Republicans.

UNITED STATES MILITARY ACADEMY. A government institution at West Point, N. Y., for the theoretical and practical training of cadets for the military service of the United States; opened in 1802. On Sept. 1, 1928, the total number of cadets was 1272, distributed as follows: First class, 302; second class, 253; third class, 318; fourth class, 399. There were 215 members on the faculty. The Academy is a component part of the Regular Army of the United States and is maintained solely by appropriations from the War Department, which in 1928 amounted to \$2,246,587 for salaries and maintenance of public works, and to \$861,000 for continuing construction. The library contained 108,000 volumes. Superintendent, Wm. R. Smith, Major General, U. S. Army.

UNITED STATES NAVAL ACADEMY. A school for the education and training of midshipmen, at Annapolis, Md., founded in 1845. The total number of midshipmen at the beginning of the academic year 1928-29 was 1790, distributed as follows: First class, 248; second class, 427; third class, 509; and fourth class, 606. The faculty numbered 245. The library contained 70,000 volumes. Midshipmen, after graduation, are commissioned as ensigns in the United States Navy, and occasionally to fill vacancies in the Marine Corps and in certain staff corps of the Navy. Superintendent, Rear Admiral S. S. Robinson, United States Navy.

UNIVERSALISTS. A religious denomination existing chiefly in the United States, Canada, and Japan. It holds as parts of its doctrine the universal fatherhood of God and the final harmony of all souls with God. Its churches are grouped in 28 State Conventions and 2 State Conferences. A General Convention, held biennially, met in 1927 in Hartford, Connecticut. A report on church unity, adopted by the convention, was significant in that it emphasized that the basis of Christian unity is to be found not

in a common creed or similar practices of various churches, but in the recognition that Christianity is primarily a way of life. Resolutions adopted put the Convention on record as favoring the abolition of capital punishment and also as favoring the outlawry and abolition of war, either offensive or defensive. During the year, the Convention also commenced the construction of a Universalist National Memorial Church in Washington, D. C., and put into operation a ministers' pension plan.

The number of churches in 1928 was 613; ministers in fellowship, including lay licenses, 562; communicants and adherents, 85,056; and Sunday schools, 405. The denominational periodical, the *Christian Leader*, is published weekly. Headquarters of the denomination are at 176 Newbury Street, Boston, Mass. The Rev. Frank D. Adams, D.D., of Detroit, Michigan, was president of the General Convention in 1928.

UNIVERSE, STRUCTURE OF. See ASTRONOMY.

UNIVERSITIES AND COLLEGES. STATISTICS. The United States Bureau of Education published the statistics of universities, colleges, and professional schools for the college year 1925-26. The report deals with 975 different institutions. Of these, 154 were under public control and 821 under private control. There was a total of 156 independent professional schools. If these independent institutions are combined with the departments of universities, there were 180 schools of theology, 136 schools of law, 77 schools of medicine, 43 schools of dentistry, 67 schools of pharmacy, 5 schools of osteopathy, and 12 schools of veterinary medicine.

ENROLLMENT. The total number of students enrolled in the 975 institutions reporting to the Bureau of Education was 822,895, of which number 507,732 were men and 313,163 were women. These totals included 33,185 men and 22,447 women in preparatory departments. There were 20,159 men and 12,341 women in graduate departments; 92,591 men and 5,822 women in professional departments; and 23,211 men and 30,355 women registered as unclassified and special students. Schools of theology enrolled 13,655 students; schools of law 40,359; schools of medicine 19,682; schools of dentistry 11,777; schools of pharmacy 10,815; schools of osteopathy 1588, and schools of veterinary medicine, 537. A total of 59,315 students was enrolled in schools of engineering. These institutions enrolled 209,454 students in summer schools, 3772 in winter short courses, and 268,481 in extension and correspondence courses.

The institutions under public control enrolled a total of 290,893 students, while those under private control enrolled a total of 532,002 students.

Excluding those enrolled in summer schools, short courses, extension and correspondence courses in the four largest institutions under public control the numbers of students were: University of California, 18,969; University of Minnesota, 13,225; University of Michigan, 10,134; and the University of Illinois, 10,073. The four largest institutions under private control were: New York University, 20,383 students; University of Chicago, 14,472 students; Columbia, 12,527 students; and the University of Pittsburgh, 12,052 students. The four largest women's colleges were: Hunter College, 4401; Smith College, 2158; Wellesley College, 1599; and Simmons College, 1531 students. The Carnegie Institute of Technology had an enrollment of 2899; the Mas-

sachusetts Institute of Technology, 2813; and the Rensselaer Polytechnic Institute, 1251.

The average annual increase in the number of strictly college students for the six years ending in 1926 was 50,786. Between 1910 and 1920, the average annual increase was 19,600 students. From 1900 to 1910, it was 9900 students, while from 1890 to 1900, it was approximately 4600. Enrollments in the graduate departments increased 47 per cent from 1920 to 1922; 25 per cent from 1922 to 1924, and 13 per cent from 1924 to 1926.

PROFESSORS AND INSTRUCTORS. The total number of professors and instructors in the 75 institutions reporting was 62,224, of which number 48,649 were men and 13,575 were women. The 154 institutions under public control employed a total of 20,890 professors and instructors. Of these 16,815 were men and 4,075 were women. The institutions under private control employed 41,334. Of these 31,834 were men and 9500 were women. The percentage of increase in faculty members was not as large as the percentage of increase of students. In 1926 the ratio of students to professors was 13.2; in 1924 it was 12.9; in 1922, 12.4; and in 1920, 12.2.

DEGREES. During the college year 1925-26, the universities and colleges conferred a total of 71,529 baccalaureate degrees. Of these 41,106 were earned by men and 30,423, by women. A total of 11,451 graduate degrees were conferred. Of these, 1302 were Ph.D. degrees. The Ph.D. degrees were conferred upon 1115 men and 187 women. A total of 1214 honorary degrees were conferred. Of these 397 were the degree of D.D.; 374, LL.D.; 74 Litt.D.; while only three were for the Ph.D. Schools of law conferred 7938 first professional degrees; schools of medicine, 4122; schools of pharmacy, 3492; schools of dentistry, 2666; schools of theology, 1357; schools of osteopathy, 393; and schools of veterinary medicine, 123.

INCOME. The total income reported by the 975 institutions was \$479,774,664. This included \$72,374,608 received for endowment. The source of the income was as follows; student fees, \$101,499,120; room rent and board, \$42,346,824; productive funds, \$49,748,999; appropriations from city or State for increase of plant, \$18,355,836; appropriations by State or city for current expenses, \$81,522,432; United States Government, \$16,144,147; private benefactions for increase of plant, \$29,473,324; private benefactions for current expenses, \$16,396,853; all other sources, \$51,912,421. Excluding additions to endowments, student fees were 24.9 per cent of all college and university receipts for the year.

PROPERTY. In 1926 the total property belonging to these 975 institutions was valued at \$2,334,307,221. The value of grounds was \$225,721,958; buildings, \$911,498,850; libraries, apparatus, furniture, and other equipment, \$219,083,684; productive funds, \$978,012,929.

GIFTS AND BENEFACCTIONS. During the year 1928, many gifts for educational purposes were announced. The magnitude of individual gifts was not as great as that which characterized some of the benefactions in previous years. Among the gifts of one hundred thousand dollars or more, the following have been announced: Mr. and Mrs. Charles Ward Seabury gave \$150,000 to Berea College for a gymnasium. Bowdoin College received a bequest of \$250,000 from the late Frank A. Munsey, \$100,000 from Thomas Upham

Coe, and \$100,000 from F. G. Tallman to establish the Tallman Lecture Fund which will be used to bring visiting lecturers to the college, preferably from abroad.

Brookings Institution received a conditional gift of \$2,000,000 from the Laura Spelman Rockefeller Memorial. The University of Buffalo received a gift of \$100,000 from Darwin D. Martin to establish the Martin Professorship of Mathematics. The University of California received \$1,500,000 from A. P. Giannini. One-third of the gift was for construction of a building and the remainder for endowment. Mr. and Mrs. C. N. Flint gave a trust fund of \$120,000 to the University of California, Southern Branch. The university also received a gift of \$265,000 in memory of Col. Seelye W. Mudd, \$200,000 from Edward L. Doheny, Jr., and \$350,000 from Mrs. Philip E. Bowles for a men's dormitory.

The University of Chicago received \$120,000 from Robert Law, Jr. toward the fund to endow a distinguished service professorship; \$300,000 from the estate of Adolph J. Leihstern; \$400,000 from B. E. Sunny to be used to erect a gymnasium for elementary and high schools of the university; \$1,000,000 from the Carnegie Foundation for the New Graduate Library School; \$100,000 from Max Epstein to establish a Lying-in Hospital; a gift from Julius Rosenwald which may reach \$2,000,000; a gift of \$1,000,000 from Mr. and Mrs. Albert D. Lasker for the study of diseases of men and women of middle age; \$250,000 from Julius Rosenwald for research in physics, mathematics, and astronomy; and \$1,000,000 from the Laura Spellman Rockefeller Memorial to be used in teaching religion. Sereno P. Fenn gave \$100,000 to the Cleveland Y. M. C. A. School of Technology for a new building. Colorado College received \$250,000 for a chapel from Eugene P. Stone.

Columbia University received \$116,666 from F. W. Vanderbilt, \$250,000 from Mrs. Nathan J. Miller to endow a chair of Jewish culture, and \$1,000,000 by the will of Mrs. John Innes Kane. Cornell University received \$2,823,657 from the late Payne Whitney for its medical college, \$1,650,000 from an anonymous donor for the erection of residence halls, \$144,000 from Harrison D. McFaddin for a men's dormitory, \$1,500,000 from M. C. Taylor, and the General Education Board promised the University \$1,416,666.

The Cranbrook Foundation received \$6,500,000 from George C. Booth. The Croton Preparation School received \$1,129,222 from the estate of Payne Whitney. Dartmouth College received \$200,000 by the will of Captain Thomas P. Salter; \$300,000 from Frank P. Carpenter for a fine arts building; \$1,500,000 from the estate of the late Edwin Webster Sanborn, approximately \$400,000 of which is to be used for the construction and furnishing of an English house; and \$100,000 from Mrs. William Pierce Johnson. Dartmouth College also received a provisional gift of \$750,000 from the General Education Board, and the same amount from an anonymous donor, also \$1,158,000 from the estate of F. Augustus Schermerhorn.

Drew University received an endowment of \$1,000,000 and \$500,000 for buildings from Leonard D. and Arthur J. Baldwin. Mr. and Mrs. Thomas J. Maloney gave \$250,000 to Georgetown University for the Chemo-Medical Research Institute. Johns Hopkins University received an anonymous gift of \$100,000, \$155,000 and half of

residue of estate of Mrs. Rebecca Lanier King, and \$195,000 from the Chemical Foundation to the School of Public Health for the study of "the origin, nature, and possible cure of the common cold."

Harvard University announced the following: \$180,000 by the will of the late Archibald Cary Coolidge; \$627,347, residue of the estate of Curry Lowell; an anonymous gift of \$3,000,000 to build and endow a "House" or group of dormitories; \$2,000,000 from the estate of Charles M. Hall; and a conditional gift of \$3,000,000 from the General Education Board. The Hebrew Union College received a conditional gift of \$500,000 from Julius Rosenwald. Kalamazoo College received a bequest of \$350,000 for a library by the will of the late Mary Senter Mandelle. The Carnegie Foundation granted \$1,000,000 to the University of Michigan for the development of fine arts. Oberlin College received \$100,000 from Andrew H. Noah for a residence hall for men. J. T. Lupton gave \$250,000 to Oglethorpe University.

Phillips Exeter Academy received \$613,000 from William Boyce Thompson and \$320,000 from Edward Harkness. Rutgers University received \$140,000 from the estate of Mary B. Pell. St. Xavier College received \$150,000 for the extension of its campus. An anonymous donor gave Scripps College \$250,000 for building and furnishing a recitation hall. Sweet Briar College received \$185,000 from an unnamed member of the directors of the institution for the erection of a library. Edward Harkness gave \$500,000 to the Taft School toward a \$2,000,000 endowment. The University of Tennessee received \$250,000 by the will of the late Martha A. Henderson for the erection of a girls' dormitory.

Cyrus H. K. Curtis, the publisher, made a gift of \$500,000 to Temple University. The General Education Board gave \$135,000 to the University of Texas to be used by the department of zoölogy in the development of graduate instruction and research during the next eight years. Union University received \$250,000 from Edward Harkness for the Albany Medical School. A sum of about \$150,000, the residuary estate of Miss Evelyn Colgate, was to be divided between Colgate University and Vassar College. Washington University received \$630,000, the residue of the estate of the late George Warren Brown.

The University of Washington received \$290,000 from the Daniel Guggenheim Fund for the Promotion of Aeronautics; and \$360,000 from Mrs. Newton R. Wilson to be used for a new building for Mary Institute. Wesleyan University received endowment from "six friends of the university" to the extent of \$600,000; also \$100,000 each from John E. Andrews, George W. Davidson, George S. Ingraham, Albert W. Johnston, and Henry I. Harriman. Mrs. Stephen Henry Olin gave Wesleyan University \$100,000 for the upkeep of the new library. The following gifts were announced by Yale University: \$1,000,000 by the will of the late Chauncey M. Depew; \$1,000,000 from Abram E. Fickern for the study of children's diseases and child life; books valued at more than \$400,000; and \$2,823,657 from the late Payne Whitney.

NEW PRESIDENTS. During the year, the following new presidents of universities, colleges, and technological schools were reported: Dr. Bradford Knapp was elected president of Alabama

Polytechnic Institute. Dr. Robert Devore Leigh was elected president of the New Woman's College, located at Bennington, Vermont. The Rev. Dr. Walter B. Greenway was elected president of Beaver College. Ira N. Chiles was elected president of Central Wesleyan College. Dr. Joseph Eugene Rowe was chosen president of the Clarkson Memorial Institute of Technology. Dr. Earl A. Roadman was installed as president of Dakota Wesleyan University. Dr. Franklin W. Johnson was elected president of Colby College. Dr. Frederick M. Hunter was elected president of the University of Denver. Dr. Garfield B. Oxnam was elected president of De Pauw University. Dr. H. L. Donavan was elected president of Eastern Kentucky State Teachers' College. The Rev. W. Coleman Nebils was elected president of Georgetown University. The Rev. Dr. C. R. Myers was elected president of Hartwick College. Dr. James M. Kieran was elected president of Hunter College. Royal C. Agne was elected president of Huron College. Dr. F. J. Kelley was elected president of the University of Idaho. Dr. Ray H. Latham was elected president of Iowa State Teachers College. Dr. James E. Coons was elected president of Iowa Wesleyan College. The Rev. Brother Albert was elected president of La Salle College. The Rev. William M. Magee, S.J., was elected president of Marquette University. The Rev. John Timothy Stone was elected president of McCormick Theological Seminary. Dr. Spright Dowell was elected president of Mercer University.

Dr. Alfred H. Upham was elected president of Miami University. The Rev. Dr. W. N. Schwarze was elected president of Moravian College and Theological Seminary. Dr. Edgar Albert Burnett was elected chancellor of the University of Nebraska. Dr. Charles L. O'Donnell was elected president of the University of Notre Dame. Dr. H. G. Bennett was elected president of Oklahoma Agricultural and Mechanical College. Dr. Edmund D. Soper was elected president of Ohio Wesleyan University. Dr. G. I. Christie was elected president of Ontario Agricultural College.

Dr. Charles K. Edmunds was elected president of Pomona College. Dr. James L. Meader was elected president of Russell Sage College. Dr. Ezra T. Franklin was elected president of Southwestern College. Dr. Harvey N. Davis was elected president of Stevens Institute. Dr. Frank Parker Day was elected president of Union College. Rear Admiral Samuel S. Robison was appointed as superintendent of the U. S. Naval Academy. Dr. Francis P. Gaines was elected president of Wake Forest College. Austin H. Fitts was elected president of the University of West Virginia. B. O. Skinner was elected president of Wilmington College.

EDUCATIONAL BOARDS AND FOUNDATIONS.—**GENERAL EDUCATION BOARD.** The General Education Board was founded in 1902. Its assets June 30, 1927, were reported as \$98,353,706.23. The receipts during the year ending June 30, 1927, were \$19,664,854.24. This included a balance on June 30, 1926, of \$13,336,767.61. The disbursement for the year from income was \$5,460,271.60, leaving a balance on June 30, 1927, of \$14,204,582.64. From the date of the Board's foundation, in 1902, to June 30, 1927, there had been appropriated from principal funds a total of \$82,182,118.96; and from income, \$77,783,703.01, making a total of \$159,965,821.97. Of the amounts appropriated, \$111,549,540.39 had been paid, leaving unpaid a total of \$48,416,281.58. In addition to the above

payments, \$195,691.81 had been appropriated and paid from the income of the Anna T. Jeanes Fund to rural schools for Negroes.

LAURA SPELMAN ROCKEFELLER MEMORIAL. The report of the treasurer for the year ending Dec. 31, 1928, shows assets amounting to \$85,386,931.87. This was made up of a principal fund amounting to \$73,089,522.85, and income accounts totaling \$12,279,409.02. The income for the year was \$9,311,820.72. This included a total of \$4,996,564.27 made up of a balance from the preceding year and refunds on prior year payments. The disbursements were for payments on appropriations, \$3,250,106.29; administration, \$196,898.61, making a total of \$3,447,004.90, and leaving a balance of \$5,864,815.82. During the year, the memorial appropriated \$1,641,649.20 for research and work in the field of child study and parental education; and a total of \$854,600 to organizations in the general field of social welfare.

CARNEGIE FOUNDATION FOR THE ADVANCEMENT OF TEACHING. The total resources of this Foundation are reported as \$30,857,000, of which \$15,647,000 is held as permanent general endowment, \$1,351,000 as endowment of the Division of Educational Enquiry, \$12,428,000 as a reserve for liquidating pension liabilities accruing after 1928, \$830,000 to assist colleges and universities to adopt the contributory plan of annuities, and \$601,000 as an emergency reserve. During the twenty-two years of its activity, the Foundation has paid out in retiring allowances to professors and pensions to their widows over \$15,985,000. During the year ending June 30, 1927, the total expenditure from general funds was \$1,403,188.42. Of this sum \$1,314,419.92 was for retiring allowances. The expenditure for the Division of Educational Enquiry was \$73,394.96; of this sum, \$22,806.77 was used for a study of college athletics.

The Teachers Insurance and Annuity Association of America, which was organized by the Carnegie Foundation and financed by the Carnegie Corporation, reported that deferred annuity contracts provided by the Association had been adopted by 176 institutions. Teachers in 400 other institutions had taken contracts in the Association. The number of annuity contracts in force at the end of 1926 was reported as 4542, representing a total annual annuity of \$7,151,070. There was a total of 3715 insurance policies amounting to \$20,448,651. The premium income for 1926 was \$1,982,547. The Association had resources of \$9,092,558. See **CARNEGIE CORPORATION**; **CARNEGIE FOUNDATION**.

THE CARNEGIE CORPORATION. The report for the year ending Sept. 30, 1928, shows that the Corporation has total funds amounting to \$128,691,443.59. The total income for the year was \$7,103,279.58. The donations paid during the year amounted to \$5,923,689.25. This included \$50,000 for buildings, \$279,734.67 for library and other buildings for institutions, and \$3,346,666.68 for endowments. The total charges against future income were \$21,418,581.84. The Corporation also had a special fund the income of which is to be used in Canada and the British Colonies. The total amount of this fund was \$13,862,088.90. The income for the year ending Sept. 30, 1928, was \$679,873.16. Donations amounting to \$209,528.15 were paid. Of this amount, \$25,000 was given to the Royal Society of Canada. Of the remainder, a considerable por-

tion was given to the furtherance of an African programme. See **CARNEGIE CORPORATION**.

THE COMMONWEALTH FUND. For the year closing Sept. 30, 1927, the Fund reported assets amounting to \$39,371,091.97. The income for the year was \$2,444,579.64. The expenses totaled \$1,938,564.04. The fund was concerned with child welfare. A child-health programme was inaugurated with the organization of child-health demonstrations in Fargo, N. Dak.; in Clark County, Ga.; in Rutherford County, Tenn.; and in Marion County, Oreg. Each was planned to require seven years for its completion. The emphasis of the demonstration is on preserving and building up the health of the "so-called normal child." A second activity of the fund was in connection with mental hygiene and child guidance. The work that the fund had undertaken as a "programme on methods of preventing delinquency in the bureau of children's guidance" was replaced by an institute for child guidance.

ROCKEFELLER FOUNDATION. The Rockefeller Foundation was incorporated in 1913. The secretary's report for the year ending Dec. 31, 1927, showed assets consisting of a principal fund amounting to \$162,291,624; land, buildings, and equipment, \$9,344,666; income accounts, \$20,546,833.47, making a total of \$192,183,124.09. The income from general fund for the year was \$18,430,550.39. This included a balance from 1926 and refunds of payments made in previous years, totaling \$6,098,647.51. The disbursements for central administration were \$2,569,236.78; international health division, a total of \$3,660,968.22; division of medical education, \$4,992,918.79, making a total of \$11,223,123.79. See **ROCKEFELLER FOUNDATION**.

JOHN SIMON GUGGENHEIM MEMORIAL FELLOWSHIPS. This foundation was established in 1925 with a capital fund of \$3,500,000. It grants fellowships which are "awarded only to young scholars and artists who have given unequivocal evidence of marked gift for research or for creative work and who are engaged in constructive projects requiring special facilities available abroad. Both men and women are eligible. The stipend is usually \$2500 and is awarded for one year. For the year 1928-29 the awards totaled \$173,000 and were given to 75 candidates, 16 of whom were reappointed in order to enable them to complete studies or projects begun during the previous year.

LIMITING COLLEGE ENROLLMENT. Colleges and universities continued to give marked attention to the problem of limiting numbers. An increasing number of institutions had limited either the number that they would receive as freshmen or the number of the student body. The University of Chicago, for example, announced that they would receive only 750 in the freshman class. Lafayette College limited its student body to one thousand. There was a general tendency to increase tuition charges so as to have the student more nearly pay the actual cost of his instruction. Several institutions, including Yale, Harvard, Massachusetts Institute of Technology, Brown, Dartmouth, Williams, Smith, and Wellesley had tuition charges amounting to \$400 per year. Johns Hopkins University had charges of \$450 per year. Other institutions had raised their tuition charges to \$300. In each case the institutions tried to safeguard themselves against the possibility of excluding desirable students. To accomplish this they increased the

amount of loan funds and scholarships. As a result it was easier for a competent, earnest young person to secure a college education than at any previous time in our history. On the other hand, it was asserted that there was a very large number of students who had no serious purpose in attending college, but who went for the social or athletic prestige that the colleges furnish. President Angell of Yale University in a speech before the National Educational Association, Department of Superintendence, made the following statement:

The whole political-educational conception under which we are working is too largely that a college or university education is open at little or no cost to any one of moderate capacity and still more moderate powers of application. There is little or no sense of privilege about it and practically no sense of obligation. Merely to multiply the number of college-trained youths who go back into the community with no vivid feeling of duty to capitalize for the benefit of the commonwealth the training they have received is quite as likely to prove a curse as a blessing for the state.

With colleges and universities crowded and with an increasing number seeking to enter these institutions, it was easy to talk about the limitation of numbers in colleges and universities. Actually to limit numbers was not such a simple matter. The people of the country seem to have supreme confidence in the value of a college education, and, with the prosperity that has existed, parents have chosen to send their children to college. There has seemed no alternative. It has often happened that young people who were in few respects qualified to pursue college work have gained admission. While this may not be a serious matter for the students concerned, it has been a serious matter for the colleges to maintain what they regard as a suitable standard.

More recently, attention has been directed toward making it possible for young people to secure the equivalent of college work during the time they were profitably employed. In places where institutions of higher learning are located, it is possible to find large numbers of young people working in offices and stores who are improving themselves by following courses given during the evening. This is a phase of adult education that bids fair to be important.

During the year, some college administrators have advanced the idea that a great deal could be accomplished by changing methods of instruction within colleges so as to properly care for much larger classes than are now common. Already there was one institution in which there was at least one class that numbered a thousand students. This class met as a unit and apparently results were satisfactory. This plan could not be followed in certain types of laboratory work, but it was claimed that it could be followed in much of the work that is done.

In the past, there has been strong emphasis upon the personal relationship between the professor and the students. It has been assumed that this relationship could exist only when the classes were small. It is true, however, that often the professor in charge of a small class has been no aloof than the one who has had a much larger one. It was urged in some quarters that the methods of teaching and of control be altered so as to conform to the needs that the colleges now face.

LOAN SCHOLARSHIPS OF THE AMERICAN BANKERS ASSOCIATION. A foundation fund of \$500,000 was started in 1925. The trustees proposed to establish 167 collegiate loan scholarships to

stimulate and aid worthy men or women students to pursue courses in banking and economics in selected colleges and universities. The loans are for \$250 for the scholastic year, to be repaid upon the student's entering business life. The general plan announces the allotment of "one scholarship to a higher institution of learning in each State where the banks have completed the subscription quotas assigned them in the foundation fund." Additional scholarships are allowed for each unit of \$2000 or excess fraction of that amount above \$500 contributed from the State. The interest on the loans will be 5 per cent beginning after the student leaves school. Payments may be made in installments of \$10 or more. Students who discharged all their financial obligations connected with this loan were to be given certificates signed by the board of trustees. These certificates might then be used as evidence of financial reliability.

JUNIOR COLLEGES. Since 1917, 15 different States have passed laws dealing with junior colleges. The report of the U. S. Bureau of Education shows that the number of junior colleges in 1926 was 153, located in 31 different States. Of these, 47, enrolling 13,850 students, were under public control, and 106, enrolling 22,660 students, were in private institutions. In general, junior colleges had not been prominent in Eastern States. In the statistics for 1925-26, the only New England State that reported was Massachusetts with 375 students. That same year, New York reported only 127 students. There were none in Pennsylvania, Delaware, or New Jersey. During 1928, however, two noteworthy institutions were opened in New York State.

During 1928, Columbia University organized the Seth Low Junior College as a Brooklyn part of the University. The college was designed to care for the first two years of college work, after which the students might enter Columbia College or some of the professional schools.

The Sarah Lawrence College, a new junior college for girls, opened in October in Bronxville, New York. The aims of the college have been described as follows:

To graduate women in whom interests have been so stimulated that they will continue as an animating principle throughout life. To graduate women whose experience in group activities has shown them the value of cooperative effort, so that they become either fruitful as leaders or skilled in rendering service under the effective leadership of others.

To graduate women who have experienced the value of leisure and whose varied interests insure the profitable use of whatever leisure time shall be theirs.

The college was founded by the late William Van Deuser Lawrence in memory of his wife. It opened with 150 students. It was expected that this number would be increased to 250 as soon as dormitory accommodations could be provided.

TEACHERS' COLLEGES AND NORMAL SCHOOLS. The U. S. Bureau of Education reported that, for the school year 1925-26, there were 402 institutions engaged primarily in teacher training. Of these institutions, 101 were classified as teachers' colleges, 102 as State normal schools, 27 as city normal schools, 108 as county normal schools, and 64 as private normal schools. The report called attention to the remarkable growth of teachers' colleges. In 1920 there were 46 such institutions as contrasted with 101 in 1926. In 1920, 44.4 per cent of the students preparing to teach were in teachers' colleges, whereas in

1926, 62.1 per cent were in such institutions. In 1926 there was a total of 494,290 students enrolled in all teacher-training institutions. In the same year there were about 960,000 teaching positions of all kinds in the United States. There was, therefore, half as many persons preparing to teach as there were teaching positions. In 1894, there was one person in training for every 5.6 positions, while in 1910 there was one for every 5.5 teaching positions. This remarkable increase in the number of those preparing to teach brought with it some serious problems in relationship to the placement of graduates from the various institutions. City normal schools were the first to feel the importance of this problem. It was reported that there were among such schools some which had not been able to place the last two classes that had been graduated.

The total value of all property belonging to normal schools and teachers' colleges reporting was \$202,630,512. Of this, \$19,425,113 represented the value of endowments. The expenditures reported by 101 teachers' colleges for current expenditures totaled \$24,501,325. The total current expenditures reported by 101 State normal schools were \$15,134,791. The city normal schools reported a total for current expenditures of \$2,039,851. The county normal schools reported a total of \$595,089, and the total current expenditures reported by 37 private teacher-training schools were \$3,428,879.

UNIVERSITY EXTENSION. See EDUCATION.

UPPER SENEGAL AND NIGER. A colony under the government-general of French West Africa; officially known since Dec. 4, 1920, as French Sudan. See FRENCH SUDAN and FRENCH WEST AFRICA.

UPPER SILESIA. See POLAND.

UR. See ARCHÆOLOGY.

URUGUAY, ū'ru-gwā or ō'rōōgwī. A republic of South America bounded by Bolivia, Argentina, and Brazil. Capital, Montevideo.

AREA AND POPULATION. Area, 72,153 square miles; population, at the beginning of 1928, 1,762,451. The chief cities with their populations on Dec. 31, 1926, were Montevideo, 439,129; Paysandu, 26,000; Salto, 30,000, and Mercedes, 23,000. The movement of population in 1927 was: Births, 42,845; deaths, 19,944; marriages, 10,243. The immigrants in 1926 numbered 170,535; the emigrants, 153,016. The immigrants came chiefly from Spain, Italy, Brazil, France, Germany, Great Britain, and Argentina.

EDUCATION. According to figures published by the General Bureau of Statistics, elementary education in Uruguay during 1927 was given by 4425 teachers and assistant teachers to an average of 122,872 children attending 1464 primary schools. There were in addition night schools for adults, normal institutes, schools for deaf-mute children, open air schools, etc.

PRODUCTION. About 60 per cent of the total area is devoted to stock raising, about 20 per cent to mixed farms and ranches, and 5 per cent to purely agricultural farms. The value of the principal crops for the agricultural year 1926-27 was as follows: Wheat, 14,155,000 pesos; corn, 3,910,000 pesos; linseed, 3,917,000 pesos. According to the livestock census of 1924 there were 8,432,000 cattle, 14,443,000 sheep, 18,800 goats, and 251,000 swine. The estimated production of the principal crops for 1927-28 was as follows: Corn, 233,463 tons;

wheat, 377,944 tons; flax, 52,007 tons; oats, 38,398 tons; barley, 1745 tons; birdseed, 560 tons; and rye, 106 tons. Cattle to the number of 689,541, and 1,494,645 sheep were slaughtered in 1927. The 1926-27 wool clip was estimated at about 125,000 bales of about 1000 pounds each, while the 1927-28 clip was placed at 130,000 bales.

Deposits of various minerals, including gold, copper, manganese, and petroleum, have been found, but mining is little developed. Exports of mineral products amounted to 2,658,000 pesos (\$2,694,000) in 1927, an increase of about 900,000 pesos over 1926. The only manufacturing industry of importance is the preparation of products of the stock-raising industry. About 70 per cent of the industrial establishments are located in the Department of Montevideo, which in 1926 had 4468 establishments with 53,381 employees.

COMMERCE. Uruguay's export trade consists chiefly of pastoral products and, to a lesser extent, of agricultural products. In 1927 total exports amounted to 96,674,131 pesos, an increase of 2,370,641 pesos over 1926, owing largely to greater exports of wheat and wheat flour, linseed, wool, hides, and sand, the rise being all the more noteworthy considering that exports of meat and meat products declined nearly 10,000,000 pesos. About 19 per cent of these exports went to the United Kingdom and about 18 per cent to Germany as against 14.2 per cent to Argentina, 13.8 per cent to France, 8.2 per cent to Belgium, and 7.7 per cent to the United States. As usual the bulk of the shipments to the United States consisted of wool, hides, and canned meats.

Uruguay's import trade is in contrast to its export trade. It consists of a great variety of manufactured and other products. In 1927, out of a total import trade of 84,003,934 pesos, an increase of about 10,000,000 pesos over that of the previous year, the following commodities were valued between 1,000,000 and 6,000,000 pesos: Olive oil, refined sugar, yerba mate, automobiles, tires, pine lumber in general, potatoes, naphtha, common yams, silk, and coal. Uruguay's chief suppliers were the United States, Great Britain, Germany, and France. In 1927 the United States supplied 30.3 per cent of the total, as against 15.7 per cent by Great Britain, 10 per cent by Germany, and 6.3 per cent by France. The most important imports from the United States are automobiles, petroleum, and petroleum products.

FINANCE. The estimated receipts and recommended expenditures for the fiscal year 1928-29 totaled 55,066,351 and 55,450,795 pesos, respectively—thus anticipating a deficit of 384,444 pesos. The national council of administration stated that these figures did not include extraordinary appropriations annually authorized by the legislature for special purposes or for supplementing insufficient appropriations. If these expenditures be included in the budget for 1928-29, the estimated deficit would amount to 1,384,000 pesos. It was hoped, however, that the surplus of the 1927-28 budget would cover the total deficit of the 1928-29 budget. The total public debt on Aug. 31, 1927, was 218,309,000 pesos.

COMMUNICATIONS. The transportation facilities of Uruguay are not highly developed. There are two important rivers, the Uruguay and the

Negro, both of which are navigable by large sea-going vessels, the former for about 200 miles and the latter for about 30 miles, but they are not extensively utilized. In 1926, the two companies which maintain regular steamship service between Montevideo and Buenos Aires, carried both ways total cargoes of 55,278 tons as against 47,261 tons in 1925. In 1927 there entered the ports of the country 12,503 vessels with a total of 15,037,000 net registered tons.

The country has 1585 miles of steam railways, or about 22 miles per 1000 square miles, of which about 90 per cent is owned by private interests and the remainder by the Government. Of the total railway mileage of the country, a little over one-half is owned by a single company, the Central del Uruguay, whose lines link Montevideo with the border towns in the far east, north, and on the south coasts. The highway system of the country is composed of 548 miles of hard-surfaced roads, all of which are around Montevideo, and 4624 miles of dirt roads, throughout the country. On Mar. 31, 1928, there were 23,793 telephones in use in the country, 16,236 of these being in the Montevideo city area.

GOVERNMENT. Under the constitution of Jan. 3, 1918, legislative power is vested in the Parliament of two Houses, the Chamber of Representatives, elected by universal suffrage of males over 18 years of age, and the Senate, chosen by an electoral college which is elected by popular vote. Executive power is vested in the President, elected by direct popular vote and a national administrative council of nine members. President in 1928, Dr. Juan Campisteguy, elected for the term Mar. 1, 1927-Feb. 28, 1931.

UTAH. POPULATION. According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 449,396. The estimated population on July 1, 1928, was 531,000. The capital is Salt Lake City.

AGRICULTURE. The following table gives the acreage, production, and value of the principal crops in 1927 and 1928:

Crop	Year	Acreage	Prod. bu.	Value
Hay	1928	647,000	1,500,000 *	\$17,380,000
	1927	644,000	1,574,000 *	14,311,000
Wheat	1928	257,000	6,861,000	6,738,000
	1927	242,000	5,678,000	5,792,000
Potatoes	1928	23,000	3,312,000	1,490,000
	1927	22,000	2,970,000	2,228,000
Sugar beets	1928	53,000	623,000 *
	1927	55,000	677,000 *	4,761,000
Oats	1928	55,000	2,475,000	1,386,000
	1927	51,000	2,142,000	1,285,000
Barley	1928	34,000	1,656,000	1,216,000
	1927	30,000	1,410,000	1,072,000

* tons.

MINERAL PRODUCTION. The metals, copper, lead, silver, zinc, and gold, given in the order of the annual value of their product, furnish about four-fifths of the entire mineral output of the State. Coal supplies the greater part of the remainder. The value of the combined mine production of the five important metals was much less, however, for 1927, than it had been for 1926. The total for 1927 was \$73,626,632; for 1926, \$82,662,884. The decrease was due to lower prices for all the metals named except gold. The quantities produced in 1927 in each case either exceeded those for 1926 or fell but little below. These quantities were: gold, 1927, 193,909 fine ounces, 1926, 182,763; silver, 1927, 18,606,950 fine ounces, 1926, 19,358,581; copper, 1927, 256,933,273 pounds, 1926, 257,464,482;

lead, 1927, 302,570,040 pounds, 1926, 295,270,025; zinc, 99,185,443 pounds, 1926, 95,179,380. In point of total value, copper production was foremost, attaining \$36,045,027 for 1926; lead attained \$23,621,602; silver, \$12,079,755; zinc, \$7,138,454; gold, \$3,778,046. The quantity of coal mined in 1927 was 4,781,480 net tons and that in 1926, 4,373,793 tons; the value of the output was \$11,084,000 for 1927 and \$10,362,000 for 1926. Clay products to the value of \$929,782 for 1926, native asphalt (\$886,730 for 1926), stone (\$623,608 for 1926), salt, iron ore, pig iron, lime, and arsenious oxide were the chief other items of production. The total value of the State's mineral products was \$98,985,218 for 1926; for 1925, \$100,275,442.

The 1928 production of gold was \$4,301,000; of silver, 16,682,000 ounces, having a value of \$9,759,000; copper, 290,044,000 pounds, \$42,846,000; lead, 286,792,000 pounds, \$17,494,000; zinc, 97,034,000 pounds, \$5,822,000. For all five metals, the value of the production was \$79,722,000.

FINANCE. State expenditures in the year ended June 30, 1927, as reported by the United States Department of Commerce, were: for maintenance and operation of governmental departments, \$8,003,287 (of which \$3,712,725 was aid to local education); for interest on debt, \$457,633; for permanent improvements, \$1,974,947; total, \$10,435,867 (of which \$2,645,779 was for highways, \$860,832 being for maintenance and \$1,784,947 for construction). Revenue was \$11,062,291. Of this, property and special taxes formed 51.0 per cent; departmental earnings and charges for officers' services, 7.5 per cent; sales of licenses and taxation of cigarettes and gasoline, 22.1 per cent. Property valuation was \$696,061,566; State taxation thereon, \$5,244,841. Net funded State debt on June 30, 1927, was \$6,594,750.

TRANSPORTATION. The total number of miles of railroad line under operation on Jan. 1, 1928, was 2193.89. There was built in 1928, 0.64 mile of additional second track.

EDUCATION. State Superintendent Jensen reported steady progress in 1928 in the development of all divisions of the public-school system of the State. The school population as estimated for the academic year 1927-28 was 143,811. There were enrolled in the public schools in that year 133,829 pupils; of these, 105,776 were in the elementary grades and 28,053 in the high schools. The expenditures of the year for public-school education within the State, including capital outlay and debt service, amounted to \$11,121,980. The averages of teachers' salaries were: in elementary schools, \$1128; in junior high schools, \$1502; in senior high schools, \$1642.

CHARITIES AND CORRECTIONS. The functions of central control over the activities of the State in the care and custody of individuals are not combined in any single unit. A Board of Corrections, consisting of the Governor and of two appointed members serving terms of four years, exercises authority over penal institutions. Matters relative to the insane come under an Insanity Board consisting of the Governor, State Auditor, and State Treasurer. The State beneficent and custodial institutions are State School for the Deaf and Blind, at Ogden; State Industrial School, Ogden; State Mental Hospital, Provo; State Prison, Salt Lake City. The first two have their own boards of trustees. The

last two are under the Board of Insanity and the Board of Corrections, respectively. Prison admittances in 1927 numbered 145; State prisoners in custody at the outset of 1928, 208. Mental patients at the State Hospital at the beginning of 1928 totaled 809.

POLITICAL AND OTHER EVENTS. Passenger and mail service by airplane between Salt Lake City and Great Falls, Mont., began operation August 1. The State Securities Commission put in force regulations governing investment trusts in the State. Governor Dern continued efforts to bring Utah and the other Colorado Basin States into agreement on the Boulder Dam project by conferences.

ELECTION. In the election of November 6, Herbert Hoover, Republican, gained a small plurality over Alfred E. Smith, Democrat, in the popular vote for President. The vote was: Hoover, 94,618; Smith, 80,985. A great part of the Progressive vote of 1924 apparently went to Smith, but not enough of it to give him the State. George H. Dern, Democrat, was reelected Governor. United States Senator William H. King, likewise, was reelected on the Democratic ticket. The two incumbents, both Republican, were returned to the House of Representatives.

OFFICERS. Governor, George H. Dern; Secretary of State, H. E. Crockett; Treasurer, John Walker; Auditor, John E. Holden; Attorney-General, Harvey H. Cluff; Superintendent of Public Instruction, C. N. Jensen.

JUDICIARY. Supreme Court, Chief Justice, Samuel R. Thurman; Associate Justices, Elias Hansen, James W. Cherry, N. D. Straup, Valentine Gideon.

UTAH, UNIVERSITY OF. A State institution of higher education at Salt Lake City, founded in 1850. The total enrollment for the autumn of 1928 was 2791, and for the summer session of the same year, 741. The teaching faculty, exclusive of 11 on leave of absence, studying at other institutions, numbered 173. The productive funds of the university amounted to \$809,142, and the income for 1927-28 was \$895,489. The library contained 95,319 volumes and 28,285 pamphlets. President, George Thomas, Ph.D.

VACCINATION. See HYDROPHOBIA; SMALL POX AND VACCINATION.

VALLEY FORGE ANNIVERSARY. See CELEBRATIONS.

VANADIUM. In the United States the greater part of the vanadium used was imported from Peru, the amount during the year totaling 498 tons of vanadium ores, valued at \$49,771 as against imports of 6199 tons, valued at \$561,051 in the previous year. The 1928 ore supply was estimated to carry from 11 to 12 per cent of vanadium. In the United States, a single mine on East Rifle Creek in Colorado and the oxide plant on the railroad at Rifle Creek southwest of the mine was the single domestic source of vanadium oxide. The ore as found here was a roscoelite bearing sandstone probably accompanied by other vanadium minerals. The vanadium oxide thus obtained was shipped to Niagara Falls and reduced to ferro-vanadium. The Peruvian mines of the Vanadium Corporation of America shipped to the United States; while Europe received its ores from South Africa. Vanadium was finding application as a catalyst in the manufactures of sulphuric acid and various organic compounds. By the use of certain vanadium salts a cheaper

and more efficient process than with platinum sponge could be developed as the salts were not poisoned and were found much cheaper.

VANDERBILT UNIVERSITY. A non-sectarian institution of higher learning for men and women at Nashville, Tenn., founded in 1873. The enrollment in the autumn term of 1928 was 1404 students, distributed as follows: Graduate students, 116; college of arts and science, 751; school of engineering, 134; school of religion, 82; school of law, 83; school of medicine, 181; school of nursing, 57. The students in the college of arts and science comprised 551 men and 200 women. The faculty, exclusive of administrative officers, librarians, and assistants, numbered 180. Productive funds of the University amounted to \$9,000,000; the annual income was about \$800,000; and the value of the property was estimated at \$5,650,000. The library contained 144,000 volumes. Chancellor, James H. Kirkland, Ph.D., LL.D., D.C.L.

VASSAR COLLEGE. A non-sectarian institution for the higher education of women at Poughkeepsie, N. Y., founded in 1861. The enrollment for the autumn of 1928 was 1155, distributed as follows: Seniors, 228; juniors, 282; sophomores, 310; freshmen, 335; and a summer institute of eugenics was held with a registration of 88. The teaching staff for the year 1928-29 had 152 members, including 6 on leave of absence, 5 student assistants, 1 teaching fellow, and 1 reader. The endowment, including fellowships and scholarships, amounted to \$6,884,056 and the income for the year to \$359,668. Gifts received during 1927-28 were in excess of \$500,000. There were 156,000 volumes in the library. The Minnie Cumnock Blodgett Hall of Eugenics was opened in the autumn of 1928. President, Henry Noble MacCracken, Ph.D., LL.D., LL.D.

VATICAN. See ROMAN CATHOLIC CHURCH.

VEHICLES, VEHICLE CODE. See AUTOMOBILES.

VENEREAL (vē-ně'rě-al) DISEASES. It is a singular coincidence, to go no further, that the two microorganisms which are responsible for the major venereal diseases—to wit, the *gonococcus* and the *treponema pallidum*—are very susceptible to the action of high temperatures which are at present in extensive therapeutic use. But while in gonorrhea the application of heat is chiefly local in the form of diathermy, in syphilis the temperature elevation is obtained by inoculation with malarial blood or germs and other substances known to raise the general temperature. For some years it has been known that elevation of the general temperature is sufficient to destroy the *treponema* and incidentally to cure a goodly number of victims of paresis, otherwise known as syphilitic meningo-encephalitis; and the suggestion was near at hand that any other stage or form of syphilis could likewise speedily be cured by the rapid and wholesale sterilization caused by the artificial high temperature. The theory is sound enough, but the principle of causing one disease to eliminate another has its drawbacks. In the *Deutsche medizinische Wochenschrift* for June 22, 1928, Professor Zieler, a well-known venereologist of Würzburg, advocated the use of the malarial inoculation for syphilis in a number of special categories of patients, but as a rule only after the drug treatment had proved unsatisfactory. See SYPHILIS.

VENEZUELA, vèn'è-zwè'là, *sp. pron.* vā' nā-thwā'lā or *Amer. Sp. pron.* vā'nā-swā'lā. A republic on the northern coast of South America, bordering on the Caribbean Sea and lying between Colombia on the west, Brazil on the south, and British Guiana on the east. Carácas is the capital.

AREA AND POPULATION. Venezuela has an area of 393,874 square miles; population, according to the census of December, 1926, 3,026,878, as compared with 2,411,952 in 1920. The population of Carácas in 1926 was 135,253, and of other large cities: Maracaibo, 74,767; Valencia, 36,804; Barquisimeto, 23,109; and San Cristobal, 15,295. Official vital statistics for 1927 showed 14,242 marriages, 90,745 births, 58,876 deaths, 21,672 immigrants (1926), and 16,552 emigrants (1926). The increase due to migration in 1927 was 3545.

EDUCATION. According to the latest available statistics, those for December, 1926, school registration in the various types of schools was as follows: Government primary schools, 63,747, and average attendance, 45,847; 341 private schools, 15,302; 236 municipal schools, 10,473; 254 state schools, 9762; special schools, 1618; secondary schools, 588; higher schools, 716.

PRODUCTION. Although Venezuela, since the rapid development in the petroleum industry, is no longer entirely dependent on agricultural crops for prosperity, nevertheless, aside from the oil region around Lake Maracaibo, the country's commercial stability still rests upon the two principal crops, coffee and cacao. Estimates of the 1927 coffee crop placed the yield below that of the poor crop of 1926, in which year 1,012,600 bags of 60 kilos each were exported. The smaller crop in 1927 was caused by an overabundance of rain during the early part of the growing season. The 1927 cacao crop was larger than was at first expected, and exceeded the poor yield of 30,000,000 pounds in 1926, although it was considerably below the 50,000,000 pounds produced in 1925. Sugar is the third export crop, with a yearly yield of around 100,000 tons. The annual crop of cotton is about 20,000 bales; on account of the growing demand from local mills, production is being increased although considerable quantities are still imported. Tobacco is produced principally for local consumption as well as rice, corn, beans, and wheat.

The principal mineral resources consist of gold, copper, asphalt, and petroleum. The last is by far the most important, Venezuela ranking third among the producing countries. The output in 1927 was 64,400,000 barrels, as compared with 37,226,000 barrels in 1926. Unusual progress in the development of the petroleum industry occurred in 1927, in spite of a curtailed construction and drilling programme induced by world overproduction, as well as the lack of sufficient storage and tankers for shipping the oil. Asphalt production in 1927 was 55,906 metric tons; copper smelter output, 136 metric tons; gold production, 43,174 fine ounces. Venezuela has no large factory industries, although the number of establishments is large. The principal manufactures are textiles, sugar, petroleum products, cigarettes, beverages, soap and candles, shoes, glass, furniture, paper, cordage, dairy products, and matches. Petroleum products are becoming increasingly important and a number of small refineries are functioning.

COMMERCE. Official statistics of foreign trade of Venezuela for the calendar year 1927, published in December, 1928, indicated that the value of exports during the year was approximately \$84,288,000 while imports totaled \$69,005,000, leaving a favorable balance of trade amounting to \$15,283,000. Revised figures published at the same time for 1926 gave exports for that year of \$75,364,000 and imports of \$78,600,000, resulting in an unfavorable balance of \$3,236,000. The United States in 1927, as in 1926, supplied more than 50 per cent of Venezuela's imports, with a total value of approximately \$36,056,000.

FINANCE. The budget for the fiscal year ending June 30, 1929, was signed by the President on June 25, 1928. Total revenues and expenditures were calculated at 195,450,000 bolívares, or about 84,000,000 bolívares in excess of the budget for 1927-28. Included in the authorized expenditures was an item of 36,000,000 bolívares for the establishment of two new governmental banks which were opened on July 1, 1928. The total debt of the Republic at the end of 1927 was 77,900,526 bolívares.

COMMUNICATIONS. There are 660 miles of railways, practically all owned by private companies. In 1927, 2,681,000 passengers were carried, gross receipts were 18,007,794 bolívares, total expenditures, 14,126,816 bolívares, and 401,444,505 kilos of freight were carried. On May 1, 1928, following the completion of necessary changes, electric train service was inaugurated on the La Guaira-Carácas Railway, and as a result the company announced a reduction in passenger fares and freight rates. Under the new schedule more frequent trains were to be run each way. The railroad distance is approximately 22 miles, the rise in altitude being 2952 feet. The number of vessels with cargo entering Venezuelan ports in foreign trade in 1926 was 1963 of a capacity of 2,460,000 net registered tons. Clearances of vessels with cargo were 3797 of a capacity of 4,720,000 tons, the marked difference as compared with entrances being largely due to the outgoing movement of petroleum.

GOVERNMENT. According to the constitution of July 1, 1925, the executive power is vested in the President, who acts through a responsible ministry, and who is elected by Congress for seven years; and the legislative power is vested in the Congress, consisting of the Senate and the Chamber of Deputies, the former of 40 members (two from each state) elected for three years, and the latter of one deputy for every 35,000 inhabitants in each state and one more for an excess of 15,000, also elected for three years. President in 1927, General Juan Vicente Gomez (elected May 3, 1922, for the period 1922-1929).

HISTORY. General Gomez had rather a stormy year in 1928. He was one of the original dictators of South America and ruled with an iron hand, although the tremendous influx of wealth due to the discovery of oil had rather upset the country and brought about unrest among the poorer classes and in some sections of the army. Early in April, an abortive revolt occurred in which some parts of the army participated. It was put down, without much bloodshed, by loyal troops. In some quarters it was charged that foreign concessionaires were stirring up trouble in the hope that their governments would intervene and protect

their investments in the country. There was, however, no direct proof for any foundation of these charges. Whatever the reasons, there seemed to be an unsettled state of affairs in the country, because from time to time there appeared in the press statements to the effect that the rule of General Gomez was being seriously threatened and a return to constitutional government was a possibility.

VERMONT. POPULATION. According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 352,428. No later estimate had been prepared. The capital is Montpelier.

AGRICULTURE. The following table gives the acreage, production, and value of the principal crops in 1927 and 1928:

Crop	Year	Acreage	Prod. bu.	Value
Hay	1928	927,000	1,497,000 *	\$17,804,000
	1927	935,000	1,421,000 *	16,581,000
Potatoes	1928	21,000	2,982,000	2,535,000
	1927	21,000	3,255,000	4,069,000
Corn	1928	80,000	3,520,000	3,872,000
	1927	84,000	3,276,000	3,440,000
Oats	1928	79,000	2,686,000	1,880,000
	1927	83,000	3,237,000	2,104,000

* tons.

MINERAL PRODUCTION. Stone quarrying was active in Vermont in 1926. There were quarried 330,230 short tons of stone, as against 283,030 in 1925; the value of the output was \$9,244,465 for 1926 and, for 1925, \$8,958,846. Slate quarrying, classed separately, was second in importance and was active both in 1926 and in 1927. The slate production of 1927 was estimated at \$4,108,911; that of 1926 at \$4,267,041. Of no other mineral did the yearly production reach \$1,000,000. That of lime was 57,000 short tons (estimated) for 1927, and for 1926, 56,378; in value, \$557,000 for 1927 (estimated) and \$677,944 for 1926. Tale was produced in 1926 valued in excess of half a million dollars, and the production of 473,200 pounds of copper, in value \$66,248, was reported. The total value of the mineral products of the State was \$14,955,161 for 1926; for 1925, \$14,408,933.

FINANCE. State expenditure in the year ended June 30, 1927, as reported by the U. S. Department of Commerce, was: for maintenance and operation of governmental departments, \$4,910,879 (of which \$495,915 was aid to local education); for interest on debt, \$84,506; for permanent improvements, \$2,057,411; total, \$7,052,796 (of which \$3,512,903 was for highways, \$1,551,029 being for maintenance and \$1,961,874 for construction). Revenue was \$7,209,368. Of this, property and special taxes formed 38.2 per cent; departmental earnings and charges for officials' services, 5.5 per cent; sales of licenses and taxation of gasoline, 41.0 per cent. Property valuation was \$315,365,500; State taxation thereon, \$1,016,573. Net funded State debt on June 30, 1927, was \$1,693,532.

TRANSPORTATION. The total number of miles of railroad line under operation on Jan. 1, 1928, was 1056.82. No construction of additional railroad trackage in 1928 was reported.

EDUCATION. C. H. Dempsey, State Commissioner of Education, stated at the end of 1928, in the *Journal* of the National Education Association, that the work of standardizing rural schools had progressed, there being over 400 such schools standardized as to building, equipment, teaching and administration. The school population for 1927, as reported by him, was 76,020; there were

enrolled in the public schools of the State in the academic year 1927-28, 64,529 pupils. Of these, 52,254 were in elementary schools and 12,725 were in high schools. There was expended for public-school education in the State in that year the sum of \$4,598,849.09.

CHARITIES AND CORRECTIONS. The Department of Public Welfare, under an appointed Commissioner, exercises direction of State institutions and a variety of other functions, including child-care supervision, the granting of mothers' pensions, probation, and parole. The State institutions under the Board's care in 1928 were: Vermont State Hospital, Waterbury; Vermont Industrial School (delinquents), Vergennes; State School for the Feeble-Minded, Brandon; Vermont Sanatorium (indigent tubercular), Pittsford; Women's Prison and House of Correction, Rutland; and the State Prison and House of Correction, Windsor.

POLITICAL AND OTHER EVENTS. The calamitous floods of 1927 led to the creation of a special committee, recommended by the Public Service Commission and appointed by Governor Weeks, to survey the possibilities of flood control in the State. Early in its work, this committee recommended that State agencies dispose of the quantities of wreckage left stranded along the river banks, and pointed out that a subsequent flood, even of comparatively small proportions, might float such wreckage and bear it down against bridges, if it should be allowed to remain. Particular attention was given to the Winooski River, and efforts were made to determine to what extent flood hazards might be reduced in the State by the construction of reservoirs with possibilities of power output. An issue of \$5,000,000 of 3¾ per cent bonds of the State for the reparation of property damaged by the 1927 floods was sold in January, through J. P. Morgan & Company, under unusual circumstances, the bankers, notably, exacting no commission. The White River Railroad, destroyed by the flood, resumed operations in the latter part of 1928, the necessary capital being locally subscribed. The State acquired in the fiscal year ending June 30, 1530 acres of forest land by purchase and 900 by gift, bringing its total holdings to 33,725 acres. See FLOODS.

ELECTION. The popular vote for President in the State, at the election of November 6, was: Hoover (Republican), 90,404; Smith (Democratic), 41,440. The Democratic vote, though completely outdistanced, was in its turn more than twice that in either of the last two preceding presidential elections. The Republican vote likewise reflected United State Senator Frank L. Greene for the ensuing regular term; returned to the House of Representatives the two incumbents, both Republican; and reelected Governor John E. Weeks.

OFFICERS. Governor, John E. Weeks; Lieutenant-Governor, Stanley C. Wilson; Secretary of State, Rawson C. Myrick; Treasurer, Thomas H. Cave; Auditor, Benjamin Gates; Attorney-General, J. Ward Carver; Commissioner of Education, C. H. Dempsey.

JUDICIARY. Supreme Court: Chief Justice, John H. Watson; Associate Justices, George M. Powers, Leighton P. Slack, Sherman R. Moulton, and Harrie B. Chase.

VERMONT, UNIVERSITY OF. An endowed institution of higher education at Burlington, Vt., receiving some State aid; founded by Ira Allen

in 1791. The 1928 autumn enrollment was 1310, of whom 581 were women and 729 men. The total enrollment was distributed as follows: arts and sciences, 804; medicine, 140; engineering, 138; agriculture, 111; graduate students, 12; two-year State teacher-training course, 105. The summer-session registration in 1928 amounted to 912. The library contained 133,000 volumes. The endowment amounted to \$1,900,000, and the income for the year to \$600,000. President, Guy W. Bailey, LL.D.

VETERANS' BUREAU. See UNITED STATES.

VETERINARY MEDICINE. The year 1928 saw no new invasion of the United States by livestock diseases from abroad, and was marked by a steady advance in the control and eradication of some of the most important maladies, particularly tuberculosis, Texas fever, and dourine of cattle. Particular mention should be made of anaplasmosis of cattle as a disease that became of major importance. Much progress was made in the advancement of knowledge of some of the diseases as applied especially to their diagnosis and to prevention through immunization.

There was a marked increase in the attendance at accredited veterinary colleges of which there are twelve. The Federal Agricultural Appropriation Act, which became effective July 1, included \$5,744,710 for the campaign against tuberculosis and paratuberculosis; \$20,000 for work with anaplasmosis of cattle; \$5000 for a loco weed survey in the Southwest; and \$40,000 for additional studies of animal parasites. The appropriation for work with infectious abortion was \$50,625; and for cattle-tick eradication, \$720,400; dourine eradication, \$27,800; and hog-cholera work, \$464,670.

Among the more prominent investigators in animal pathology of which the year saw the passing were: Dr. Ernest C. Schroeder, known for his work on tuberculosis and infectious abortion, on January 24 at the age of 63 years; Dr. Charles F. Dawson, known for his work on anthrax, on February 26 at the age of 65 years; and Dr. Samuel H. Burnett, author of *The Clinical Pathology of the Blood of Animals*, on November 18 at the age of 59 years.

LIVESTOCK TUBERCULOSIS ERADICATION. Marked progress was made in practically all States in the cooperative eradication work with tuberculosis of livestock, in its thirteenth year in 1928, in which 923 veterinarians were regularly engaged. There was a large increase in the number of cattle tested and in the growth of the area eradication work, to which particular attention was given. Much progress also was made in systematizing plans for the control of avian tuberculosis. The Federal appropriation for the year ended June 30, 1928, was \$5,964,000 and the combined State appropriations were more than \$13,000,000, these funds making possible an increase of 16 per cent in the number of cattle tested.

The plans for the work included (1) the eradication of tuberculosis under the accredited herd plan; (2) the area plan; (3) the eradication of the disease from swine; (4) investigations relative to interstate shipments; and (5) tuberculosis in fowls. There has also been added work looking for the control of paratuberculosis, known as Johne's disease.

The area work continued to grow, approximately 77 per cent of the total number of cattle tested having been tested under this plan. At the conclusion of the fiscal year, 1119 counties and the District of Columbia had engaged in area work, an increase of 166 counties, or approximately 17 per cent over the number for the preceding year. The modified accredited counties increased in number under the plan in effect by 187, and at the close of the year there were 527 such counties.

At the close of the fiscal year on June 30, there were 2,290,732 herds and 21,418,977 head of cattle under supervision, or approximately 35 per cent of the entire number of cattle in the United States. In 17 States, more than 50 per cent of the cattle was under careful supervision. On July 1, 169,356 herds were listed as fully accredited. The tuberculin test was administered to 11,281,490 cattle, or more than a million and a half in excess of the preceding year's record, of which 2.3 per cent reacted. There were on June 30, 169,356 herds finally accredited as tuberculosis free, having passed two or more tests, an increase of 38,880 accredited herds in one year.

The work of eradicating tuberculosis from swine and poultry was continued with satisfactory progress. Of the 226,104 flocks containing approximately 20,400,000 fowls inspected in 28 States, nearly 14,000 were found to be infected with tuberculosis. It was found that the avian type may be perpetuated in swine independent of contact with infected chickens or contaminated ground.

The State of North Carolina completed the tuberculin testing of all cattle in the last four of its 100 counties early in October, and won the distinction of being the first State to have 100 per cent of its counties classed as "modified accredited areas" in which areas not more than 0.5 per cent of the cattle are tuberculous and from which all animals reacting to the test have been removed for slaughter. Maine was following closely, having 13 of its 16 counties already in the modified accredited areas.

Since the campaign was inaugurated in 1917, the degree of infection in cattle throughout the United States had been reduced from 4 to nearly 2 per cent, and a total of 581 counties and 21 townships in 11 States have been placed on the modified accredited list.

HOG CHOLERA. The disease was again prevalent in many States, particularly in September, October, and November, when its greatest ravages occur. Eleven States reported more cholera than in the preceding year, five as approximately the same, and four as less. The total number of outbreaks reported from all sources during the fiscal year was 6689, a marked decline from 11,555, the corresponding number for the preceding year.

TEXAS-FEVER AND CATTLE-TICK ERADICATION. The progress in cattle-tick eradication by the Federal Department of Agriculture in cooperation with State and county officials and stock owners continued. During the fiscal year ended June 30, the following areas were released from Federal quarantine as a result of the work conducted therein: 1 county in Alabama; 5 counties, the remainder of 2 counties, and parts of 2 counties, in Arkansas; 2 counties and the remainder of 3 counties in Florida; 1 county and the remainder of 1 county in South Carolina; 8 counties and part of 1 county in Texas; and 1

county in Virginia. During this period, one parish in Louisiana was requarantined. A total of 760 of the 985 counties and parishes in the 15 States quarantined on July 1, 1906, have been released as tick free as a result of the work that has been under way for 22 years. In the course of the year's work, 17,627,260 inspections or dippings were made and more than 15,000 dipping vats were used. The Louisiana parishes of West Baton Rouge, Assumption, and part of Ascension were kept tick free as a result of the restocking work conducted in the Mississippi flood areas in that State where all cattle had been forced out and ticks destroyed by the great overflow. The eradication work was furthered by the new Federal regulation, promulgated under authority of the Crisp Act, which became effective on May 1. This regulation provides for the dipping and certification as tick free of all cattle shipped from the quarantined area for immediate slaughter, similar to that required in the interstate shipment of other cattle.

DOURINE ERADICATION. The work of eradicating dourine was continued on the Navajo Indian Reservation in Arizona and in a small section of northern Montana, the only areas in which the disease was known to exist. Only one-third as many reactors were found on the Navajo Reservation as in the previous year and only twelve, or 1.1 per cent, of the number tested in Montana, indicating marked progress in the work. Of the 14,272 samples of blood serum tested, 3.2 per cent gave positive reactions.

SCABIES ERADICATION. There was an increase in the number of sheep found, upon inspection, to be affected with scabies by approximately 27 per cent over the preceding year. There were 22,935,543 inspections made in the field and 3,474,822 dippings supervised. Several affected flocks were located in West Virginia and Maryland where the disease had not previously been reported. In work with cattle scabies, 3,267,020 were inspected and 765,322 dippings supervised. There was an increase in 4 States in the number of animals reported affected, while less infection was found in 6 States. Outbreaks were reported in Arizona and California, where none occurred during the preceding year. In Texas, 568 of the 11,934 goats inspected were found affected and in Montana 369 of the 4875 horses that were inspected.

INFECTIOUS ABORTION AND UNDULANT FEVER (BANG). This disease continued to hold its place as the most important affection of cattle, its annual financial toll in the United States; as estimated by the chief of the Federal Bureau of Animal Industry, probably exceeding \$50,000,000. It was pointed out that ten years ago the losses from tuberculosis and abortion were about the same, but in this decade the tuberculosis losses had been reduced by one-half, while the abortion losses had doubled. The identification of the abortion organism with undulant fever (Bang) in man had resulted in the recognition of the occurrence of this disease in increasing frequency. Carpenter and Boak working in New York found that the causative organism was destroyed by exposure for 20 minutes to a temperature of 140° Fahr. as commonly employed for the pasteurization of milk, the porcine strain being most resistant. Much progress was made in control work. Graham, Tunnicliff, and McCullough in Illinois found that the agglutination test for the detection of the abortion organism is as ac-

curate a method of diagnosis as is the tuberculin test for tuberculosis. Work in California has demonstrated that the vaccination of cows with living virulent cultures of the causative organism will confer a resistance to this type of abortion for at least three regular gestation periods.

ANAPLASMOSIS. This malignant febrile disease of cattle was increasing in importance. Though occurring chiefly in the Southern States, including Florida, Louisiana, and Texas, it was found in Oklahoma and Kansas, and as far west as Nevada and California. It apparently had no connection with tick fever. Giltner reported that in an outbreak in Florida as high as 30 per cent of the herd was lost in some instances, while Stiles found a 26 per cent mortality in Oklahoma and a 39 per cent loss in Kansas. Hiltz in Nevada found its transmission to take place through the dehorning clippers.

FOOT-AND-MOUTH DISEASE. The United States remained free from invasion by this malady of the cloven-footed animals which takes a heavy toll in all the countries in which it is firmly established. A special report of 172 pages was issued by the American Foot-and-Mouth Disease Commission which had conducted extensive investigations of the disease in Europe. The commission indorsed the slaughter and quarantine method, with supplementary safeguards, regularly used for eradicating the disease when it has appeared in the United States, as not only the most effective but also the most economical. A third progress report was issued during the year by the British Research Committee.

BACILLARY WHITE DIARRHEA OF THE FOWL. The activity in research on this disease of the fowl continued unabated, it being aimed particularly at improvement of means of detecting the infection. Considerable attention was given to the simpler pullorin test, but thus far the agglutination, or blood, test had been found to be the more reliable method. Mathews in Indiana found that accidentally broken and consumed eggs from infected fowls offers the best explanation of the spread of the disease in mature fowls. Olney reported the loss of 125 rabbits in Nebraska through having been fed incubated infertile eggs containing *Salmonella pullorum*. Dalling, Mason, and Gordon in England reported the isolation of the causative organism from sparrows collected in chicken runs in which were infected chickens. An outbreak of the disease in a flock of baby turkeys was reported by Hewitt in Minnesota, this being the first definite record of its occurrence in the turkey.

FOWL TYPHOID. In Delaware, Palmer and Baker found that the use of living avirulent strains of the fowl typhoid organism reduced the mortality by one-third and that the method is of considerable economic value. Chicks hatched from parents both of which had survived an acute infection of fowl typhoid showed considerable increased resistance to the infection in work by Lambert and Knox in Iowa.

FOWL PARALYSIS. Gildow, working in New Hampshire, was led to conclude that coccidiosis is in most instances in that State closely associated with paralysis in the fowl although there is a form which is not connected with any of the internal parasites. Studies in Indiana led to the conclusion that the virus of the disease may be transmitted through the egg.

BLACKHEAD OF TURKEYS. Work in Connecticut by Rettger and Kirkpatrick showed that, by the

use of the rotation system, turkeys can be reared in successive years without serious losses from blackhead. They conclude that chickens and other barnyard fowls transmit the disease and that ground that has been occupied by them constitutes an immediate source of infection. The rotation method, in which poultts were moved to new ground about every week, again proved effective in Rhode Island.

FOWL POX. Much progress was made in immunization work with this disease as reported by Beach in California and Pyle in Massachusetts.

A NEW DISEASE OF FOWLS. An important disease of the fowl not previously recognized was studied and reported upon by Kaupp, Dearstyne, et al. in North Carolina to which the name infectious purulent enteroproventriculitis was given. It was found to be due to a filterable virus.

PLANT POISONING. It was found by Marsh, Clawson, and Roe that coyotillo (*Karwinskia humboldtiana*), a plant growing in southwestern Texas and in Mexico, produces a more or less complete paralysis in cattle, sheep, goats, pigs, and chickens that feed upon it and probably also in horses and swine. In severe cases, recovery seldom occurs. Fleming and Dill found in Nevada that the poisoning of sheep and cattle that takes place immediately after drinking from mountain streams is caused by the release of the poison from the leaves of the western chokecherry on which they have fed, by the excess of water. Fleming, Miller, and Vowter reported that the poisoning of sheep on the range in Nevada by greasewood is undoubtedly due to the oxalic acid content. The investigations of Couch led him to conclude that tremetal is the toxic constituent of richweed causing trembles and milk sickness. The seed of the coffee-bean plant, a native of Mexico naturalized in the northern part of Florida and in other Gulf States, often being found in back yards, was discovered by Shealy and Thomas to be poisonous to, and causing the loss of, poultry. Roderick and Schalk, finding in North Dakota that sweet-clover poisoning cannot be detected from the external appearance of the animal until considerable damage has been done and that rabbits are more susceptible than cattle, made use of these rodents in detecting the moldy hay. When the death of the rabbit is caused in six or seven days after feeding upon the hay, it will seriously affect the cattle, but, if the rabbit feeds upon the hay for two weeks or more before it dies, the hay will be safe to feed to cattle.

VICTORIA. A state of the Australian Commonwealth, situated in the southeastern part of the island continent. Area, 87,884 square miles; population, according to the census of 1921, 1,531,280; estimated June 30, 1927, 1,726,445. Capital, Melbourne, with an estimated population, including suburbs, on Dec. 31, 1926, of 944,400. The other large cities with their populations on that date, were Ballarat, 41,550; Geelong, 40,880; Bendigo, 33,830. The movement of population in 1926 was: Births, 35,362; deaths, 16,355; marriages, 13,405; immigration (by sea), 88,026; emigration (by sea), 73,799.

Public instruction is secular, free, and compulsory for children between the ages of 6 and 14. In 1925 there were 2525 state schools with 7020 teachers, a total enrollment of 255,101 scholars, and an average attendance of 175,131. The area and yield of the principal crops in 1927 were: Wheat, 2,915,000 acres, 46,886,000 bushels; oats, 303,000 acres, 4,884,000 bushels; barley, 89,000 acres, 1,921,000 bushels; potatoes, 66,000 acres, 163,000 tons; hay, 1,081,000 acres, 1,388,000 tons; vines (1926), 40,712 acres, 1,637,274 gallons of wine. The wool industry is of great importance. At the end of March, 1927, there were 14,919,653 sheep, and the value of the wool clip in the preceding year was £7,082,820. The mineral resources are abundant, especially coal and gold ores. The output of the former in 1926 was 581,001 tons valued at £657,798; of the latter, 49,078 fine ounces valued at £208,471. The value of the total quantity of gold produced from 1851 to 1926 was estimated at £302,548,425. No later statistics on manufacturing were available than those given in the preceding YEAR BOOK.

In 1926-27 the total value of overseas imports was £55,559,214; of overseas exports, £34,682,813. The revenue in 1927 amounted to £26,377,928; expenditure, £27,019,132. Victoria has a debt, incurred in the construction of public works, which amounted on June 30, 1926, to £140,264,989. The total railway mileage in 1925-26 was 4682 miles, as compared with 4539 in 1924-25.

The executive power is vested in a governor, acting through a responsible ministry, and the legislative power in a parliament of two houses; namely, the legislative council of 34 members elected for six years and subject to property qualifications, and a legislative assembly of 65 members elected for three years (unless sooner dissolved) by universal male and female suffrage. The Governor in 1928 was Lieut.-Col. Lord Arthur H. T. Somers, Premier, Treasurer, and Minister of Markets, E. J. Hogan. Mr. Hogan's government (Labor) resigned on November 21 and was succeeded by a Nationalist ministry led by Sir William McPherson.

VILLARD, MRS. FANNY GARRISON. American philanthropist and reformer, died at Dobbs Ferry, N. Y., July 5. She was born at Boston, Mass., Dec. 16, 1844, and was the daughter of William Lloyd Garrison, famous advocate of women's rights, world peace, temperance, and the abolition of slavery. As a young girl, she read the proofs for *The Liberator*, the militant weekly of her father, and her contact with the reformers associated with Mr. Garrison aided in developing the crusader spirit that animated her long life. In 1866 she was married to Henry Villard, jour-

nalist and financier, who died in 1900. Mrs. Villard was one of the first women in the United States to partake actively in the movement for woman suffrage; in this, she was closely associated with Anna Shaw, Mrs. Carrie Chapman Catt, and other well-known leaders. She appeared before legislative bodies and other assemblages for the cause, and was an effective speaker. When woman suffrage was won, she was able to devote more time to another cause that was close to her heart, that of international peace. She founded the Woman's Peace Society, an organization based on non-resistance theories. She was also active in numerous philanthropies in New York and elsewhere, and in educational movements.

VIOLINISTS. See Music.

VIRGINIA. POPULATION. According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 2,309,187. The estimated population on July 1, 1928, was 2,575,000. The capital is Richmond.

AGRICULTURE. The following table gives the acreage, production, and value of the principal crops in 1927 and 1928:

Crop	Year	Acreage	Prod. bu.	Value
Corn	1928	1,642,000	45,155,000	\$45,155,000
	1927	1,626,000	47,967,000	44,130,000
Tobacco	1928	186,000	111,600,000 ^a	19,180,000
	1927	177,000	127,971,000 ^a	22,828,000
Hay	1928	1,084,000	1,479,000 ^b	22,522,000
	1927	1,100,000	1,501,000 ^b	23,929,000
Potatoes	1928	151,000	21,593,000	10,796,000
	1927	180,000	19,760,000	25,688,000
Sweet potatoes	1928	44,000	6,336,000	6,019,000
	1927	43,000	5,805,000	4,934,000
Wheat	1928	673,000	9,758,000	13,173,000
	1927	687,000	8,381,000	11,063,000
Apples	1928	16,100,000	13,685,000
	1927	6,600,000	8,910,000
Peanuts	1928	152,000	138,320,000 ^a	6,500,000
	1927	152,000	123,120,000 ^a	5,540,000
Cotton	1928	79,000	44,000 ^c	4,004,000
	1927	64,000	31,000 ^c	3,100,000
Oats	1928	182,000	4,641,000	2,970,000
	1927	186,000	3,999,000	2,559,000

^a pounds, ^b tons, ^c bales.

MINERAL PRODUCTION. Coal production furnishing the greater part of the State's mineral total year by year, receded for 1927 from the high aggregate of 1926 to about the level of 1925. There were mined in 1927 12,916,042 net tons of coal, and in 1926, 14,133,386 tons; in value, \$23,203,000 for 1927 and \$27,203,000 for 1926. Of the 1927 production, 522,497 tons were coked at the mines, in Wise County. No by-product coke operations were reported up to the end of 1927. Beehive coke ovens in the State, however, produced 910,000 short tons of coke in 1927, as against 370,983 in 1926, when the output was valued at \$1,716,716. Blast-furnace output of pig iron fell off to 84,920 long tons for 1927, from 105,019 for 1926; in value, \$782,538 for 1927 and \$2,322,451 for 1926. The iron mines of the State, on the other hand, shipped more iron ore in 1927, the quantity being 66,897 long tons, as against 47,703 in 1926; in value, \$172,877 in 1927 and \$162,446 in 1926. The ore smelted came largely from outside the State. Clay products attained \$3,755,980 for 1926, and for 1925, \$3,909,634. Stone was quarried to the value of \$3,504,671 in 1926 and of \$3,224,258 in 1925. The lime output of 1927 was 172,000 short tons (estimated) and that of 1926, 188,696; in value, \$1,250,000 (estimated) for 1927 and for 1926, \$1,453,095. Lead, zinc, manganese, and manganiferous ores were produced in minor amounts. The total value

of the State's mineral products was \$46,136,458 for 1926; for 1925, \$41,038,393.

FINANCE. State expenditure in the year ended June 30, 1927, as reported by the U. S. Department of Commerce, was: for maintenance and operation of State departments, \$23,762,635 (of which \$5,710,371 was aid to local education); for interest on debt, \$763,839; for permanent improvements, \$12,758,777; total, \$37,285,251 (of which \$15,711,805 was for highways, \$5,176,483 being for maintenance and \$10,535,322 for construction). Revenue was \$38,995,736. Of this, property and special taxes formed 35.1 per cent; departmental earnings and charges for officials' services, 9.6 per cent; sales of licenses and taxation of gasoline, 39.8 per cent. Property valuation was \$765,373,554; State taxation thereon, \$5,877,960, intangible property alone being taxed. Net funded State debt on June 30, 1927, was \$26,637,392.

TRANSPORTATION. The total number of miles of railroad line under operation on Jan. 1, 1928, was 4528.15. No construction of additional railroad trackage in 1928 was reported.

EDUCATION. In the course of 1928, there occurred considerable improvement in rural schools in certain respects. The tendency was to raise the standard of qualification for the teachers and to lengthen school terms. The number of pupils having the benefit of a full nine-month term showed an increase. For the year 1927-28, the total of the population of school age was placed at 701,534. There were enrolled in the public schools of the State 553,717 pupils, of whom 490,672 were in the primary schools and 63,045 in the high schools. The total expenditure of the year for public-school education in the State was \$23,741,064. This total included \$2,441,458 of payments on indebtedness. The salaries of all public-school teachers averaged \$827 a year.

CHARITIES AND CORRECTIONS. The State Board of Public Welfare had control or supervision over State and county institutions of care and custody. Among its branches were a division of county and city organization and a division of child care. An associated State agency, the Virginia Industrial School Board, controlled a group of industrial schools. Hospitals for the insane were under separate boards of directors. The State Prison Board had authority over the penitentiary. Among the State institutions were industrial schools at Richmond (girls), Beaumont (boys), Peaks Turnout (colored girls), Hanover (colored boys); hospitals for the insane at Petersburg (colored), Williamsburg, Marion, Staunton; Virginia State Epileptic Colony, at Colony Post Office; State Penitentiary, Richmond. The penitentiary had on Jan. 1, 1928, 2135 prisoners. State sanatoria for the tuberculous were under the oversight of the Department of Health; they were three in number, situated at Catawba, Charlottesville, and Burkeville. The State Diseased and Cripple Children's Hospital was under a separate board of trustees.

LEGISLATION. The State General Assembly convened January 10 in regular session, and adjourned March 10. It extended the previously undertaken reform of the fiscal system by repealing taxes to the total amount of about \$1,400,000, which were judged harmful to State prosperity. The Hall-Parker measures, which were enacted, provided a system of insurance laws and placed the insurance companies under the control of the State Corporation Commission. There were pro-

vided a standard policy, a rate-making bureau, a commission to deal with the subject of compulsory automobile insurance and statutes governing insurance brokers. The law governing the sale of investments, the State "blue sky" law, was amended.

Taxes on railroads were increased by \$100,000 and by compromise legislation railroad interests were induced to withdraw suits attacking the constitutionality of the State franchise tax. The sum of \$1,000,000 was appropriated toward the creation of a Shenandoah National Park. State appropriation for schools was augmented by \$625,000 a year for primary and secondary school operating expenses and by \$3,000,000 for construction of building at institutions of higher learning. A water-power bill was enacted. The Constitutional amendments were repassed and submitted to the popular vote for ratification at a special election. A law was adopted to increase by 1587 miles the extent of the State highway system, thus taking that many miles out of the hands of the counties. An anti-lynching measure and a law to promote aviation and the building of airports were enacted.

ELECTION. The popular vote of the State gave a majority for a Republican presidential candidate, for the first time since 1872, at the election of November 6. The vote for Hoover (Republican) was 164,609; that for Smith (Democratic), 140,146. The Smith vote was approximately of the same size as that cast for Davis in 1924, but a large increase in the total vote apparently went into the Hoover column. United States Senator C. A. Swanson, Democrat, was reelected in spite of the adverse majority on the presidential ticket. Republican candidates, however, captured two seats in the prevailing Democratic delegation of the State to the House of Representatives.

OFFICERS. Governor, Harry F. Byrd; Lieutenant-Governor, Junius E. West; Secretary of the Commonwealth, M. A. Hutchinson; State Treasurer, John M. Purcell; Auditor of Public Accounts, C. Lee Moore; Attorney-General, John R. Saunders; Superintendent of Public Instruction, Harris Hart; Commissioner of Agriculture, George W. Koiner.

Judiciary. Supreme Court of Appeals: President, Robert R. Prentiss; Associate Justices, J. F. West, Preston W. Campbell, R. H. L. Chichester, H. W. Holt.

VIRGINIA, UNIVERSITY OF. A non-sectarian institution of higher education at Charlottesville, Va., founded in 1819. The enrollment for the autumn term of 1928 was 2098, distributed as follows: College, 1147; graduate, 163; education, 107; engineering, 156; law, 285; medicine, 240. For the 1928 summer session, there was an enrollment of 2792. The officers of instruction numbered 290, with 9 in charge of university departments and 28 more in academic schools. The productive endowment of the university amounted to \$10,000,000, the annual State appropriation to \$400,000, and total annual income to \$1,741,352. There were approximately 140,000 volumes in the library. President, Edwin Anderson Alderman, D.C.L., LL.D.

VIRGIN ISLANDS. The name given by the United States Government to the former Danish West Indies, purchased by the American Government from Denmark by the treaty proclaimed Jan. 25, 1917; also a group of islands belonging to the British colony of the Leeward Islands. See **LEEWARD ISLANDS.** The Virgin Islands of the

United States consist chiefly of the Islands of St. Thomas, St. Croix, and St. John, and have a total area of about 132 square miles, with a population, according to the census of Nov. 1, 1917, of 26,051, of which 80 per cent was Negro, 13 per cent of mixed races, and 7 per cent white. St. Thomas, with an area of 28 square miles, had 10,191 inhabitants; St. Croix, 84 square miles, 14,901 inhabitants; and St. John, 20 square miles, 959 inhabitants. St. Thomas, the chief port, has coaling and oil-fueling stations. Education is compulsory. For the fiscal year 1925-26, the trade of the islands was: Imports, \$2,531,404, exports, \$1,119,706. The government of the island is strictly civil. Early in 1927, full American citizenship was granted to the natives of the Virgin Islands. Governor in 1928, Capt. Waldo Evans, U. S. N. (Ret.).

VITAL STATISTICS. The U. S. Bureau of the Census reported that 1,236,949 deaths occurred in 1927 within the death registration area of continental United States, representing a death rate of 11.4 per 1000 population—the lowest since 1900 and compared with 12.2 in 1926. This area in 1927 comprised 42 States, the District of Columbia, and 21 cities in nonregistration States, with a total estimated population on July 1, 1927, of 108,327,000, or 91.3 per cent of the estimated population of the United States.

The principal decreases in death rates in 1927 were: from pneumonia (all forms) from 103 to 81 per 100,000 population, influenza, from 41 to 23, tuberculosis (all forms), from 87 to 81, diarrhea and enteritis (under 2 years), from 27 to 22, nephritis, from 98 to 93, measles, from 8 to 4, and diseases of the heart from 199 to 196. An increase was shown in 1927 in the death rate from automobile accidents, from 18 to 20 per 100,000 population.

The accompanying table on page 799 shows for the death registration area in continental United States in 1926 and 1927 the number of deaths and the death rates per 100,000 population from leading causes.

MORTALITY BY STATES. Of the 41 States which show for both years in the census tables, all but five (Arizona, California, Colorado, Oregon, and Wyoming) had lower rates in 1927. The highest rate in 1927 (13.9) was for California, New Hampshire, and Vermont, and the lowest (7.1) was for Idaho.

Of the 11 States shown by color in 1927, the highest rate for white (11.8 per 1000 population) was for Maryland, and the highest for colored (21) was for Kentucky; the lowest rates for both white and colored were for Arkansas (8.4 and 12.8, respectively). The changes in the death rates of mothers from childbirth, or puerperal causes, was very slight in 1927 as compared with 1926. For the 35 States for which figures were available for 1926 and 1927, the rate from puerperal septicemia was 2.4 per 1000 live births for both years, but the rate from other puerperal causes dropped from 4.1 in 1926 to 3.8 in 1927. Of these 35 States, 14 had higher rates from all puerperal causes in 1927. Florida had the highest death rate in 1927 from all puerperal causes (11 per 1000 live births) and Minnesota the lowest (4.4). Of the 10 States which show by color for 1927, the highest rates for both white and colored were for Florida (9 and 15.7 per 1000 live births, respectively); the lowest rate for white (4.5) was for Kentucky, and the lowest for colored (7.2) was for Maryland.

FROM BUREAU OF THE CENSUS, U. S. DEPARTMENT OF COMMERCE
DEATHS AND DEATH RATES IN UNITED STATES

Cause of Death	Deaths in Registration Area		Rate per 100,000	
	Number	Estimated population	1927	1926

^a Exclusive of stillbirths.

^b Includes tabes dorsalis (locomotor ataxia) and general paralysis of the insane.

^c Includes airplane, balloon, and motor-cycle accidents.

VITAMINS. Hitherto it has been an accepted dictum that the animal must obtain its vitamins from the plant world, but almost simultaneously several investigators—in the University of Copenhagen, Lister Institute (London), and Pennsylvania State College—have arrived at the opposite conclusion, that the B vitamin, at least, may be formed in the alimentary canal of the rat: for although the animal in question is on a vitamin-free diet, yet it does not present any deficiency symptoms and at the same time the B vitamin may be recovered from the intestinal tract. The inference is that, when certain animals are deprived of vitamin, they are capable of forming it from the plant constituents of the food, perhaps by a process similar to that through

which plants are able to form vitamins in nature. See also CHEMISTRY, under *Biological Chemistry*.
NEED OF VITAMINS IN EARLY LIFE. Professor E. Vogt of the University of Tübingen makes a contribution on this subject in the *Klinische Wochenschrift* for Oct. 7, 1928, and has studied especially the newborn child and the nursing. While the vitamin requirement is very great in the young nursing, the newborn child has no immediate need because born with a certain reserve supply taken over from the mother. The need after birth is readily supplied from the mother's milk. The results of depriving human pregnant females of all the known vitamins is not yet known, but in the case of the lower animals tested there is either a disturbance of gesta-

tion or the offspring have development retarded. If pregnant women are fed with foods rich in vitamins, such as cod-liver oil, which guarantees an abundance of vitamins A and D, there is a good outlook for the prevention of habitual abortion, while the intrauterine development of the fetus is favored. The maternal colostrum is of great value for the newborn for it is richer in vitamin than the subsequent milk. The milk, butter, and milk products in general of the grazing animals are characterized by a maximum amount of vitamins. The author favors the use by all pregnant women throughout gestation of ultraviolet-rayed cod-liver oil or levurinose, both rich in vitamins. See **CHEMISTRY, INDUSTRIAL; FOOD and NUTRITION.**

VOLUNTEERS OF AMERICA. A non-sectarian philanthropic organization founded by General and Mrs. Ballington Booth, in March, 1896. The society was incorporated on Nov. 8, 1896, under the laws of the State of New York. The society works in harmony with the evangelical churches. No pledge of life membership is required of its members; it promotes its officers on a merit system; its funds are audited at stated periods and balance sheets are issued. The society has over 60 homes or institutions throughout the United States. There are summer camps to the number of 14, and the society owns the property and equipment of most of these. The winter activities of the society embrace all branches of relief work in a number of cities, in conjunction with the gospel mission work. The following record gives some idea of the work accomplished during 1928: There were 133 stations, of which 127 were in urban communities and six in rural areas. There were Sunday schools in connection with 80 stations, reporting 9942 scholars. The indoor meetings for the year numbered 18,428 and those conducted outside were 11,273, making a total of 29,701. The combined attendance at these gatherings was 2,660,288. Employment was furnished 45,824 persons. Meals were given free to 924,377, while 467,837 meals were paid for in cash or by work. Lodgings furnished free numbered 220,017 and beds were given in exchange for work and cash to 234,250. The families visited numbered 80,840. Transportation was given to 14,068 and garments and shoes to 202,523. Thanksgiving and Christmas dinners were supplied to 137,791.

VON NEMES, COLLECTION. See **ART SALES.**

WAGES, INDEX NUMBER OF. See **STATISTICS.**

WAHL, LUTZ. Adjutant general of the U. S. Army, died at Washington, D. C., December 30. Born at Milwaukee, Wis., Nov. 2, 1869, he was graduated from the U. S. Military Academy in 1891, and commissioned second lieutenant in the Infantry on June 12 of that year. Rising through the successive grades, General Wahl served in the Philippines during the insurrection of 1898, and again was stationed on the islands in 1903 and 1908. In addition to his field service, he was in the commissary department in the Philippines, and at Fort Monroe, Va., and was assistant superintendent of the Army Transport Service. Having been graduated from the Army War College in 1916, General Wahl commanded the Eighth Infantry of the Fourth division when the United States entered the World War,

but in February, 1918, he was stationed in Washington for a short time at the head of the operations division of the general staff. By Apr. 12, 1918, however, he was commissioned brigadier general, returned to the line, and commanded the Fourteenth Infantry Brigade until Oct. 31, 1919. Returning to Washington, he was graduated from the General Staff School in 1921, and detailed to the Adjutant General's Department becoming, May 16, 1924, Assistant to the Adjutant General and July 2, 1927, was made Adjutant General of the Army. General Wahl was awarded the distinguished service medal for his work during the World War.

WALES. A historical division of the United Kingdom, consisting of 12 counties, on the west coast of Great Britain, between the Irish Sea on the north and the Bristol Channel on the south. Area, 7466 square miles; population, according to the census of 1921, 2,205,680. See **GREAT BRITAIN.**

WALKER, THOMAS BARLOW. American lumberman, art collector, and philanthropist, died at Minneapolis, Minn., July 28. He was born at Xenia, Ohio, Feb. 1, 1840. While supporting himself and his family by selling grindstones to farmers, he studied at Baldwin University (now Baldwin-Wallace College), at Berea, Ohio. At the age of nineteen, he began his long and very successful career in the lumber business by buying a piece of timber land at Paris, Ill., and contracting to supply the Terre Haute & St. Louis R. R. with ties and other lumber. The business was growing when the railroad failed, and Walker taught school until he went to the Northwest three years later as a member of a crew sent out by the St. Paul & Pacific R. R., now the Great Northern, to examine the land grants of the road. The knowledge he gained then proved advantageous when he organized the Red River Lumber Company in 1882, and he became eventually the largest timber-land operator in the Northwest and one of the greatest in America, with holdings in Minnesota and California. They brought him a fortune estimated at \$100,000,000 several years before he died. Mr. Walker was one of the pioneer builders of the City of Minneapolis, in which he lived for sixty years, and was probably its greatest benefactor. He gave the city its public library and the Walker Art Galleries. The latter contain specimens of the work of some of the world's most famous artists, ancient and modern, valued at more than \$5,000,000. He also was mainly instrumental in the building up of the Minneapolis Academy of Science and its museum of science and art. Baldwin College conferred on Mr. Walker the honorary degree of LL.D. He was a leading advocate of the policy of conserving the forests for perpetual use. He was a member of the International Committee of the Young Men's Christian Association, the American Economic Association, the American Forestry Association and other societies.

WANAMAKER, (LEWIS) RODMAN. American merchant, died at Atlantic City, N. J., March 9. He was born at Philadelphia, Feb. 13, 1863, the son of the late John Wanamaker, merchant and at one time postmaster-general of the United States. Rodman Wanamaker (who discarded his first given name, Lewis, early in life) was graduated from Princeton University in 1886, and from that time was associated in business with his father in the management of the retail establishments in Philadelphia and New York. He was

resident manager in Paris for ten years. He was also a director and official of many financial institutions. He became head of the Wanamaker interests on the death of his father in 1922. For several years he acted as consul general at Philadelphia for Paraguay and other South American countries. Mr. Wanamaker financed three expeditions to the West to study Indian life, and presented their collections to the Federal Government. He also presented an art collection to Princeton University. During the World War, Mr. Wanamaker served as chairman of the mayor's committee in New York to welcome homecoming troops, and he was also chairman of the mayor's committee on public welfare and of the committee on the reception of distinguished guests. He was a leader in numerous civic and philanthropic movements. He presented to New York the perpetually burning light and altar of liberty, in Madison Square, as a memorial to the American dead in the World War. In his later years, he devoted much time and money to the advancement of aviation. He received decorations from the governments of Great Britain, France, Italy, Belgium, Serbia, and Venezuela.

WARWICK, EARL OF. (LEOPOLD GUY FRANCIS MAYNARD GREVILLE). English soldier, died at Hoe, England, January 31. He was born Sept. 10, 1882, and was at Eton when the Boer War began. He was then known by the "courtesy title," Lord Brooke. He could not get parental consent to join the colors, so he sold his gun and his fur coats for funds to get to South Africa. There he was attached to the staff of Sir John French as a galloper. Having received a commission in the First Life Guards, he saw active service in the war, winning the Queen's Medal with four clasps. Later he served as aide-de-camp to Lord Milner. During the Russo-Japanese War, 1904-05, he followed the operations of the Russian Army as a correspondent for Reuters, and later wrote a book on his experiences. In 1908 he was appointed aide-de-camp to Sir John French, inspector general of the British Army, and in 1913 was chosen to command the Second Canadian Cavalry Brigade. When French became chief of the Imperial General Staff, he made Lord Brooke his secretary. The latter went to the front in 1914 as aide-de-camp to French, and later commanded the Fourth and Twelfth Canadian Infantry Brigades, with the rank of brigadier general. He was wounded in 1915, was mentioned in dispatches, and was made a Companion of the Order of St. Michael and St. George. He received various foreign orders also. Lord Brooke served also as liaison officer with the American Army. In 1924 he succeeded his father as Earl of Warwick, being the sixth holder of the title, of the present creation.

WASHINGTON, WILLIAM HENRY. American clergyman, bishop of the United Brethren Church, died at Dayton, Ohio, May 18. He was born at Greystone, Pa., Sept. 9, 1862. He was educated at Lebanon Valley College, 1891, and was pastor of a church at Harrisburg, Pa., 1890-94. In that year he was ordained in the ministry of the United Brethren Church and became pastor of

a congregation at Chambersburg, Pa., where he remained until 1902. From 1902 to 1917 he was superintendent of the Pennsylvania Conference of the Church, and then became bishop of the Pacific District, with his seat at Portland, Oreg. He lectured on social, economic, educational, and religious topics, and wrote *City Evangelization* (1906). Bishop Washington was a vice president of the Federal Council of Churches of Christ in America.

WASHINGTON. POPULATION. According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 1,356,621. The estimated population on July 1, 1928, was 1,587,000. The capital is Olympia.

AGRICULTURE. The following table gives the acreage, production, and value of the principal crops in 1927 and 1928:

Crop	Year	Acreage	Prod. bu.	Value
Wheat	1928	2,271,000	48,644,000	\$48,620,000
	1927	2,261,000	58,436,000	62,971,000
Hay	1928	937,000	2,186,000 ^a	28,434,000
	1927	962,000	2,369,000	30,425,000
Apples	1928	33,500,000	30,150,000
	1927	25,343,000	32,946,000
Potatoes	1928	67,000	9,045,000	4,522,000

^a tons.

MINERAL PRODUCTION. The production of coal, the chief component of the mineral total of the State, was steady in 1927. There were mined 2,635,052 net tons, as against 2,586,568 in 1926; in value, \$9,222,000 for 1927 and for 1926, \$9,350,000. The by-product coke production of 1927 was 41,000 short tons, and that of 1926, 42,584 tons, valued at \$303,624. Beehive-oven coke totals were not available for 1927; for 1926 they were: quantity, 24,702 short tons; value, \$214,429. To Washington may be ascribed much the greater part of the cement shipments of 3,605,103 barrels in 1927 and 3,113,083 barrels in 1926 listed as from that State and Oregon; these had a value, for 1927, of \$7,736,933 and for 1926 of \$6,742,667. The clay products of the State of Washington attained \$2,583,333 for 1926 and \$2,619,250 for 1925. There occurred a sharp rise in the production of gold, the quantity for 1927 being 19,514 fine ounces, as against 9341 fine ounces in 1926. Three-fourths of the total for 1927 came from Ferry County. Production of other metals was: silver, 1927, 155,850 fine ounces, 1926, 171,649; copper, 1927, 1,685,843 pounds, 1926, 1,351,890; lead, 1927, 955,003 pounds, 1926, 4,546,228; zinc, 1927, 1,279,710 pounds, 1926, 1,044,354. The total value of the year's product of these five metals was \$854,659 for 1927 and for 1926, \$931,491. The State was again the chief source of magnesite, furnishing 77,740 short tons in 1927 as against 79,560 in 1926; in value, \$583,050 in 1927 and \$596,700 in 1926. The total value of the State's mineral products was \$21,256,952 for 1926; for 1925, \$22,382,132.

The 1928 production of gold was \$334,000; that of silver, 94,000 ounces; copper, 1,121,000 pounds, in value \$163,000; lead 1,180,000 pounds, \$72,000. Zinc mills were almost entirely closed down and production was but 26,000 pounds.

FINANCE. State expenditures in the year ended Sept. 30, 1927, as reported by the U. S. Depart-

ment of Commerce, were: for maintenance and operation of governmental departments, \$22,921,765 (of which \$9,683,539 was aid to local education); for interest on debt, \$716,615, for permanent improvements, \$11,116,449; total, \$34,754,829 (of which \$9,556,931 was for highways, \$2,585,305 being for maintenance and \$6,971,626 for construction). Revenue was \$35,622,467. Of this, property and special taxes formed 48.3 per cent; departmental earnings and charges for officials' services, 6.6 per cent; sales of licenses and taxation of gasoline, 34.5 per cent. Property valuation was \$1,216,089,557; State taxation thereon, \$13,792,277. Net State funded debt on Sept. 30, 1927, was \$12,911,977.

TRANSPORTATION. The total number of miles of railroad line under operation on Jan. 1, 1928, was 5556.92. There were built in 1928, 19.37 miles of additional first track.

EDUCATION. The movement toward the consolidation of schools into larger units was marked in 1928, according to State Superintendent J. C. Preston, in the *Journal* of the National Education Association, 61 consolidations being effected by popular vote in the course of the year; of these, 14 joined districts previously separated by county borders. Twenty-nine counties qualified as to the State standard set up for their public schools. The school population as estimated for the academic year 1927-28 was 425,764. There were enrolled in the public schools in that year 339,001 pupils, not to count an evening school enrollment of 13,001. Of the day pupils, 257,990 were in the elementary grades, 2774 in kindergartens and 78,237 in high schools. Expenditures for public-school education in the year were: current, \$26,237,518; interest on debt, \$1,557,327; outlay, \$4,471,005. Salaries of teachers averaged \$1908 for men and \$1430 for women.

CHARITIES AND CORRECTIONS. The State conducts some 12 independently managed institutions for the care or custody of individuals. These are the State School for the Deaf, Vancouver; State School for the Blind, Vancouver; State Training School, Chehalis; State School for Girls, Grand Mound; State Soldiers' Home, Orting; Washington Veterans' Home, Retsil; Western State Hospital, Steilacoom; Eastern State Hospital, Medical Lake; Northern State Hospital, Sedro Woolley; State Penitentiary, Walla Walla; State Custodial School, Medical Lake; State Reformatory, Monroe.

POLITICAL AND OTHER EVENTS. The new administration building of the State capital group at Olympia was completed and was opened for regular use March 28. Its cost was stated to be \$7,350,000. Governor Hartley, in an address at the opening, characterized it as "a monument to extravagance in design and waste and profligacy in furnishings." The alien land law of the State was sustained April 23 by the U. S. Supreme Court in a decision in harmony with the findings of the State courts, against the efforts of a Japanese to hold land on the White River near Seattle, in the name of a corporation. The preliminary bore for the construction of the tunnel of the Great Northern Railway system through the Cascade Mountains was holed through May 1, by a blast set off electrically by President Coolidge at the White House. The tunnel, when complete, was to cost \$16,000,000, and to be 7.79 miles in length, the longest in the Western Hemisphere.

Teachers in the schools of Seattle formed a trade union affiliated with the American Federa-

tion of Labor, a course to which the school board of the city was opposed. The board accordingly imposed on teachers as a qualification for employment a declaration that the declarant was not a member of the American Federation of Teachers or of any of its locals, and would not become a member while under employment contract. The teachers' organization carrying the matter to the State courts was finally, in July, refused an injunction by the Supreme Court of the State, confirming a lower court, which had laid down the principle that public-school teaching was of a public character, and under absolute control of the State. Construction of the Medico-Dental Building, an office building in Spokane, 15 stories in height and to cost about \$1,000,000, was begun in July. Tacoma, according to report of July 3, by an offer of electric power at the extraordinarily low rate of 1½ mills a kilowatt-hour from its municipal power plant, secured the location in the city of a \$2,000,000 chemical manufactory.

ELECTION. The vote of the State in the election of November 6 was mainly Republican. On the National ticket, Hoover and Curtis (Republican) received 335,844 votes; Smith and Robinson (Democratic), 156,772. Senator C. C. Dill, Democrat, however, was reelected to the United States Senate for the ensuing regular term, defeating Kenneth Mackintosh, Republican. The political complexion of the State's delegation to the House of Representatives remained the same; four Republican incumbents were reelected. Governor Roland H. Hartley, Republican, was reelected, defeating Scott Bullitt, Democrat. John A. Gallatly (Republican) was elected Lieutenant-Governor. Other officers elected, all Republican, were: J. Grant Hinkle, Secretary of State; Charles W. Hinton, State Treasurer; C. W. Clausen, Auditor; John H. Dunbar, Attorney-General; N. D. Showalter, Superintendent of Public Instruction.

OFFICERS. Governor, Roland H. Hartley; Lieutenant-Governor, W. Lon Johnson; Secretary of State, J. Grant Hinkle; Treasurer, W. G. Potts; Auditor, C. W. Clausen; Attorney-General, John H. Dunbar; Superintendent of Public Instruction, Josephine Corliss Preston.

JUDICIARY. Supreme Court; Chief Justice, Kenneth Mackintosh; Associate Justices, Emmett N. Parker, Mark A. Fullerton, John R. Mitchell, O. R. Holcomb, Warren W. Tolman, John F. Main, William D. Askren, Walter French.

WASHINGTON, UNIVERSITY OF. A State institution of higher education at Seattle, Wash., founded in 1861. The enrollment for the autumn term of 1928 was 7282, of whom approximately 58 per cent were men. The summer-school enrollment totaled 3057 in the two terms, including 2019 women and 1038 men. The faculty, on November 1, consisted of 350 members. The courses offered at the University in 1928-29 were: Business administration, education, engineering, fine arts, fisheries, forestry, journalism, law, liberal arts, library science, mines, pharmacy, science, and graduate work. The income from all sources for the scholastic year 1927-28 was \$2,917,462. The library contained 249,208 volumes. President, M. Lyle Spencer, Ph.D.

WASHINGTON AND JEFFERSON COLLEGE. A non-sectarian institution for the higher education of men at Washington, Pa., founded in 1802. The enrollment for 1928-29 totaled 499,

of whom 12 were graduate students; 101, seniors; 92, juniors; 127, sophomores; and 167, freshmen. The 1928 summer session had a registration of 242. There were 40 members on the faculty. The productive funds of the college amounted to \$1,441,128, and the income from all sources during the year was approximately \$207,042. The library contained 40,763 volumes. President, S. S. Baker, M.S., LL.D.

WASHINGTON AND LEE UNIVERSITY.

A non-sectarian institution for the higher education of men at Lexington, Virginia, founded in 1749. The enrollment for the autumn of 1928 was 910. There were 56 members on the faculty. The productive funds of the University amounted to \$1,390,047, and the income for the year was \$339,396. The library contained 65,000 volumes. President, Henry Louis Smith, Ph.D.

WASHINGTON BICENTENNIAL. See CELEBRATIONS.

WASHINGTON UNIVERSITY. A non-sectarian institution of higher learning for men and women at St. Louis, Missouri, founded in 1853. The enrollment on November 1, was 6669, distributed as follows: Graduate students, 226; college of liberal arts, 1514; engineering, 411; architecture, 111; business and public administration, 183; law, 182; medicine, 329; dentistry, 195; fine arts, 354; extension division, 2902; nursing, 262. The faculty for 1928-29 numbered 541, including 89 professors, 45 associate professors and 82 assistant professors. Among the new appointments were those of Dr. Albert Hayes Sharpe, professor of physical education and director of the University health service; Dr. Harvey James Howard, professor of ophthalmology; Dr. Lee Wallace Dean, professor of oto-laryngology; Dr. Edmund Vincent Cowdry, professor of cytology; and Dr. Jacques Jacob Bronfenbrenner, professor of bacteriology and immunology. The value of the buildings, grounds, and equipment of the institution was estimated at \$8,839,101; the endowment was \$13,802,548; and the income for the year was \$2,788,491. The library contained 285,654 volumes and 78,386 pamphlets. Gifts received in 1928 amounted to \$686,444, in addition to which, \$600,000 was received for the George Warren Brown Department of Social Work in the school of business and public administration. A woman's building and a school of dentistry building were completed during the year. Acting Chancellor, George R. Troop, Ph.D.

WATER POWER. The year 1928 witnessed a perceptible slowing down in the number of water-power developments projected in the United States. This was due to several factors, chief among which was that most of the more favorably located sites had been developed; there was a realization that the increased operating efficiencies of steam plants had enabled them to compete successfully with all save a few low-cost hydro plants; and certain political aspects had held up two or three of the remaining large projects. Of the latter, the bill affecting the Boulder Dam on the Colorado River was passed by Congress and signed by the President during the last few days of the year. This would involve a potential capacity of a million horse power.

Another, the proposed St. Lawrence development, still was awaiting an equitable agreement between the Federal Government, the State of New York, and Canada. Additional diversion of water at Niagara Falls seemed assured in that negotiations had been consummated between the

Canadian and the United States governments which provide for the construction of remedial works that will retard recession of the Falls and preserve their beauty, at the same time making available an additional 20,000 cu. ft. per sec. on each side for power purposes. This represents over a million additional horse power. The programme will have to be ratified by Congress and by the Canadian Parliament before being put into effect.

In spite of the fewer developments projected, energy from water power had assumed a larger rôle in meeting the demands of the United States. Of the total central-station power generated during the year, hydro plants supplied about 43 per cent, or 36 billion kilowatt-hours, compared with 14 billion kilowatt-hours in 1920. This was due to several large plants having gone into operation, to more efficient use of existing water-power capacity made possible by system interconnection with steam stations, and to higher efficiencies attained through improved designs of the hydro plants themselves and their equipment.

In 1908 there was about 10½ million horse power of hydro capacity installed in central stations in the United States, exclusive of a large number of scattered and smaller developments supplying mills and factories direct.

Among the more important plants that went into service during the year, the Conowingo development on the Susquehanna River was outstanding. At the end of the year, this contained seven 54,000-horse-power units operating under a 90-foot head. In physical dimensions, they were the largest yet constructed in the United States, although in capacity they did not equal the 70,000-horse-power units installed several years previously at Niagara Falls. The Conowingo development is a part of the system of the Philadelphia Electric Company which is tied in with that of the Public Service Electric Company of New Jersey and the Pennsylvania Power and Light Co. This large interconnected system of hydro and steam plants serves eastern Pennsylvania and the whole of the State of New Jersey. The electrification of the Pennsylvania Railroad from New York to Wilmington announced during the year was to be supplied by this system. See DYNAMO-ELECTRIC MACHINERY.

For high-head plants, another record was established in Big Creek 2A of the Southern California Edison Company, where two 58,000-horse-power units have been put in, operating under a head of 2418 feet.

During the year, the Rocky River Development of the Connecticut Light & Power Company went into service. This was the first in the United States to operate on pumped water which is forced up into a large reservoir by electric-driven pumps operated during off peak periods by power generated in a steam station of the company. The Rocky River plant contains one 33,000-horse-power vertical shaft water wheel operating under a 240-foot head. The water is pumped up to the reservoir by two 8100-horse-power pumps.

Another plant that went into operation during the year was the Norwood development of the Carolina Power & Light Co., which contains three units totaling 88,000 horse-power under a 70-foot head. Incidentally these units are of the outdoor type. A record low-head plant which went into service during the early part of 1928 was that

on the Ohio River at Louisville, Ky., which contains eight 13,500-horse-power units, operating on a head ranging from 37 to 10 feet.

Work was progressing on the "Fifteen Mile Falls" development of the New England Power Association on the upper waters of the Connecticut River at Barnet, Vt., and at Monroe, N. H., where a combined capacity of 300,000 horse power was to be made, available in the ultimate development. The first section was to be completed in the fall of 1930.

The total capacity of water wheels installed in water-power plants of 100 horse power or more in the United States on Dec. 31, 1928, was 13,571,530 horse power, an increase of 1,275,530 horse power, or 10.4 per cent, during 1928. The increase in 1927 was only 575,000 horse power. The gain in 1928 was therefore more than twice that during 1927. The accompanying table shows the total capacity of water-power plants in the United States at different dates and the increase between dates:

Date	Horse power	Increase Horse power
1921 (November)	7,926,958	
1924 (March)	9,086,958	1,160,000 ^a
1925 (March)	10,037,655	950,697
1925 (December 31)	11,176,596	1,138,941 ^b
1926 (December 31)	11,730,983	554,387
1927 (December 31)	12,296,000	575,017
1928 (December 31)	13,571,530	1,275,530

^a About 2.3 years.

^b About 0.8 year.

In Canada water power continued to be active because it still had a decided advantage over fuel which is more expensive. One of the projects under construction was to have four 75,600-horse-power units. This is the Chute-a-Caron development of the Alcoa Power Co. on the Saguenay River. In Europe, France was giving much attention to development of her water power in the South in a comprehensive plan to meet industrial demands for electricity. Under this plan, water power will supply about half of France's electrical demands. Italy is another country that was active in water-power development owing to the absence of native coal. Certain of these projects were being undertaken in conjunction with the development of irrigation projects.

A most unique hydro development involving over 100,000 ultimate kilowatt capacity was being built by Japan in the mountains of Northern Korea. The western slope of this range is gradual and contains rivers, whereas the eastern slope is very steep and has no streams. Accordingly, a large reservoir was being constructed on the Western slope in which water from the streams will be impounded. This water will be conducted through a 16-mile tunnel to the eastern side of the range and a head of 3326 feet utilized. Japan was actively carrying on other hydro developments in Formosa.

See DYNAMO-ELECTRIC MACHINERY.

WATER PURIFICATION. Water-borne typhoid epidemics, rare for some years past, occurred at Olean, N. Y., and St. Leonard, N. B. (Canada), during the year. The Olean outbreak, with 227 cases and 20 deaths up to December 15, was due to a break in a water main beneath a river, which admitted polluted water to a supply from wells, used in case of emergency. The temporary supply was chlorinated, but the requisite daily tests to show whether sufficient

chlorine was being applied were not made, and enough chlorine to cope with the pollution was not used. Had the tests been made, they would have shown not only that more chlorine was needed for disinfection but also that the supply was being polluted, thus warning of danger. At St. Leonard, 200 cases of typhoid and 7 deaths were attributed to cases of the disease in a family living on the gathering grounds from which the water supply of the village is taken. Infection of this family was believed to have been caused by the temporary use of polluted water from the St. John River. Damages of \$3000 against the City of Albany, N. Y., were awarded in 1928 for a case of typhoid in 1924 alleged to have been caused by polluted water gaining access to a steel pipe laid in the bed of the Erie Canal and carrying filtered water to the city. This main was being replaced. The Appellate Division of the Supreme Court of New York upheld a jury award in the trial court. Eighty other damage suits were pending when the decision was rendered.

Among books in this field published during the year were: Ellms, *Water Purification*, revised edition (New York), and Gross, *Handbuch der Wasserversorgung* (Munich and Berlin). See WATER SUPPLY; MUNICIPAL OWNERSHIP; and TUNNELS; TYPHOID FEVER.

WATER SUPPLY AND WATERWORKS.

While no great new enterprises were placed under construction during the year, several important works were nearing completion, several new projects were considered, and contracts were let for a second great distributing tunnel in New York. Perhaps the most interesting new development in aqueduct design was the use of arc-welded steel pipe in two new supply systems. Indeed the use of steel pipe for main distributing conduits was itself somewhat of a novelty having been introduced in the Brooklyn extensions from shafts Nos. 23 and 24 of the Catskill supply of New York City to outlying districts in Flatbush and for the connections to the No. 2, 42-inch cast-iron siphon across the Narrows, a few years previously.

It would appear that the water supply problem was still to be met by securing additional supplies through works of constantly increasing magnitude rather than by any very widespread and determined efforts to reduce waste. Chicago, for example, with a consumption of over 250 gallons per capita daily, at least half of which was unnecessary and avoidable waste, was unable to put through legislation to secure thorough metering of the supply and was going forward with a new intake crib and tunnel. In New York, although the consumption was probably not unreasonable for a great city (about 125 gallons per capita per day), careful estimates showed that even with the great Catskill supply there would be an urgent need for additional water by 1935, and plans for a new supply and new aqueduct were rapidly crystallizing. Smaller cities were in general following the same course. St. Louis and Kansas City, for example, had extended their supplies and the latter had built a most interesting filter plant. The water supply problem, therefore, promised to be an important American engineering problem for many years to come, although in Europe it had reached a more or less stable position with minor improvements and consolidations the usual type of work.

NEW YORK CITY. As already noted it was expected that there would develop an urgent need for more water than the Croton and Catskill systems can supply, by 1935. Plans for an additional supply from tributaries of the Delaware River, in New York State, and from Rondout Creek were recommended in 1927. The New York City Board of Estimate and Apportionment had approved these plans, and in 1928 surveys and borings were under way, but no steps had been taken toward acquiring property, etc. pending an opinion from Judge Charles E. Hughes, who had been retained by the City, on the legal aspects of the diversion of water from the Delaware River, because it is an interstate stream.

The plan as announced contemplated building five reservoirs on tributaries of the Delaware directly west of the Catskill area and estimated to be capable of supplying 600 m. g. d. (million gallons daily). A reservoir on Rondout Creek, south of Ashokan Dam, was figured as a source of 100 m. g. d. and a new aqueduct was planned running eastward from the Delaware area to Rondout and crossing under the Hudson to the high-level West Branch reservoir in the upper Croton watershed. This would make available an additional supply from the upper Croton, which was passing to the Croton system, a low-level or low-pressure supply, at the higher Catskill level. The combined supplies would then be brought southward by a new aqueduct to Kensico and Hill View reservoirs. This plan in cost and magnitude was believed to exceed the great Catskill supply and aqueduct of 1917. See *Eng. News-Record*, Aug. 11, 1927.

Contracts also were let for duplicating the deep distribution tunnel built under the city as part of the Catskill system. Tunnel No. 1 passes southward from Hill View Reservoir down Manhattan Island and under the East River to Fort Greene Park, Brooklyn. The new tunnel, No. 2, will turn southeast from Hill View under the Bronx, crossing to Queens under Randall's Island and continuing to meet No. 1 at Fort Greene Park. As in the case of tunnel No. 1 this new distributing main will be 250 to 700 feet below ground surface, deep in solid rock. From its various shafts, connections were to be made to the regular cast-iron distributing mains in the city streets. The tunnel was to be 17 feet in diameter and cost \$42,693,000 and was to furnish a supply to the rapidly growing sections through which it passes.

LOS ANGELES, CALIF. Almost a million dollars had been expended in making surveys and plans for what promised to be the longest and largest aqueduct in the world, which was to connect the city with the Colorado River. To be designed for 970 m. g. d. and to be almost 300 miles long, it was expected that this huge work would solve Los Angeles' water problem for 50 years to come. Final action on the project was expected in the near future.

SAN FRANCISCO. Construction of the long-awaited Hetch Hetchy project was still under way in 1928, and it was expected that the supply would reach the city by 1932. The upper section including the O'Shaughnessy Dam in Yosemite Park and the aqueduct to the Moccasin power plant had been finished for some time and was bringing some \$2,000,000 a year in power sales. The San Francisco Bay section was also completed, while the Coast Range tunnels were prac-

tically finished at the end of the year and bonds issued for the last link—the 45 miles of steel pipe across the San Joaquin Valley.

MOKELUMNE PROJECT. This work, which was to supply water from the Mokelumne River through a 95-mile conduit to cities on the east side of San Francisco Bay, was still under construction, having been delayed by legal difficulties connected with real estate for the upper-tunnel section and reservoir construction. The work had attracted much attention as it consisted in large part of a 65-inch steel pipe line which had been built by electric welding. Although this was the first line so constructed, it was followed in 1928 by a six-mile supply line of 48- to 54-inch size for Springfield, Mass. In both cases the pipe was made in 30-foot lengths with longitudinal welded joints only. Transverse joints were made by riveting after experiments with welding had failed to give satisfactory results.

BOSTON. Work was being pushed on the extension of the Metropolitan supply westward into the Swift and Ware rivers to meet the urgent requirements for additional supply. Indeed temporary works had been installed pending the completion of the first 14 miles of tunnel, under construction in 1928 which would carry flood flows of the Ware into the existing Wachusett Reservoir on the Nashua watershed of the Boston Metropolitan Water System. The ultimate plan involved an extension of the tunnel to a total length of 25 miles with a reservoir on the Swift River in which the waters of both the Ware and the Swift were to be collected. The cost of the project was estimated at \$65,000,000.

WANAUKE SUPPLY. The eight north Jersey cities, which had combined in the North Jersey District Water Supply Commission, appeared still to be deadlocked on the relative advantages and disadvantages of the various schemes proposed for aerating the supply from the completed Wanaque Dam and delivering it by aqueduct. It would appear that the high-level cities were afraid the loss of head in aeration might cause a lack of pressure in the supply system, while the lower-level cities naturally had no such doubts. Fortunately, a compromise was effected and the construction of this great and much-needed supply was to be continued.

CHICAGO. The steel base for the new intake crib was successfully launched during the summer. It is 90 feet in bottom diameter and 45 feet high. In the new plans for this supply to the northern part of the city, a new 3-mile tunnel to connect with the intake was being driven deep in the rock below Lake Michigan as had been done in the more recent Chicago works. It was planned to extend this tunnel some 12 miles in length under the city and thus use it as a main distributor from which the supply may be pumped.

Many complaints continued to be heard, during the year, of the bad quality of the Chicago water, which is heavily treated with chlorine for sterilization against its heavy pollution. A phenol taste was said to be particularly noticeable at times and the combination of taste of polluted water and chlorine was said to be far from pleasant. Chicago, however, apparently was determined not to filter her supply but was taking steps to prevent, if possible, the pollution of her source, Lake Michigan, by other cities on its shores. Chicago's wastes pass through the Drainage Canal to the upper Mississippi area and

this diversion of water also was still a pressing economic and legal question yet awaiting final settlement.

MONTREAL. In Canada, Montreal completed the purchase of the property of the Montreal Water and Power Company, which supplied a part of the city and considerable outlying territory. Montreal had built a new low-level pumping station with a capacity of 180,000,000 Imperial, or 216,000,000 U. S. gallons, in six units of equal size. This station was to deliver water to the old, and also to a new filtration plant, with nominal capacities of 50,000,000 and 100,000,000 Imperial, or 60,000,000 and 120,000,000 U. S., gallons.

WEEVIL. See ENTOMOLOGY, ECONOMIC.

WEISS, vâ'is, ANDRÉ. French vice president of the Court of International Justice at the Hague, died September 5. He was born of Jewish parents at Mülhausen, Alsace-Lorraine, Sept. 30, 1858, and having studied law at Paris, he was admitted to the bar in 1880, practicing at the Court of Paris. He lectured on the law faculty at Dijon, 1881-91, and at the University of Paris, 1891-96, where he was professor of civil law, 1896-1908, becoming professor of public and private international law in 1908. He represented the French Government before the Hague Court in 1909 and 1911. Being sent as technical councillor in 1919, he became a member of the Court of Permanent Arbitration at the Hague. He also acted as legal adviser for the Ministry of Foreign Affairs, and was elected vice president of the Court of International Justice. He was president of the Institute of International Law and the International Academy of Comparative Law at Geneva. M. Weiss wrote a number of highly esteemed articles and books, including: *Étude sur les conditions de l'extradition* (1880); *Traité élémentaire de droit international privé* (1885); *Traité théorique et pratique de droit international privé* (1892-98, second edition, 1907-13); *Le droit civil et la législation comparée* (1900); *Manuel de droit international privé* (1905); and *Le code civil et le conflit des lois* (1906).

WELDING, ELECTRIC. See BRIDGES; ELECTRICAL INDUSTRIES.

WELFARE WORK. A leading authority in the United States on old-age pensions, Abraham Epstein, in an article in *Current History* for June, analyzes the great expenditure annually on social work as a result of private effort. He points out that probably from \$500,000,000 to \$650,000,000 is being spent each year by private social workers on current expenses exclusive of the capital outlay. In New York City alone 1200 or more private welfare agencies were spending annually \$75,000,000 or a per capita expenditure of \$12.60. In 1924, social-welfare agencies in 19 cities, all but one of which had populations under 1,000,000, spent \$112,780,524. All this is being done not to do battle with poverty or in the interests of social justice but in the name of a social-work technic. "His (the social worker's) prescriptions are no longer compounds of social panaceas and far-visioned dreams, but of all the new discoveries of psychology, psychiatry, and the science of case work. The questions of a living wage, abolition of the slums, woman and child labor, the lack of economic opportunity, the insecurity of life, and so forth no longer attract

him. His new faith proclaims the inequality of human beings and he believes that 'to get socially helpful results, we have to do different things for different people.'"

Mr. Epstein attacks the prevailing lethargy of social workers in their refusal to lead the fight for social betterment and the eradication of those insecurities that have become part and parcel of our modern industrial life, to wit, illness, unemployment, invalidity and old age. The author advances these reasons for the "soullessness of present-day social work": 1. Executive jobs are paying good salaries and are attracting persons not fired by enthusiasms but who can master the elaborate technic necessary. 2. Centralization through community chests makes the chief problem that of money raising. 3. Social work is being supported by the contributions of the wealthy and the social worker cannot very well forget that. 4. There is a high rate of turnover among the staff social workers. 5. Because of the intricacy of the organizations, the executive cannot be in personal contact with the dependent persons it is his business to serve.

FRENCH SOCIAL INSURANCE LAW. Mr. Epstein is one of a few persons who appreciate that modern industrial life demands more than the palliative measures that private social work is willing to countenance. There exist in England, Germany, Russia, and France elaborate social insurance codes whose purpose is to cope with the prevailing problems of illness, unemployment, invalidity, and old age which have, in effect, been brought in the train of the mechanization of society. France joined the ranks of other enlightened European countries when, on April 5, a decree was passed announcing the inauguration of a social insurance system which has sickness, unemployment, premature invalidity, old age, maternity, and death features. Insurance is compulsory for all employed persons of both sexes whose incomes do not exceed 18,000 francs annually. The insurance funds are to be maintained by contributions from the employer, the worker, and the State. Insured women are to receive medical attention during pregnancy and for six months following. The law is to go into effect within 10 months after the issuance of the regulations necessary for its administration and these regulations must be issued within the year.

CONFERENCES. The fifty-fourth annual session of the *National Conference of Social Work* was held May 2-9 at Memphis. It is impossible to do more than record the extraordinary activity that characterizes this gathering which has, in effect, become a meeting of technicians every whit as incomprehensible to the layman as the conferences of biologists or mechanical engineers. The following were the division meetings with the subjects of leading interest indicated: "Child Care"—Undifferentiated case work. "Health"—Changing status of the causes of sickness and death. "The Family"—A symposium on financial dependency and relief giving. "Industrial and Economic Problems"—Industrial problems of the South. Workmen's compensation and the family. "Neighborhood and Community Life." "Mental Hygiene." "Organization for Social Forces"—Organizing the community for legislative reform. Fact-finding and research as a basis of programme making in social work. "Public Officials and Administration." "The Immigrant." "Professional Standards and Education." "Educational Publicity." The programmes listed 325 speakers and

discussion leaders with one expert making five appearances and one making four. There were 2500 delegates present. Porter R. Lee of New York was chosen the president of the Conference for 1929 and San Francisco was named as the meeting place.

The National Conference of Jewish Social Service held in Cincinnati May 9-13 had as its general topic "The Future of Jewish Social Work."

Subjects were quite as technical except that this group indicated an increasing concern with the purely Jewish phases of its purpose. Speakers therefore stressed the need for scientific studies in Jewish demography, the extension of Jewish education and the growth of the Jewish centre. However, Jewish social workers appeared willing to forget all about social and economic conditions that were producing dependency every bit as much as were their non-Jewish confrères. Sidney Hillman, president of the Amalgamated Clothing Workers of America, pointed this out when he declared that trade-unionism was out of sympathy with the aims of social work.

The first *International Social Welfare Fortnight* was held at Paris July 2-13. From 5000 to 6000 delegates assembled from 50 countries. The following four congresses were held: Housing and Town Planning; Public and Private Relief; Child Welfare; Social Work. The housing congress discussed the subjects of the housing of the poor, rural housing, town and rural planning, house-building costs, etc. The congress on public and private relief discussed social insurance and the coördination of the work of preventive and relief agencies. At the child-welfare congress were taken up the following subjects: maternity homes, breast feeding, children's courts, open-air institutions for children, and social work for dependent children. The social work congress, the first ever held, was organized by Dr. René Sand, secretary general of the League of Red Cross Societies. The meetings were held in five sections: general organization of social work, training for social work, methods of social case work, social work and industry, and social work and public health.

The stupendous organization machinery of this last congress may be indicated by the following: forty national reports on the status of the subjects discussed at the five sections above were published in English, French, and German, and reports in the same languages of the papers to be discussed were distributed a month before the conference. Bibliographies were published. Exhibits were organized. Resolutions were passed for the continuance of the organization.

The Association of Community Chests and Councils held their annual meeting February 20 at Washington. Among the speakers were Secretary Hoover, Dr. W. H. Faunce of Brown University, and Louis Marshall, all of whom praised the community chests for collecting large sums of money for charitable purposes. Mr. Hoover, for example, declared that no civilization could endure without spiritual development through public service.

CHARITABLE TRUSTS. It has been observed by social statisticians that philanthropic foundations have a tendency to recede from direct contact with the problems of dependency and to concern themselves with the academic or institutional respects of the subject. That is to say large funds will not be used for the amelioration of dependency but for questionable pieces of re-

search or for institutional building. An example of this tendency is to be found in the re-direction given to the purpose of the Wieboldt Foundation, a Chicago trust fund of \$5,000,000 for the "dispensing of charity." Originally 200 social agencies were the beneficiaries of the fund. However, the 1927 report lists only 43 and of the total expenditure of \$265,000, \$212,000 was turned over to the University of Chicago and the Y. M. C. A. for their building funds. Two pieces of research were conducted under the Foundation's auspices during the year, viz., a study of domestic discord and the moving-picture experiences of 10,000 children.

TRADE UNIONS. A study made by the U. S. Bureau of Labor Statistics revealed that trade-unionism was one of the most powerful agents existent in the United States in the war on dependency. Among the 75 national and international unions examined, it was found that 61 pay death benefits, 13 pay benefits for disability, 13 have benefits in the case of sickness, 13 provide for superannuation, 19 have some form of life insurance, 8 unions take care of their tubercular, 7 maintain homes for the aged. Among the unions, a movement appears to have evidenced itself for the conversion of the death benefit into group insurance, usually of the \$1000 type. Death benefits vary from \$20 to \$1500 payable on the death of the member, \$200 to \$300 being the common maximums. Maximums depend upon the length of affiliation. Disability benefits, too, vary depending upon the length of membership and ranging from \$50 to \$800. In some cases, as in that of the granite cutters, such benefits are paid only when disability is due to an occupational disease. With the granite cutters, payment is made only in the case of blindness. A locomotive fireman or an engine man in good standing gets \$50 monthly if incapacitated. It is interesting to note the brotherhood's definition of a chronic ailment: "Bright's disease, uncompensated valvular disease of the heart, progressive pernicious anemia, permanent paralysis of either extremity, locomotor ataxia, total deafness in both ears, arthritis deformans, diabetes, cancer, or loss of both eyes, a hand, or foot." Sick benefits vary from \$4 to \$10 weekly and the benefit period ranges from 7 to 16 weeks. In some cases, a waiting period of a week is the rule.

The following various types of insurance were being carried by the unions surveyed: 8 carried group life insurance policies, the minimum being \$250 and the maximum \$3000; 6 carried life and total disability; 4 carried life; 5 carried accident insurance policies. During the last fiscal period of the unions studied, a total of ten and a half million dollars was paid out by the unions for the benefits enumerated, viz., death, disability, sickness, old age, etc. It is important to note, too, that during the whole period of operation the trade unions paid out for these benefits a total of \$102,311,174. The insurance payments were equally large. In the latest fiscal period, insured trade unionists to the number of 551,233 collected \$12,009,940 and during the whole period of operation the amount of insurance paid by trade unions has been \$229,780,672.

WELLAND CANAL. See CANALS.

WELLESLEY COLLEGE. A non-sectarian institution for the higher education of women at Wellesley, Mass., founded in 1875. The enrollment for the autumn term of 1928 was 1597, including: 41 resident candidates for the degree

of M.A., 17 for the certificate in hygiene and physical education, and 10 for the degree of M.S. in hygiene and physical education. The actual teaching staff numbered 164 and the officers of instruction and government 248. The trust funds amounted to \$8,995,406, and the income for the year was \$1,117,619 (including dormitories' net). Two new dormitories, Stone and Olive Davis, were opened in January, and ground was broken during the year for a new faculty apartment house. The library contained approximately 125,000 volumes. President, Ellen Fitz Pendleton, M.A., Litt.D., LL.D.

WELSH LANGUAGE AND LITERATURE. See PHILOLOGY, MODERN.

WESLEYAN METHODIST CONNECTION OF AMERICA. See METHODIST, WESLEYAN CONNECTION OF AMERICA.

WESLEYAN REFORM UNION. See METHODISTS, WESLEYAN.

WESLEYAN UNIVERSITY. An institution for the higher education of men at Middletown, Conn., founded in 1831. The 1928 autumn enrollment was 620, the number of students being restricted. The faculty numbered 71. The productive funds of the University amounted to \$4,627,486, and the income for the year was \$541,078. The Olin Library, costing \$750,000, the Shanklin Laboratory of Biology, and the Harriman Dormitory were dedicated during the year. Dr. William A. Heidel, Professor of Greek at the University for twenty-three years, who was appointed research associate of the American Council of Learned Societies in the autumn, was released from his teaching duties and appointed to a specially created fellowship in the Greek language and literature in order that he might be free to carry on his new work. President, James Lukens McConaughy, Ph.D.

WESTENHAVER, DAVID C. American jurist, died at Cleveland, Ohio, July 29. He was born in Berkeley County, West Virginia, Jan. 13, 1865, and was graduated from the law school of Georgetown University in 1886. He began the practice of law at Martinsburg, W. Va., in the same year and a few months later became prosecuting attorney of Berkeley County, serving one year. He removed to Cleveland in 1903 and practiced there until he was appointed by President Wilson judge of the U. S. District Court for the Northern District of Ohio, in 1917. He took an especial interest in patent litigation and was noted for his decisions in patent cases, filed in his court from all parts of the United States. He received the degree of LL.D. from Georgetown University in 1920. In the World War period, Judge Westenhaver drew public attention by his decision releasing thousands of alleged "draft dodgers" because of the statute of limitations, and in September, 1918, he became especially conspicuous as the judge who sentenced the late Eugene V. Debs to a Federal prison for ten years for a seditious speech which the Socialist leader made at Canton, Ohio.

WESTERN AUSTRALIA. A state of the Commonwealth of Australia, comprising that portion of the island continent which lies to the west of the Northern Territory and Southern Australia; the largest state in the Commonwealth, constituting almost one-third of the area of the continent. Area, estimated at 975,920 square miles; population, according to the census of 1921, 332,732; the full-blooded aborigines were estimated at 22,222 in 1925-26; estimated

population of the state on Mar. 31, 1927, 381,470. Capital, Perth, with an estimated population at the end of 1926, including suburbs, of 184,223. In 1926 the movement of population was: Births, 8301; deaths, 3350; marriages, 2844. In 1926 immigrants, 30,732; emigrants, 2912. In 1926, the number of government schools was 824, with 51,716 students enrolled; the number of private schools was 120, with 11,766 students.

The area under crops in 1927 was 3,324,523 acres. The area and production of the principal crops in 1926-27 was as follows: Wheat, 2,571,187 acres, 30,021,616 bushels; oats, 234,826 acres, 2,710,436 bushels; barley, 13,826 acres, 128,136 bushels; hay, 358,487 acres, 423,836 tons; potatoes, 5144 acres, 17,755 tons; orchards, 1294 acres, 291,951 gallons of wine. In 1927-28 the estimated areas sown to wheat, oats, and barley, respectively, were 3,222,369, 411,282, and 18,788 acres. The livestock numbered 166,463 horses, 827,303 cattle, 7,468,766 sheep, 69,798 pigs, 20,979 goats, 5021 camels, and 9442 mules and donkeys. The wool clip was 50,235,640 pounds and the exports, 53,787,555 pounds valued at £3,508,313. Coal and gold are the two leading minerals. In 1926, 474,819 tons of coal valued at £394,400 were raised; the gold production amounted to 437,343 fine ounces valued at £1,857,716.

Trade statistics for 1926-27 showed exports valued at £15,151,959 and imports of £18,374,450. Revenues in the same year totaled £9,750,833 and expenditures, £9,722,588. For the year ending June 30, 1927, the state had 3918 miles of state government railways, and 450 miles of Commonwealth line, the latter being the western portion of the Trans-Australian line, which links the State Railway system to those of the other states of the Commonwealth. For the year ending June 30, 1928, revenues of £3,858,051, operating expenses of £2,910,811, and net earnings after the deduction of charges of £26,871, were reported by the Western Australian Government Railways. These figures represent increases of £250,000 in gross revenues and £225,118 in expenses, but a decrease of £7885 in net earnings over the previous year. The small net earnings were probably due to increased interest charges since the increase shown in gross profit was more than offset by an increase in interest costs. A total of 5,900,883 train miles, an increase of 419,403 over the previous year, were operated. There was also an increase of 256,352 tons in freight carried and of 294,966 in the number of passengers carried. Freight-traffic revenues increased £205,964 over 1926-27 and passenger revenues, £47,894. Freight traffic accounted for more than two-thirds of the gross revenue.

Executive power is vested in a governor who acts through a responsible ministry; and legislative power in a parliament of two houses, a council of 30 members elected for six years and an assembly of 50 members elected for three years. Governor in 1928, Col. Sir William Robert Campion; premier, treasurer, and minister for forests, Philip Collier.

WESTERN RESERVE UNIVERSITY. A non-sectarian institution for the higher education of men and women at Cleveland, Ohio, chartered in 1826. The enrollment for the autumn of 1928 in the regular day curricula was 3869, distributed as follows: Adelbert College, for men, 935; college for women, 811; school of medicine, 245; school of law, 289; school of pharmacy, 114;

school of dentistry, 174; school of nursing, 255; school of library science, 81; graduate school, 438; school of applied social science, 207; school of education, 389; Cleveland College, 161. The enrollment in Cleveland College, the evening school of the University, was 3114, and the enrollment in the courses for teachers in service, was 1838. The summer school in 1928 had a registration of 1983. In the autumn, the faculty numbered 386 professors, associate professors, assistant professors, and instructors, 152 lecturers and demonstrators, and 130 fellows and assistants. The endowment of the University was \$7,819,483, and the income for the year, \$1,739,906. The library contained 300,000 volumes. Within the year, the student health service was established in a separate building and it conducted a medical examination of all students, in addition to having general supervision over the health of the student body. The health-service staff included a medical director, assistants, a nurse, and a dietitian. Notable progress was made in the development of graduate study and research in the appointment of additional men who were to devote all their time to graduate instruction and research. Under a contract entered into by the University and the Board of Education of the City of Cleveland, the former assumed responsibility for the operation of the Cleveland School of Education, with which the University merged its own departments of education and nursery, kindergarten, and primary training. The College for Women received a gift of \$50,000 under the will of Mrs. Seville H. Morse, the income to be used as a loan fund to help students of this college who need financial assistance. President, Robert E. Vinson, D.D., L.H.D., LL.D.

WEST POINT. See UNITED STATES MILITARY ACADEMY.

WEST SPITZBERGEN. The largest and most important of the islands of the Svalbard Archipelago (q.v.), which became of international interest after it passed under the sovereignty of Norway in 1925. Norway promulgated drastic laws for the conservation of game; reindeer cannot be killed until 1935, and all hunting must be done under license and strict regulations. There are immense deposits of coal of high quality, the reserves being estimated at over 10,000 million tons. Mining continues throughout the year, but shipments are usually confined to six months. The shipments were in 1922, 103,000 tons; in 1924, 451,914 tons; in 1925, 414,412 tons.

The population of about 2000 in summer falls in winter to 1500. Ample provisions are made for health and comfort, with church, school, hospital, movies, etc. The largest settlement is Longyear City, at Ice Fiord.

WEST VIRGINIA. POPULATION. According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 1,463,701. The estimated population on July 1, 1928, was 1,724,000. The capital is Charleston.

AGRICULTURE. The table on this page presents the acreage, production, and value of the principal crops in 1927 and 1928.

MINERAL PRODUCTION. The heavy coal production of the mines of the State was sustained in 1927 and exceeded the bituminous production of Pennsylvania for that year in quantity though not in value. There were mined in West Virginia in 1927, 145,122,447 net tons of coal as compared with 143,509,340 in 1926; the value of coal

Crop	Year	Acreage	Prod. bu.	Value
Hay	1928	826,000	1,198,000 ^a	\$17,535,000
	1927	843,000	1,277,000 ^a	19,092,000
	1928	459,000	16,524,000	17,020,000
Corn	1927	441,000	14,774,000	14,774,000
	1928	60,000	7,500,000	6,000,000
	1927	52,000	5,876,000	7,345,000
Potatoes	1928	122,000	1,586,000	2,178,000
	1927	135,000	1,796,000	2,461,000
	1928	204,000	5,712,000	3,599,000
Wheat	1927	217,000	5,251,000	3,361,000
	1928	6,800	5,100,000 ^b	1,178,000
	1927	4,500	3,488,000 ^b	855,000

^a tons, ^b pounds.

mined was \$249,730,000 for 1927 and \$264,736,000 for 1926. Coke production in the State was increasingly from by-product ovens. These furnished, in 1927, 1,401,000 short tons of coke; in 1926, 1,129,862. This product had a value, for 1926, of \$4,265,884. The entire coke output of the State for 1926 was 1,713,461 short tons, in value, \$6,918,103. Blast furnaces of the State produced in 1927, 504,816 long tons of pig iron; in 1926, 364,302. Natural gas, second in importance of the State's mineral products, attained a yield of 180,223,000 M cubic feet in 1926, the latest recorded year; in 1925, of 180,345,000 M cubic feet; in value, \$76,396,000 for 1926 and \$70,903,000 for 1925. Natural gas yielded in 1927, 64,200,000 gallons of gasoline and in 1926, 63,807,000 gallons; in value, \$5,592,000 for 1927 and for 1926, \$7,706,000. Petroleum production was 6,009,000 barrels in 1927 and 5,496,000 barrels in 1926; in value, 1927, \$18,300,000 (estimated); 1926, \$20,560,000. Clay products were valued at \$16,121,172 for 1926 and for 1925, \$15,293,371. Stone, lime, sand, and gravel production were important. The total value of the State's mineral products was \$395,941,940 for 1926; for 1925, \$333,527,697.

FINANCE. State expenditures in the year ended June 30, 1927, as reported by the U. S. Department of Commerce, were: for maintenance and operation of governmental departments, \$12,952,347 (of which \$2,228,610 was for local education); for interest on debt, \$2,510,508; for permanent improvements, \$11,964,378; total, \$27,427,233 (of which \$12,452,106 was for highways, \$2,319,868 being for maintenance and \$10,132,238 for construction). Revenue was \$20,758,241. Of this, property and special taxes formed 23.4 per cent; departmental earnings and charges for the services of State officers, 8 per cent; sales of licenses and taxation of gasoline, 57.7 per cent. Assessed valuation of property was \$2,130,255,951; State taxation thereon, \$2,892,358. Net funded State debt on June 30, 1927, was \$51,536,254. Highway bonds, to the amount of \$49,250,000, formed the chief part of the gross outstanding debt.

TRANSPORTATION. The total number of miles of railroad line under operation on Jan. 1, 1928, was 4006.64. There were built in 1928, 12 miles of first, and 5.48 of second, track.

EDUCATION. An official State-wide survey of education was completed in 1928 and its results were published in four volumes. There was effected, according to State Superintendent Ford's statement in the *Journal* of the National Education Association, an important revision of the course of study in the elementary public schools, and a comprehensive system of teacher training was laid out. The school population of the State in the academic year 1927-28 was placed at 513,065. There were enrolled in the public schools

of the State 401,114 pupils. Of these, 364,457 were in elementary schools and 36,657 in high schools. Expenditures for public-school education in 1927-28 totaled \$25,469,477. The salaries of teachers averaged \$1151.08.

CHARITIES AND CORRECTIONS. A statutory body, the State Board of Control, composed of three members, constituted in 1928 the chief central administrative agency in matters of care and custody of individuals. There were also an independent Bureau of Negro Welfare, a State Board of Children's Guardians, and a State Crippled Children's Council, as well as a Penitentiary Parole Board. There were seven State hospitals, situated at Weston, Spencer, Lakin (colored), Huntington, McKendree, Welch, and Fairmont; two tuberculosis sanatoria, at Hopemont (white) and Denmar (colored); and the following correctional institutions; West Virginia Penitentiary, Moundsville; Industrial School for Boys, Pruntytown; Industrial Home for Girls, at Industrial; State Industrial School for Colored Boys, Lakin; State Industrial Home for Colored Girls, Huntington.

POLITICAL AND OTHER EVENTS. Proceedings against former State Auditor John G. Bond, growing out of Governor Gore's investigation of the Auditor's office in 1926, led to the conviction of Bond March 10, on a charge of embezzlement and larceny. He had previously been impeached by the Legislature, and had thereupon resigned his office. Owing largely to the activity in the non-union coal-mining field of the State, the bituminous coal output of West Virginia continued large in the early months of 1928, in spite of the renewed union-labor difficulties in the spring, and ran little below the Pennsylvania output.

ELECTION. The popular vote of the State for President in the election of November 6 gave Hoover (Republican) 375,551 votes; Smith (Democratic), 263,784. Hoover obtained a higher majority than that of Republican candidates in the last two preceding presidential elections. The vote for Smith (Democratic) was about as great as that for Davis in 1924. For the United States Senate, Dr. Henry B. Hatfield, Republican, won, defeating Senator M. M. Neely, Democrat, running for reelection. A prevailing Republican delegation of United States Representatives was elected. William G. Conley, Republican, was elected Governor, with subordinate officers of his own party.

OFFICERS. Governor, Howard M. Gore; Secretary of State, George W. Sharp; Treasurer, W. S. Johnson; Auditor, Sam T. Mallison; Attorney-General, Howard B. Lee; State Superintendent of Free Schools, George M. Ford; Commissioner of Agriculture, John W. Smith.

JUDICIARY. Supreme Court: President, John H. Hatcher; Associate Judges, W. N. Miller, Frank Lively, Homer B. Woods.

WEST VIRGINIA UNIVERSITY. An institution for the higher education of men and women at Morgantown, W. Va., founded in 1867. In the autumn of 1928, the enrollment was 2650, of whom 1850 were men and 800 women. There were 1057 registered in the summer school of the same year. The faculty numbered more than 300. The libraries contained 92,000 volumes. In 1928 a new women's gymnasium was completed at a cost of \$272,000 and a field house for men at a cost of \$280,000. John Roscoe Turner, Ph.D., was elected president to succeed Frank

B. Trotter, LL.D., on July 1, 1928, and was inaugurated on November 28. In his inaugural address, he announced among his major purposes the establishment of a graduate school, the extension of research, and other far-reaching plans for the development of the University.

WEYMAN, wa'man, STANLEY JOHN. English novelist, died at Ruthin, Wales, April 10. He was born at Ludlow, England, Aug. 7, 1855. He was educated at Shrewsbury and at Christ Church, Oxford, graduating with honors in modern history, and became a barrister in 1881. He gave up the practice of the law to devote himself entirely to writing after his first romance, *The House of the Wolf*, published in 1890, met with public favor. It was followed by a long series of historical novels, which established Weyman as one of the most successful tellers of tales of that genre in his generation. In 1893 appeared his *A Gentleman of France*, singled out for special praise by Andrew Lang; it was translated into several languages. Weyman's lists of books include: *Under the Red Robe* (1894); *My Lady Rotha* (1894); *Memoirs of a Minister of France* (1895); *The Red Cockade* (1895); *The Man in Black* (1896); *Shrewsbury* (1897); *The Castle Inn* (1898); *Sophia* (1900); *The Abbess of Vlaye* (1904); *Starvecrow Farm* (1905); *The Wild Geese* (1908); *The Great House* (1919); *Ovington's Bank* (1922); *The Traveller in the Fur Cloak* (1925) and *Queen's Folly* (1925).

WHARTON, ANNE HOLLINGSWORTH. American author, died at Philadelphia, Pa., July 29. She was born at Southampton Furnace, Pa., Dec. 15, 1845. She was educated at a private school in Philadelphia and early became interested in the Colonial and Revolutionary periods of American history. She wrote many entertaining books and magazine articles and children's stories in this field. She was the first historian of the National Society of Colonial Dames of America, a judge of the American Colonial exhibit at the World's Columbian Exposition, Chicago, 1893, and a life member of the Historical Society of Pennsylvania. She was made an honorary Litt.D. by the University of Pennsylvania in 1924. Her publications include: *St. Bartholomew's Eve* (1866); *The Wharton Family* (1880); *Through Colonial Doorways* (1893); *Colonial Days and Dames* (1894); *A Last Century Maid* (1895); *Life of Martha Washington* (1897); *Heirlooms in Miniatures* (1897); *Salons, Colonial and Republican* (1900); *Social Life in the Early Republic* (1902); *An English Honeymoon* (1908); *In Château Land* (1911); *A Rose of Old Quebec* (1913); *English Ancestral Homes of Noted Americans* (1915); *In Old Pennsylvania Towns* (1920). She was the associate editor of *Furnaces and Forges in the Province of Pennsylvania* (1914).

WHEAT. A summary of the world's wheat supplies and requirements for the year beginning Aug. 1, 1928, by the International Institute of Agriculture, Rome, placed the quantity of wheat available for export at 829,000,000 bushels distributed among the surplus countries as follows: Canada, 450,000,000 bushels; United States, 321,000,000 bushels; Argentina, 33,000,000 bushels; and Australia, 25,000,000 bushels. For Argentina and Australia, the commercial year coincides with the calendar year. Other countries having an export surplus were Bulgaria, Kingdom of the Serbs, Croats; and Slovenes, Hungary, Rumania,

Algeria, and Tunis. India, owing to a light crop, and the United Socialist Soviet Republics, as a result of a poorly distributed production in relation to exportation, were not considered as entering into the export trade during this commercial season. The available surplus from the 1928-29 production in Argentina and Australia was forecast at 275,000,000 bushels, making an available surplus of 1,180,000,000 bushels for the commercial year Aug. 1, 1928, to July 31, 1929. The probable requirements of the importing countries were estimated at 845,000,000 bushels.

The total 1928 production of thirty-five countries reporting was placed at 4,044,139,000 bushels, or 9.1 per cent above the production of 1927 and 17 per cent over the average yield for the five years 1922-1926. The estimates of production for the more important wheat-growing countries outside the United States were as follows: United Socialist Soviet Republics, 859,789,000 bushels; Canada, 500,613,000 bushels; India, 289,781,000 bushels; France, 277,655,000 bushels; Italy, 228,596,000 bushels; Spain, 129,591,000 bushels; and Germany, 126,462,000 bushels. The production of Argentina for the crop year 1927-28 was 239,161,000 bushels and of Australia, 116,184,000 bushels. Early estimates placed the Australian crop of 1928-29 at 154,000,000 bushels.

As estimated by the U. S. Department of Agriculture, the wheat production of the United States in 1928 was 902,749,000 bushels on 57,724,000 acres, the rate per acre being 15.6 bushels. This compared with a production of 878,374,000 bushels, an acreage of 58,784,000 acres, and an average acre yield of 14.9 bushels in the preceding year. On the basis of the average farm price on Dec. 1, 1928, 97.2 cents per bushel, the total value of the crop was \$877,193,000 as against \$1.115 per bushel and a total value of \$979,813,000 in 1927.

Of the total wheat area in 1928, 36,179,000 acres were in winter wheat and 21,545,000 acres in spring wheat. The production of winter wheat was 578,964,000 bushels at the rate of 16 bushels per acre; and of spring wheat, including durum wheat, was 323,785,000 bushels at the rate of 15 bushels per acre. In 1927 the winter wheat production was 552,747,000 bushels and the spring wheat production 325,627,000 bushels.

The distribution of winter wheat production in 1928 showed marked changes as compared with other years. In the East North Central group of States, which produced 108,429,000 bushels in 1927, severe winter-killing as the main factor reduced the yield to 52,585,000 bushels. The West North Central States, producing 210,538,000 bushels in 1927, yielded 274,621,000 bushels in 1928. The South Central States showed a marked increase in yield and the Eastern and Western States a moderate decrease.

Of 39 States reporting winter-wheat production, the yields of the more important producing States were as follows: Kansas, 177,361,000 bushels; Nebraska, 66,697,000 bushels; Oklahoma, 59,576,000 bushels; Washington, 35,600,000 bushels; Texas, 22,176,000 bushels; and Oregon, 20,088,000 bushels. The average yields per acre ranged from 8 bushels in Kentucky to 27 bushels in Arizona. The average yield in Kansas was 17 bushels per acre. The average farm price of winter wheat on Dec. 1, 1928, ranged from 80 cents per bushel in Montana to \$1.56 in Alabama. The average farm price, less than a dol-

lar per bushel in only ten States, was \$1.036 for all the producing States. Of the 25 States reporting spring-wheat production exclusive of durum wheat, the yields in the leading States were as follows: North Dakota, 69,973,000 bushels; Montana, 64,790,000 bushels; South Dakota, 19,312,000 bushels; Idaho, 18,304,000 bushels; and Minnesota, 15,747,000 bushels. The range in the average yield of spring wheat per acre was from 10.3 bushels in South Dakota to 33 bushels in Utah. The average farm price on Dec. 1, 1928, was 91.3 cents per bushel with a range from 82 cents in Wyoming to \$1.65 in Maine.

The production of durum wheat in the four important producing States was estimated at 92,770,000 bushels, as compared with 79,100,000 bushels in 1927, and an average of 61,702,000 bushels for the five preceding years. The average farm price of durum wheat on Dec. 1, 1924, was 71.9 cents per bushel, or 28.7 cents below the price the year before. The yields of the four States reported were as follows: North Dakota, 72,950,000 bushels, or about 79 per cent of the total production; South Dakota, 5,568,000 bushels; and Montana, 278,000 bushels.

During the year ended June 30, 1928, the United States exported 145,999,000 bushels of wheat and 12,921,000 barrels of wheat flour and imported 15,706,000 bushels of grain and 1,123,000 pounds of flour.

The average cost of producing wheat in the United States in 1927, as based by the Department of Agriculture on reports from 3119 farms, was \$21.30 per acre and \$1.18 per bushel. It was produced at lower costs in the Western and North Central States than in the North Atlantic, South Atlantic and South Central States. The average crop production cost per bushel in 1927 was 6 cents more than in the preceding year and from 4 cents to 14 cents less than for the four years 1922-25. The protein content of wheat was being more generally recognized as a factor determining its value and in some States farmers were selling their product on the basis of the percentage of protein it contains.

The increase in the Canadian crop in 1928 was reported as largely offset by dockage and frost damage. As indicated by inspection, about 5 per cent of the crop would be classified as feed, 14 per cent as grading No. 3, and 15 per cent as grading No. 5. The marketing of most of the Canadian crop was being handled by wheat pools or farmers' cooperative organizations which operate over 900 country elevators and terminal elevators with a large total handling capacity.

The use of the combined harvester and thresher, or the "combine," was continuing to increase and types of machines had been developed to meet different needs and requirements. In some instances, grain harvested with the combine needs special attention to avoid spoilage in storage.

The Grain Futures Administration of the United States Department of Agriculture, on July 3, 1928, began the issue of daily reports as to the volume of open commitments at the close of trading in the grain exchanges of the country. The campaign of eradication of the common barberry as a spreader of black stem rust of wheat was continued, and a reduction in losses from rust since the campaign started in 1918 was reported.

WHEAT RUST; WHEAT SMUT. See BOTANY, under *Plant Diseases*; also WHEAT.

WHITEING, whit'ing, RICHARD. English

journalist and novelist, died at London, June 29. He was born at London, July 27, 1840. He received instruction as an engraver, but abandoned that profession for journalism. He began his career as a writer with a series of satirical sketches contributed to the *London Evening Star*; they were afterward published as *Mr. Sprouts—His Opinions* (1867). Subsequently, he served as editorial writer and correspondent for several English dailies, including the *Manchester Guardian* and the *London World*. He was for a while a leader writer for the *London Daily News*. In 1876 appeared his first novel, *The Democracy*, which was followed 12 years later by *The Island*. But he is best known for his *No. 5 John Street* (1899), a vivid description of life in the London slums. Later, he published: *The Life of Paris* (1900); *The Yellow Van* (1903); *Ring in the New* (1906); *All Moonshine* (1907); *Little People* (1908); *A Little Book About London* (1912); *My Harvest* (1914); an autobiography; and (with Dame Genevieve Ward) *Both Sides of the Curtain* (1918).

WHITMAN, whit'măn, WILLIAM. American textile manufacturer, died at Brookline, Mass., September 20. He was born at Round Hill, N. S., May 9, 1842, and worked in a dry goods store at St. John, N. B., when he was twelve years old. He removed to Boston two years later, and was again employed in a dry goods house for eleven years. He was made treasurer of the Arlington Woolen Mills, Lawrence, Mass., in 1867, and was president of the company from 1902 to 1913. Mr. Whitman's interests and influence in the textile industry extended to a number of cities; besides having managed several firms which handled the selling department of the business, he was at one time president of a number of manufacturing companies, including the Calhoun Mills, South Carolina, and the William Whitman Company, Boston. At the time of his death, he was chairman of the board of directors of the latter company, and at the head of four concerns in New Bedford, Mass. He served as president of the National Association of Wool Manufacturers, 1885-94 and 1904-11, being on the executive committee in the interval between his terms. Mr. Whitman led in the initiation of the manufacture of fine worsted and fancy cotton goods in the United States. He was a leading authority on the tariff situation and frequently acted as an adviser in the preparation of tariff legislation. His economic writings received serious attention, especially: *Free Raw Materials as Related to New England Industries*; *Objections to Reciprocity on Constitutional and Practical Grounds*; *The Tariff Revisionist, an Example of the Nature of His Demand* (1906); and *What Are the Protected Industries* (1908).

WIEN, ven, WILHELM. German physicist, and winner of the Nobel Prize in 1911, died at Munich, August 31. He was born at Gaffken, near Fischhausen, East Prussia, Jan. 13, 1864, and after studying at the universities of Göttingen and Heidelberg, he specialized in advanced mathematics and physics at the University of Berlin. He worked as an assistant in the Imperial Physical-Technical Institute, Charlottenburg, 1890-96, also lecturing at the University of Berlin from 1892. When he left Charlottenburg, he was appointed professor in the Technische Hochschule, Aachen, and he subsequently taught at the various institutions, serving as professor of physics in the University of Munich at the

time of his death. Professor Wien visited the United States and lectured at Columbia University in 1913. He received the Nobel Prize for his experiments in radiation, particularly his work in cathode rays, in 1911. Besides editing *Annalen der Physik*, and *Handbuch der Experimental Physik*, he wrote, *Lehrbuch der Hydrodynamik* (1900); and *Neuere Probleme der Theoretischen Physik* (1913).

WILBUR, CRESSY LIVINGSTON. American statistician, died at Utica, N. Y., August 9. He was born at Hillsdale, Mich., Mar. 16, 1865, and after completing advanced courses in philosophy at Hillsdale College in 1886 and 1889, he studied for three years in the Department of Medicine and Surgery at the University of Michigan, and in 1890 he was graduated from Bellevue Hospital Medical College, of New York University. He served as chief of the Division of Vital Statistics of the State of Michigan, 1893-1905, and delivered special lectures on that subject at the Medical Department of the University of Michigan during the last three years of his term of office. Having also become medical referee for the United States Census Bureau, 1901-06, he was appointed chief statistician of vital statistics, July 1, 1906, holding that position until July 31, 1914. On April 7, of that year, he became affiliated with the New York State Department of Health, as director of the Division of Vital Statistics. Dr. Wilbur acted as delegate to several medical conferences, both at Washington, D. C., and at Paris. Besides frequent contributions to scientific periodicals, he edited: the *Michigan Annual Registration Reports* (1891-1903); the *Bertillon Classification of Causes of Death* (1899); the *Manual of International Classification of Causes of Death* (1902-1913); and the United States Census annual reports on mortality statistics (1905-12).

WILCOX, DELOS FRANKLIN. American expert in municipal government, died at New York, April 4. He was born at Ida, Mich., Apr. 22, 1873, and was graduated from the University of Michigan in 1894 and received his Ph.D. from Columbia University in 1896. He was editor of the *Civic News* at Detroit, Mich., 1905-07, after having been engaged in work relating to the improvement of city government, at Cleveland, Ohio, and Grand Rapids and Detroit, Mich. In 1907 he went to New York to become chief of the bureau of franchises of the Public Service Commission, First District. He resigned in 1913, and from 1914 to 1917 was deputy commissioner of the Department of Water Supply, Gas and Electricity, New York City. In 1919-20 he was adviser to the Federal Electric Railways Commission. In his private practice as a public utility expert, he advised a large number of cities on franchise rate and valuation matters. He wrote: *The Study of City Government* (1897); *The American City* (1904); *The Government of Great American Cities* (1908); *Municipal Franchises* (2 vols., 1910-11); *Great Cities in America* (1910); *Government by All the People* (1912); *Analysis of Electric Railway Problems* (1921); *Depreciation in Public Utilities* (1925). He also wrote *Ethical Marriage* (1900).

WILDER, HARRIS HAWTHORNE. American zoölogist and educator, died February 27. Born at Bangor, Me., Apr. 7, 1864, he was graduated from Amherst in 1886, and received the Ph.D.

degree from the University of Freiburg, Baden, in 1891. Having taught at the Jefferson High School, Chicago, 1886-89, and at the Lake View High School, 1891-92, he was appointed professor of zoölogy at Smith College in the latter year, where he remained until his death. As part of his extensive study of prehistoric man, Dr. Wilder specialized in the embryology, anatomy, and teratology of vertebrates and in the epidermic markings of the soles and palms of primates. Besides his many zoölogical papers, Dr. Wilder wrote the following books: *Invertebrate Zoölogy* (1894); *Synopsis of Animal Classification* (1902); *The History of the Human Body* (1910, 2d ed. 1923); *Personal Identification* (with B. Wentworth, 1918); *Manual of Anthropometry* (1920); *Man's Prehistoric Past* (1923); and *The Pedigree of the Human Race* (1925).

WILLIAM AND MARY, COLLEGE OF. An institution for the higher education of men and women at Williamsburg, Va., founded in 1693. The enrollment for the autumn semester of 1928 was 1356, of whom 605 were women and 745 were men. There was also an enrollment of 1818 students in extension classes in Norfolk, Richmond, and Newport News. The summer session had 850 students. There were 70 members on the faculty. The college had productive funds to the amount of \$332,557, and the income for the year was \$729,365. The library contained 60,000 volumes. President, Julian A. C. Chandler, Ph.D.

WILLIAMS, FREDERICK WELLS. American educator and sinologist, died at New Haven, Conn., January 22. He was born Oct. 31, 1857, at Macao, the Portuguese colony in China, where his father, Samuel Wells Williams (1812-84) was stationed as a missionary; the elder Williams was the author of *The Middle Kingdom*, one of the first authoritative books in English on China. The younger Williams was graduated from Yale, 1879, and studied for two years at the universities of Göttingen, Berlin, and Paris. From 1883 to 1885 he was assistant librarian of the Yale library, and then for six years literary editor of the *National Baptist*. He returned to Yale as instructor in Oriental history, 1893-1900, and from 1900 to 1925, when he retired as emeritus, he was assistant professor of modern Oriental history. He was chairman of the board of trustees of Yale-in-China. He assisted his father in the preparation of *The Middle Kingdom* (1883), and wrote a biography of his father (1889), besides the following: *Chinese Folklore* (Smithsonian Institution report for 1900); *Problems of Chinese Immigration in Farther Asia* (1900); "China and Japan" (bk. iv., vol. ii., *History of All Nations*) (1903); *A History of the Class of 1879, Yale College* (1906); *Relations Between the United States and China* (1910); *Anson Burlingame and the First Chinese Mission to Foreign Powers* (1912); *The Best Hundred Books on China* (1924). He also edited books on Siam and Japan and wrote many articles on Chinese and other Asiatic subjects.

WILLIAMS, HENRY G. American educator, died at Wilmington, Ohio, June 15, at the age of sixty-three. He was superintendent of schools at Lynchburg, Ohio, and later filled similar positions at Belleaire and Marietta, Ohio. In 1901 he became dean of the normal college of the

University of Ohio, at Athens, and filled that position until 1915, when he was appointed Commissioner of Public Instruction for Ohio. In 1927 he became president of Wilmington College, Wilmington, Ohio, and held the office at his death.

WILLIAMS, TALCOTT. American journalist and educator, died at New York, January 24. He was born July 20, 1849, at Abeih, Turkey, where his father and mother were Congregationalist missionaries. He was graduated from Amherst College in 1873. Entering newspaper work, he was on the staff of the *New York World* in 1873-77, and served as Washington correspondent of the *New York Sun* and the *San Francisco Chronicle* in 1877-79, and as editorial writer for the Springfield, Mass., *Republican* in 1879-81. Thereafter he was an editor of the *Philadelphia Press*, until in 1912 he became director of the new School of Journalism at Columbia University, built and endowed by Joseph Pulitzer. With Frank Moore Colby, he was editor of the second edition of the *NEW INTERNATIONAL ENCYCLOPEDIA*.

Dr. Williams was quite well known as a public speaker. He was elected vice president of the Pennsylvania Society for the Prevention of Tuberculosis and an honorary member of the Pennsylvania State Bar Association. In 1913 he served as president of the American Conference of Teachers of Journalism. He resigned as director of the School of Journalism in 1919, and received the title of director emeritus from the trustees of Columbia University. He was a member of the American Philosophical Society, the American Oriental Society, and the American Academy of Political and Social Sciences, and held officerships and memberships in numerous other societies. From 1912 to 1915 he was president of the Honest Ballot Association, thereafter becoming a director. While lecturing on journalism and other subjects, he found time to write literary, art, and dramatic criticisms. Dr. Williams received honorary degrees from Amherst, the University of Pennsylvania, Western Reserve University, Brown University, Hobart College, Pennsylvania College, Franklin and Marshall College, the University of Rochester, and the University of Pittsburgh. He wrote: *Turkey, a Problem of To-day* (1921); *The Newspaper Man* (1922).

WILLIAMS COLLEGE. A non-sectarian college for men at Williamstown, Mass., founded in 1793. The enrollment for the autumn of 1928 totaled 807, including 9 graduate students, 170 seniors, 183 juniors, 212 sophomores, and 233 freshmen. There were 82 members on the faculty, of whom 14 were new appointments. The productive funds of the College amounted to \$5,591,579, and the income for the year ending June 30, 1928, was \$723,803. The library contained 124,733 volumes, Lehman Hall, a freshman dormitory, presented by Colonel Herbert H. Lehman of the Class of 1899, New York City, was completed during the year. President, Harry Augustus Garfield, LL.D. See POLITICS, INSTITUTE OF.

WILLIS, FRANK BARTLETTE. American educator and United States Senator from Ohio, died suddenly at Delaware, Ohio, March 30, while waiting to deliver an address in his campaign for the Republican nomination for the Presidency, as the "favorite son" of Ohio. He was born at Lewis Center, Ohio, Dec. 28, 1871.

He was graduated from Ohio Northern University in 1893, and from 1894 to 1906 held the chair of history and economics at the university. He early took an active interest in politics and made a speaking tour of Ohio for the Republican presidential nominee in 1896. In 1900 he was elected to the Ohio House of Representatives and served four years. In 1906 he gave up his professorship of history and economics, having studied law and having been admitted to the Ohio bar, and for a short time he was professor of law at the university. In 1910 and in 1912 he was elected to the National House of Representatives, and two years later was chosen Governor of Ohio in succession to James M. Cox. In 1916, however, the two ran against each other again for the governorship, and this time Cox was successful. Willis was an unsuccessful candidate for governor in 1918, but in 1920 was elected United States Senator in place of Warren G. Harding, who had been elected President. Mr. Willis had begun his second term in the Senate at the time of his death, having been reelected in 1926. He was one of the leaders of the Republicans in the Senate and was especially noted as an orator. In 1916 he placed Theodore E. Burton in nomination at the Republican National Convention, and in 1920 he performed the same office for the successful candidate, Senator Harding.

WILLS, SIR GEORGE ALFRED, BARONET. British industrialist and philanthropist, died at Burwalls, Leigh Woods, near Bristol, England, July 11. He was born June 3, 1854, and was educated privately at Clifton, and then attended Mill High School in Middlesex. In 1874 he entered the extensive family tobacco business, W. D. & H. O. Wills, at Bristol, and became in time the managing director. When the business was taken over in 1901 by the Imperial Tobacco Company of Great Britain, he was made deputy chairman and he succeeded his cousin, the late Lord Winterstoke, as chairman in 1911. He retired in 1924. He had been created a baronet in 1923. Sir George was a director of the Great Western Railway and was sheriff of Bristol, 1899-1900. He held the honorary degree of D.C.L. from Oxford and that of LL.D. from the University of Bristol. He was the possessor of one of the largest fortunes in Great Britain and was noted for his munificence, especially to the philanthropies and public institutions of Bristol. He and his brother presented the main building to Bristol University, at a cost of more than £500,000.

WILSON, LUTHER BARTON. American clergyman, retired bishop of the Methodist Episcopal Church, died at Roland Park, Md., June 4. He was born at Baltimore, Md., Nov. 14, 1856, and was graduated from Dickinson College in 1875, and from the medical department of the University of Maryland in 1877. After entering the ministry of the Methodist Episcopal Church in 1878, he served in several pastorates, and was a presiding elder in the Baltimore Conference when he was elected bishop in 1904. He was assigned to the Chattanooga, Tenn., district, and four years later was transferred to the metropolitan district of New York, and he remained there to the end of his active career. He was one of the organizers of the Anti-Saloon League, in 1895, and was its first vice president, succeeding to the presidency in 1901 and holding the office many years. For more than a

quarter of a century, Bishop Wilson was one of the leaders of his denomination, holding several high offices; being a prominent figure in public life, he was much in demand as an orator. In 1917 he went to France with the A. E. F. as a leader in Y. M. C. A. work, and was active throughout the War period. He was a director of the Church Peace Union and a trustee of Dickinson College and of the Drew Theological Seminary. He received the degree of D.D. from Dickinson in 1892 and that of LL.D. in 1904. Wesleyan University also conferred the degree of LL.D. on him in 1913, and Syracuse University that of L.H.D. in 1912.

WILSON AWARD. See WOODROW WILSON AWARD.

WINDWARD ISLANDS. The name applied to a group of islands in the West Indies, comprising Grenada, St. Vincent, and St. Lucia, together with the Grenadines (which are one-half under Grenada and one-half under St. Vincent); forming the eastern limit of the Caribbean Sea between Martinique and Trinidad; a British possession. (See articles on the islands mentioned above.) Each of the islands is under its own government, but they are united for certain common purposes and have a court of appeals. Governor and commander-in-chief in 1928, Sir Frederick Seton James.

WINGATE, GEORGE WOOD. American lawyer, advocate, and organizer of rifle practice, died at New York, March 22. He was born at New York, July 1, 1840, and was educated at the public schools. During the Civil War, he went to the front with a New York regiment, and also saw service in New York City during the Draft Riots. He was in law practice in New York many years and was assistant general counsel for the Long Island Railroad. For many years he was one of the outstanding American advocates of rifle practice. In 1867 he drew up rules for systematic practice by Company A, Twenty-second Regiment, New York National Guard, of which he was then captain. The publication of these rules (the first of the kind to be formulated in the United States) led to the organization in 1871 of the National Rifle Association of America, of which he was first secretary and later president for 25 years. He was also founder, in 1904, of the Public Schools Athletic League, and was a member of the general committee of the Boy Scouts. He wrote: *Manual for Rifle Practice* (1872, with several subsequent editions); *The Great Cholera Riots* (1880); *Through the Yellowstone Park on Horseback* (1886); *History of the Twenty-second Regiment, National Guard of New York* (1896), and many articles on military subjects.

WINSLOW, E(hen) EVELETH. American army officer and engineer, died at Raleigh, N. C., June 28. He was born in the District of Columbia, May 13, 1866, and was graduated from the United States Military Academy at the head of his class in 1889. He studied at the Engineering School of Application, graduating in 1892. His services were almost entirely confined to the engineering works of the United States Army, but he commanded a company at the Battle of San Juan, Cuba, in 1898. He was connected with river and harbor and fortification work at various times at Mobile, Ala., Wilmington, N. C., Norfolk, Va., and Honolulu. T. H. Winslow was designing engineer on the fortification of the Canal Zone and a member

of the advisory board on the fortification of Chesapeake Bay and of Guantanamo Bay, Cuba. In 1914 he was made assistant to the Chief of Engineers of the Army. During the World War, he organized the engineering troops of the Army, and received the Distinguished Service Medal in recognition of his efforts. He attained the rank of brigadier general in the National Army in 1917, and was honorably discharged as such in 1919. In the regular establishment, he held the rank of colonel when he was retired, Nov. 1, 1922.

WIRELESS TELEGRAPHY. See RADIO TELEPHONY AND BROADCASTING.

WISCONSIN. POPULATION. According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 2,632,607. The estimated population on July 1, 1928, was 2,953,000. The capital is Madison.

AGRICULTURE. The following table presents the acreage, production, and value of the principal crops in 1927 and 1928:

Crop	Year	Acreage	Prod. bu.	Value
Hay	1928	3,477,000	5,296,000 ^a	\$74,756,000
	1927	3,649,000	7,283,000 ^a	89,849,000
Corn	1928	2,121,000	91,203,000	71,138,000
	1927	2,100,000	68,253,000	57,330,000
Oats	1928	2,495,000	108,532,000	46,669,000
	1927	2,422,000	98,247,000	43,826,000
Potatoes	1928	278,000	31,970,000	12,738,000
	1927	260,000	23,920,000	20,332,000
Barley	1928	725,000	26,898,000	17,484,000
	1927	620,000	21,390,000	16,042,000
Rye	1928	167,000	2,171,000	1,954,000
	1927	238,000	4,046,000	3,641,000
Tobacco	1928	37,000	49,025,000 ^b	8,824,000
	1927	31,000	33,170,000 ^b	5,315,000
Wheat	1928	104,000	2,141,000	2,262,000
	1927	145,000	3,142,000	3,676,000

^a tons, ^b pounds.

MINERAL PRODUCTION. After the production of pig iron, which attained a quantity of 235,597 long tons and a value of \$5,034,012 for 1926, the output of stone was the most important element of mineral production in 1926. It attained 2,852,070 short tons, as against 2,541,370 for 1925; in value, \$4,937,661 for 1926, and \$4,208,201 for 1925. The quantity of zinc mined in 1927 was 32,841 short tons; in 1926, 26,800. The value of zinc produced was \$4,203,648 for 1927 and \$4,020,000 for 1926. Of lead there were mined 2069 short tons in 1927 and 1546 in 1926; in value, \$260,694 in 1927 and \$247,360 in 1926. Iron mines in the State shipped 937,935 long tons of iron ore in 1927 and 1,238,885 in 1926, for which year this product was valued at \$3,178,156. Lime production was 196,000 short tons (estimated) for 1927, as against 216,214 for 1926; in value, \$1,680,000 (estimated) for 1927 and for 1926, \$1,896,772. The total value of the State's mineral products was \$21,711,736 for 1926; for 1925, \$19,205,380.

FINANCE. State expenditures in the year ended June 30, 1927, as reported by the United States Department of Commerce, were: for maintenance and operation of governmental departments, \$31,070,324 (of which \$5,562,672 was aid to local education); for interest on debt, \$123,459; for permanent improvements, \$13,656,704; total, \$44,850,487 (of which \$15,810,474 was for highways, \$4,444,044 being for maintenance and \$11,366,430 for construction). Revenue was \$46,428,373. Of this, property and special taxes formed 38.8 per cent; departmental earnings and

charges for officials' services, 9.6 per cent; sales of licenses and taxation of gasoline, 39.5 per cent. State taxes levied amounted to \$7,451,220. Only street railways were taxed for State purposes. Net funded State debt on June 30, 1927, was \$1,663,700.

TRANSPORTATION. The total number of miles of railroad line under operation on Jan. 1, 1928, was 7355.99. There were built in 1928, 2.84 miles of additional first, and 26 of second, track.

EDUCATION. A new common-school equalization law was put into effect in the State in 1928, along with special provisions for the education of crippled children. The equalization law was characterized by an informant in the *Journal* of the National Education Association as making for a more equitable distribution of State aid to the local school systems, aid having been previously rendered on a somewhat different system. The school population of the State was given as 868,239 in the school year 1927-28; the total public-school enrollment as 518,035. There were enrolled in the elementary schools 412,065 pupils, and in the high schools 105,970. The total expenditure of the year for public-school education was \$54,432,522.41. The salaries of teachers averaged \$1459.

CHARITIES AND CORRECTIONS. The State Board of Control, created by statute of 1917, has for its chief function to maintain and govern the charitable, curative, penal, and reformatory institutions of the State. It consists of three members, who are appointed by the governor, one every two years for terms of six years, and one of whom under the statute must be a woman. It has power to authorize operations for the sterilization of inmates of criminal, insane, feeble-minded, and epileptic institutions in cases in which experts pronounce procreation inadvisable; also to administer Wassermann tests. It investigates and supervises county and municipal institutions. Under a law of 1923 it has authority to initiate a plan of employment on public works in time of industrial depression. It exercises control over prisoners released on probation; guardianship over dependent children in the State Public School; and powers as a commission in lunacy. The State institutions, with their inmate populations of October 31, 1928, were: State Hospital for Insane, Mendota, 724; Memorial Hospital, Mendota, 284; Northern Hospital for Insane, Winnebago, 639; Central State Hospital for Insane, Waupun, 197; School for Deaf, Delavan, 186; School for Blind, Janesville, 120; Workshop for Blind, 48; State Public School, Sparta, 438; Industrial school for Boys, Waukesha, 356; Industrial School for Girls, Milwaukee, 193; Industrial Home for Women, 83; State Reformatory, Green Bay, 542; State Prison, Waupun, 1013; Northern Colony and Training School (feeble-minded), Chippewa Falls, 1262; Southern Colony and Training School (feeble-minded), Union Grove, 384; State Sanatorium (tubercular), Statesan, 156; Tomahawk Lake Camp (tubercular convalescents), 39. The total institutional population was 6661.

LEGISLATION. The State Legislature held a special session in January, at the call of Governor Zimmerman, to provide revenue in order to meet an apprehended deficit in the State finances, due to the failure of revenue legislation in the regular 1927 session. A legislative inquiry into the practice, among members of the State

Railroad Commission, of taking part-time employment with public utility companies was held and the commission subsequently, in April, at the request of Governor Zimmerman, passed a resolution against the practice. An appropriation for the State University, which was passed, carried provision that the regents might borrow from the teachers' retirement fund, through a corporation created for the purpose, in order to build.

POLITICAL AND OTHER EVENTS. The State Supreme Court upheld, July 20, the constitutionality of the State insurance-rating law, under which the Insurance Commissioner had power to accept or overrule the inspection bureau of the insurance companies with regard to ratings on property and rules under which insurance might remain in effect. The decision was characterized by the State Attorney-General's office as departing from precedent in recognizing a delegation of legislative power to a State officer. The provision of the State constitution prohibiting the contracting of State debt was avoided by the State University, for the purpose of constructing the proposed Memorial Union Building. A corporation was formed to lease land from the Regents, borrow funds from the teachers' retirement fund, build the structure desired with these funds and lease the structure to the State. The State Supreme Court was consulted by officers of the teachers' retirement fund, and rendered an opinion favorable to the proceeding. The increasing interest in forest conservation in Wisconsin was marked by a commercial forestry conference held in Milwaukee at the end of March. The State Land Commission approved in May for Federal forest areas, subject to Federal acquisition, lands in five northern counties, to a combined total of 500,000 acres.

In Milwaukee at a local election held on April 14, the Socialist Mayor Hoan was retained in office for another term, but the number of Socialist aldermen was reduced to six out of a total of 19. The suburb of North Milwaukee voted for annexation to the city. Progress of a municipal harbor development was delayed by difficulty encountered in bringing about the construction by the Northwestern Railroad of a rail connection between car ferry slips and proposed classification yards. An arrangement was reached in July according to which this railroad, the Pere Marquette, and the harbor commissioners were to cooperate on the yard and car ferry slips, the latter to cost the city \$400,000; the Pere Marquette was to provide a car ferry between Milwaukee and Muskegon at an anticipated cost of \$800,000. The intention was to provide the city with an eventual port for ocean vessels, for the time when the projected waterway from the Lakes to the Atlantic should be complete. See **WORKMEN'S COMPENSATION.**

ELECTION. In the highest popular vote till then recorded in the State, Hoover, Republican presidential candidate, gained at the election of November 6 the electoral support of the State. He received 544,205 popular votes; Smith, the Democratic candidate, received 450,259. The Smith vote, though a minority, was greatly in excess of those cast for Cox in 1920 and Davis in 1924. The centre of Smith's strength was in Milwaukee, where sentiment against Prohibition was widespread. Robert M. LaFollette, Jr., although the efforts of his group to make the State platform at the Republican State Conven-

tion in September had been defeated, ran for reelection as the Republican nominee to the United States Senate and defeated William H. Markham (Democrat). A completely Republican delegation was elected to the House of Representatives. Victor L. Berger, the Socialist Representative from Milwaukee, had apparently failed of reelection, but a recount was ordered. For Governor, Walter J. Kohler, Republican, defeated Albert G. Schmedeman, Democrat, and the other Chief Republican candidates on the State ticket were likewise elected.

OFFICERS. Governor, Fred R. Zimmerman; Lieutenant-Governor, Henry A. Huber; Secretary of State, Theodore Dammann; State Treasurer, Solomon Levitan; Attorney-General, John W. Reynolds; State Superintendent of Schools, John Callahan.

JUDICIARY. Supreme Court: Chief Justice, Aad J. Vinje; Associate Justices, Marvin B. Rosenberry, Franz C. Eschweiler, Walter C. Owen, Christian Doerfler, Charles Crownhart, E. Ray Stevens.

WISCONSIN, UNIVERSITY OF. A State institution of higher education at Madison, Wis., founded in 1848. The enrollment for the autumn of 1928 was 9042, distributed as follows: Letters and Science, 6446; engineering, 962; agriculture (including home economics), 705; law, 341; medicine, 291; nursing, 99; music, 157; library, 41. For the summer session the enrollment totaled 5065, with the following distribution: Letters and science, medicine, music, and nursing, 4393; engineering, 200; agriculture and home economics, 292; law, 126; library, 54. The faculty numbered 1284 in the autumn of 1928, including 297 new members. The productive funds of the University amounted to \$1,025,313, and the income for 1927-28 to \$7,951,001. The library contained 796,000 volumes and 387,000 pamphlets. President, Glenn Frank, M.A., Litt.D., L.H.D., LL.D.

WISE, THOMAS ALFRED. American actor, died at New York, March 21. He was born at Faversham, England, Mar. 23, 1865, and was brought to America when three. He began his work as an actor in California in 1883 and was a favorite with American audiences for many years, until failing health affected his playing, about a year before his death. His greatest success was gained in the rôle of Senator William H. Langdon, in *The Gentleman From Mississippi*, 1908-11, which play he wrote with Harrison Rhodes. He appeared also in *Mr. Wilkinson's Widows*, *The Prince Chap*, *Are You a Mason?* *Mrs. Temple's Telegram*, and many other plays that were successful. Mr. Wise was very popular among his fellow players, and they honored him by election to high offices in their organizations. He was vice president of the Lambs, 1910-11, and was the Shepherd of that organization when he died. He was also a member of the governing boards of the Players, the Green Room Club, the Dramatists' Association and the Green Room Club of London.

WOELFKIN, CORNELIUS. American clergyman and a leader in the Baptist denomination in the United States, died at New York, January 6. He was born at New York, Sept. 16, 1859. He was educated at the public schools of New York, and educated himself in theology and other subjects while working as a painter. In 1886, after he had already preached for a year as a layman, at a church at Bagnall, N. Y.,

he was ordained in the Baptist ministry. In early years, he was a revivalist, going from church to church to preach. His first formal pastorate was that of the First Baptist Church of Hackensack, N. J., 1887-92; then he served as pastor of the North Church, Jersey City, N. J., 1892-94; pastor of Greene Avenue Church, Brooklyn, N. Y., 1894-1905; with the American Baptist Home Missionary Society, 1905-06. In the latter year his high reputation as a theologian and preacher, notwithstanding the fact that he was self-taught, brought him the chair of homiletics at the Rochester, N. Y., Theological Seminary. He remained there until 1912, when he was called to the pulpit of the Fifth Avenue Baptist Church, of New York, now the Park Avenue Baptist Church. He remained in the pastorate actively until 1926, when he became pastor emeritus. As pastor of the church attended by John D. Rockefeller, Sr. and John D. Rockefeller, Jr., he was associated with them in their philanthropies. He was a leader of the "modernists" in his church. He received the degree of D.D. from Rutgers, Rochester, Colgate, and New York universities, that of Litt.D. from Franklin and Marshall University and that of LL.D. from Denison University. He was a trustee of Rochester Theological Seminary, a member of the council of New York University, and a director of the Union Theological Seminary. In 1911 he was president of the American Baptist Foreign Missionary Society. In 1899 Dr. Woelfkin published *Chambers of the Soul*.

WOMAN'S CHRISTIAN TEMPERANCE UNION. An all-partisan and all-sectarian movement which has as its purpose the protection of the home by the abolition of the liquor traffic. The Union comprises 10,000 local unions with a membership of approximately 600,000 and is organized in every State, territory, and dependency of the United States, including the District of Columbia, Alaska, Hawaii, Porto Rico, and the Philippines. The Young People's Branch for both young men and women who are united for temperance and prohibition and the Loyal Temperance Legion for children are under its supervision. The official organ of the Union is *The Union Signal*; *The Young Crusader* is published for boys and girls. The officers for 1928 were: President, Mrs. Ella A. Boole; vice president-at-large, Mrs. Ida B. Wise Smith; corresponding secretary, Mrs. Anna Marden DeYo; recording secretary, Mrs. Sara H. Hoge; assistant recording secretary, Mrs. Nelle G. Burger; and treasurer, Mrs. Margaret C. Munns. The main headquarters are at Evanston, Ill.; the legislative headquarters are at the Hotel Driscoll, Washington, D. C. See PROHIBITION.

WOMEN IN INDUSTRY. The YEAR BOOK has printed the progress of legislation in the United States in the interests of women engaged in industry. There have been recounted here the efforts to restrict the hours of labor of women, to obtain for them the benefits of a minimum wage, to prohibit night work, etc. How salutary has this type of legislation been? More specifically, has protective legislation interfered with the ability of women to obtain employment particularly in competition with men? The United States Women's Bureau, in 1928, applied itself to the answering of this important question and, as a result of a study made in a group of industries in a number of States, found that protective legislation for

women was regarded with favor rather than otherwise. In other words, women were being helped in their employment by special legislation.

The following five industries were studied: boots and shoes, hosiery, paper boxes, electrical products, and clothing. A total of 1661 establishments in 179 towns in 11 States employing 665,000 workers was examined. This was the conclusion that the Bureau reached with regard to the effect of a shorter day for women on their possibilities for employment:

The general attitude of the present-day manager in industry . . . shows that the adoption of the shorter-day standard is an almost universal development. . . . The enforced or voluntary shortening of hours for women seems to have brought with it in most instances a similar decrease for men. But whether or not they have been shared by men, there is absolutely no indication in any of the establishments studied that the shorter hour schedules have been in any way a handicap for women.

The best test of the problem was in Massachusetts where the law prescribes a 9-hour day and a 48-hour week. Here, 82 establishments reported that they would have liked a longer working day for women but a complete count showed that women were debarr'd from only 500 jobs—less than one-half of 1 per cent—because of the shorter working day. The Bureau found the same state of affairs with regard to the effect of night work on jobs for women. The following States do not prohibit night work: New Hampshire, Rhode Island, Ohio, Illinois. On the other hand, Wisconsin, New York, Massachusetts, and Indiana do. But the prohibition had nothing to do with the obtaining of jobs. The Bureau found a general prejudice among managers toward the employment of women at night, law or no law. Ohio, for example, has no such law. Yet out of a total of 409,970 working women in that State, only 2695 women were found to be night workers. What was true of factories was equally the case in stores. A total of 54 stores in Massachusetts and California (where there were hour laws) and in Indiana (where there was none) was studied. Nowhere had the hour law on the statute books led to the hiring of men instead of women. The same was true in restaurants. The surveyors studied 198 restaurants where 2537 men and 2361 women were employed in the following States: California (which has an hour law but allows night work), New York (which has an hour law and does not allow night work) and Illinois (which had practically no prohibitions on either score). In really few cases were men employed instead of women because of restrictive legislation. Where men were given preference, the reasons lay outside the law, i.e., that high-class service in restaurants demanded men, that men should be given first chance at the jobs where the tips were higher, etc.

The Bureau found, in the cases of these industries where women were dropped out, that the reasons were not because of restrictive legislation but because the women were fundamentally unsuited for the jobs. This was true of women car conductors, taxi drivers, metal workers, etc. There is no question, of course, that, in certain particular types of employment, losses of jobs were due to the passage of restrictive legislation, e.g., when women were discharged from their positions as subway ticket sellers because they could not work at night. The con-

clusion is plain here: that one should not expect blanket legislation to be successful in every particular. Nevertheless, this study has demonstrated beyond doubt that restrictive legislation limiting hours of work and prohibiting night work has not prevented women from getting jobs.

PROTECTIVE LEGISLATION. The Women's Bureau, in a survey published during the year, pointed out the total lack of general standards prevailing among the States with regard to the conditions affecting the employment of women. With regard to hours of employment, while 43 States had laws limiting the number of hours, only 10 specified an 8-hour day while the range runs up to 11 hours and in one case to 12 hours. The report pointed out that in many States, because the industries in which restrictions are set are enumerated, very few of the total number of women working are affected. It is significant to set down, however, that in a few States, notably New York, Massachusetts, and Pennsylvania, the codes are very liberal and apply to practically all women engaged in industry. The existence of industrial commissions helps in the extension of laws for the protection of women.

It is significant to note that the United States Supreme Court's finding that the District of Columbia minimum-wage law was unconstitutional had not affected the status of similar legislation in the States of South Dakota, Utah, California, Colorado, Massachusetts, North Dakota, Oregon, Washington, and Wisconsin. The first two had minimum-wage laws in enumerated industries; in the others, there were commissions which have the right to study particular industries for the purpose of setting minimum rates. The fact is, these commissions have functioned in all the States but Colorado. In all the other States but Massachusetts, the findings of the commission are mandatory, while in Massachusetts, as has been pointed out in previous *YEAR BOOKS*, a powerful public opinion evoked through the posting of the names of recalcitrant employers in the newspapers in effect brings about the same result. Nevertheless, the highest rate ever set had been that of the California commission which had fixed a weekly wage of \$16 for all industries. In Utah, the rate fixed had been only \$7.50. By implication, the Bureau's report finds wage fixing by law unsatisfactory for it says: "Where the rates are set by law, they have not responded to the great rise in the cost of living since 1914."

WOMEN'S PARTY IN THE ELECTION CAMPAIGN. One of the real anachronisms of modern times was the work of the National Women's party, which was so jealous for the equal place of women before the law that it was actively waging war on the presence, in State codes, of all laws giving women special protection in industry. Early in the presidential campaign, it elicited a statement from Secretary Hoover that he was in favor, in principle, of the National Amendment the National Women's party was sponsoring. On September 12, therefore, the party endorsed the candidacy of Mr. Hoover. In October, however, Mr. Hoover told the Women's Trade Union League that any change in the existing laws regulating the conduct of women in industry was deplorable. The result was the defection of a number of leaders of the Women's party who announced that they were supporting Governor Smith. It must be

declared, however, that Governor Smith gave these ladies small comfort, for in his speech of October 31, delivered at Newark, he said: "When it comes to woman's legal status, when it comes to the custody of children, when it comes to property rights, I will go as far as anybody in the world to maintain the equality between men and women. But what I will never do is consent to the passage of an amendment to the Federal Constitution that will prohibit the States from enacting legislation to promote the health, the comfort, and the happiness of women who are compelled to work in factories." The National Women's party, ambiguity on the part of its favorite candidate or not and defections notwithstanding, decided to make the best of a bad bargain and on October 31, it reiterated its support of Secretary Hoover.

HOME WORK. The Department of Labor, in a study made of a group of 623 families residing in certain industrial sections of the State of New Jersey, reported that 85 per cent of all the mothers in these families were working at home. Almost all the families were foreign-born. Two-thirds of the families declared that the work had originally been undertaken to supplement the family income, rendered inadequate because of the unemployment of the chief breadwinner. A large number of the mothers thus engaged were working from five to eight hours daily in addition to performing their home tasks and taking care of their children. Of the 334 families that kept track of yearly earnings as a result of the work of the mother (and, it should be said, of many of the children as well), fully half reported that the total family earning in this extra industrial activity had not been \$100 for 12 months. This industrial home work was largely on men's and women's clothing coming from New York and Philadelphia manufacturers. Other types of employment included work on powder puffs, packing Christmas cards, stringing tags, carding buttons and safety pins.

RUSSIA. Dr. George M. Price, in his *Labor Protection in Soviet Russia* (1928), points out that all industrial workers have the following privileges with respect to hours and rest periods: an 8-hour working day; a reduced labor day in especially hazardous industries; reduced hours for night workers; limitation of overtime; a rest period of 42 consecutive hours every week; annual vacations with full pay are allowed, industrial workers getting two weeks and office workers and those employed in hazardous trades, four weeks. Women in industry in addition to the above benefits are entitled to these special considerations: they may not work in the following hazardous trades: mining, work with rubber, benzol, trinitrotoluol, in foundries, gas scrubbers, in lead, copper, mercury, zinc, silver, and other mines, in foundries, gas scrubbers, in lead, copper, mercury, zinc, silver, and other mines, in smithies, lumber work, etc.; they may not work from 10 P.M. to 6 A.M.; they may not work at occupations where they must lift more than 10 pounds. Women under 18 and pregnant and nursing mothers come in for additional benefits.

RUMANIA. In April, a complete labor code was enacted in this country for the protection of women and children in industry. The working day was fixed at 8 hours and the working week at 48 hours in the following industries: mines and quarries, manufacturing, transport.

A commission was appointed to draw up the details of the code with particular reference to the draft conventions of the League of Nations that the country had ratified. The ministry of labor was to take under consideration the reduction of hours in hazardous industries.

JUGO-SLAVIA. A recent labor code in this country provided for the elimination of night work for women and for children under 18; the employment of pregnant women two months before their confinement and for two months following was prohibited; and women with nursing children were to be allowed time off for nursing in nurseries provided by the management.

WOMEN IN SPORT. See **ATHLETICS**.

WOMEN'S CLUBS. **GENERAL FEDERATION OF.** An organization founded in 1889 and chartered by Act of Congress Mar. 3, 1901. It is composed of local clubs in the United States and other countries and its purpose is the enrichment of community life. In addition to local clubs there were, in 1928, 14 national organizations and 64 clubs outside of the United States affiliated with the Federation. It is governed by a board of directors, including representatives from every State, and the work is divided into eight departments: American citizenship; American homes; education; fine arts; international relations; legislation; press and publicity; and public welfare. Activities outside the departments include: extension of the Federation by the organization of rural clubs and junior groups; work for the improvement of motion-picture films and radio programmes; coöperation with war veterans; medical scholarship loan; and exchange Pan-American scholarship. The official publication is the *General Federation News*. Headquarters are at 1734 N Street, N. W., Washington, D. C. Mrs. John F. Sippel was president, and Miss Josephine Judkin, manager of the research and club service.

WOOD, JAMES J. American engineer and inventor, died at Asheville, N. C., April 19. He was born at Kinsale, Ireland, Mar. 25, 1856, and was taken to the United States when he was eight. He was graduated from the Brooklyn Polytechnic Institute in 1878 as a draftsman and mechanical engineer. He had begun to work at eleven, in the employ of the Bradford (Conn.) Lock Company. He early displayed an interest in the problems of arc lighting, and in 1879 designed an arc-light dynamo so efficient that it caused the Fuller Electric Company, which was exploiting the inventions of James B. Fuller, to substitute Wood's machine for Fuller's and to change its name to the Fuller-Wood Company. He was with the company from 1880 to 1885, and from the latter year until his death he was with the Thomson-Houston and General Electric Companies as inventor and consulting engineer. He was the consulting engineer of the Fort Wayne, Ind., works of the General Electric Company. He held 240 patents covering electric and mechanical devices. He designed the dynamo used for flood-lighting the Statue of Liberty in New York Harbor. His name was often associated with those of Thomas A. Edison, Elihu Thomson, and Charles F. Brush, other pioneers in the invention and use of electrical machinery.

WOOD PULP. See **FORESTRY; PAPER**.

WOODROW WILSON AWARD. This honor for distinguished service in furthering good will between nations was conferred, March 19,

upon Col. Charles A. Lindbergh, the distinguished aviator. The first award made by the Woodrow Wilson Foundation was to Viscount Cecil in 1924; the second to Elihu Root in 1926. No award was made in 1927 and the one to Colonel Lindbergh was the third.

WOOL. The high degree of prosperity of the sheep industry in the United States continued in 1928. Demand for wool improved during the year. The number of sheep was 23 per cent greater than at the 1922 low point. The number shorn in 1928 was estimated at 38,364,000, compared with 36,570,000 in 1927. The revised estimate of the U. S. Department of Agriculture for wool shorn in 1928 was 299,113,000 pounds, an increase of 6.1 per cent over the preceding year, due both to an increased number of sheep shorn and a small increase in the average weight of fleece. Texas led all the other States, followed closely by Montana, Wyoming, California, Utah, and Oregon in the order named. The production of pulled wool was 51,900,000 pounds, compared with 50,100,000 pounds in 1927.

The world's wool crop for 1928 outside of Russia and China was expected to be somewhat larger than that of 1927, and about equal to, or a little larger than, the clip of 1926. The number of sheep in the world was increasing, although in several European countries, notably France and Germany, the upward tendency seemed to have been checked. A large share of the increase was in the United States, Canada, and the United Kingdom. In Australia the number declined owing to drought, but subsequent improvement in range and pasture conditions in that country enabled the wool production to be well maintained.

With but little prospect of further expansion of wool production in New Zealand, Australia, and South Africa, there was believed to be opportunity for American wool-growers to place their industry on the best financial basis in its history. This opportunity was believed to lie in breeding sheep which would produce a type of wool the mills demand, maintenance of uniformity from one year to another, and preparation and marketing with the same efficiency that prevails in Australia, New Zealand, and South Africa.

A nation-wide wool pool was planned during the year to handle the crop in 1929. The National Wool Growers' Association approved the recommendation of the wool marketing committee which had been working on a plan for such a pool to handle 50,000,000 to 75,000,000 pounds in 1929, or about one-quarter of the American output. Existing State coöperative and other marketing agencies would be used and others created where lacking. One estimated advantage would be elimination of competition between coöperative selling organizations, placing the central organization in a more advantageous position in trading, and others would come from grading, efficient marketing, etc. A wool institute was inaugurated, with headquarters in New York, patterned largely after the Cotton Textile Institute.

The International Wool Conference met in Paris in November, and appointed a committee to establish an international wool products association, following the example of other large industries. The conference was composed of Great Britain, France, Germany, Italy, Belgium, Holland, and Czechoslovakia. Other wool-producing and wool-handling nations were to be invited to

associate themselves with the international body. The United States was represented at the conference by delegates.

WORCESTER MUSEUM. See ART MUSEUMS.
WORCESTER POLYTECHNIC INSTITUTE. A non-sectarian institution for the technical education of men at Worcester, Mass., founded in 1865. The enrollment for the autumn of 1928 totaled 602, distributed as follows: Mechanical engineering, 133; civil engineering, 81; electrical engineering, 158; chemistry, 55; general science, 1; physics, 1; and freshmen, 173, all of whom take the same course of study. The faculty numbered 68. The productive funds of the Institute amounted to \$2,734,000 and the income for the year to \$314,600. There were 23,000 volumes in the library. President. Ralph Earle, D.Sc., D.Eng., Captain, U. S. N. (Retired).

WORKMEN'S COMPENSATION. In an address delivered before the New York Industrial Safety Congress and Exhibit late in 1927, Ethelbert Stewart, United States Commissioner of Labor Statistics, pointed out that there were a number of serious problems still to be settled in the field of workmen's compensation. There were in operation three forms of insurance, viz., self-insurance, insurance by private companies, and State insurance funds whether competitive or monopolistic. The large employers of labor (these comprise only 2 per cent of the total number of establishments) are self-insurers; another small group has solved its problem by means of mutual companies; while the great majority of plants use private stock companies or the State funds. One of the difficulties of the situation lies in the high accident rate among the small plants with the result that this type of business is unprofitable. For example, in New York State, during the years 1924 and 1925, 25 per cent of the firms insured were paying the minimum rate and for this group the premiums earned totaled 2.14 per cent of all the earned premiums, while the losses sustained were 2.15 per cent of the total losses or 61.8 per cent of the earned premium. Among the group of small plants paying between \$25 and \$50 premium, the losses were 89.8 per cent of the earned premiums. On the other hand, for the plants paying \$30,000 and over in insurance premiums, the total premium earned made up 9.2 per cent of all the premiums against a loss of 7.85 per cent of the losses with a percentage of 52.4 of the premium earned. The result was the increase of prohibited risks on the part of the private stock companies. Some States met the situation by making all risks compulsory, e.g., Arizona and Utah. In other States, where the State funds were on a competitive basis, the small and unprofitable risks had fallen to the State funds with the result that in time the State funds may have to be supported from general taxation.

Mr. Stewart's conclusions were significant; he found that the most profitable risks, i.e., those of the large establishments, are being covered by self-insurance or, what is the same thing, mutual companies; that the high rates that the private companies must charge because they are carrying the greater number of unprofitable risks become prohibitive and end in the elimination of the risks that cannot pay or whose accident rates are high; the result being "a scheme that defeats itself and which in turn reacts upon the operation of the compensation

laws so as partially to defeat them, thus throwing back upon the workers and the community the evils, within this group, for which the compensation laws were enacted. . . ."

COMPENSATION AND WIDOWHOOD. A study in Wisconsin of the remarriage of widows with children, particularly of those rendered widows as a result of industrial accidents, indicated very plainly that, had it not been for workmen's compensation legislation, these families would have become public charges. The study covered the period July 1, 1923, to May 1, 1927, the period of the State's compensation history. The survey found that the remarriage rate was highest during the first year of widowhood, that remarriage directly depends upon the age of the widow and the number of children and that more lump-sum settlements were made proportionately with widows that remarried than with those who did not. The study found only two cases out of 32 remarriages of widows (with children) who were over 37 years of age at the time of their husbands' deaths. Of the 182 widows studied, only 32 were remarried; of the latter, 18 were under 30 years at the time of the death of the husbands. The median age of the remarried widows, at the death of the husbands, was 29 years; the median age of the unmarried widows, at the death of the husbands, was 37 years. The median age of the whole group at the death of the husband and breadwinner was 35 years, an interesting example of the type of family being aided by workmen's compensation legislation.

STATE INSURANCE FUNDS. In previous issues of this YEAR BOOK there have been included discussions of the success of the various insurance funds being operated by the States. There follow here similar data for a number of States: In *New York*, in the calendar year 1927, the State fund wrote premiums to the total of \$7,088,628, an increase of \$138,856 over the previous year. For 1927 the number of policyholders totaled 21,047, an increase of 3586. Since 1922 the State fund's earned premiums have shown greater increases proportionately than the movement of factory payrolls for the same period. For 1927 the *Ohio* State fund reported total assets of \$55,235,467 of which \$46,515,351 was being held as a claim reserve to cover awards on which payment is required over a period of years. During the year, the receipts of the fund made up of earned premiums and interest on the claim reserve totaled \$15,457,320 and the disbursements were \$13,358,270. During the year, premiums were reduced in 25 per cent of the classifications and increased in 22 per cent. It is interesting to note that this State fund uses a system for giving merit ratings, with savings in premiums to employers, based on the number of accidents occurring in their plants.

The following was the condition of the *Pennsylvania* State fund at the conclusion of the year 1927: Gross assets totaled \$8,322,126.72 of which \$4,569,704.24 was reserved for claims, \$1,000,000 was reserved for a catastrophe, and \$2,069,573.13 represented a surplus. The earned premiums for 1927 had come to \$3,700,000, the largest premium income in the history of the State fund. The State fund was established in 1916 and during the 12 years of its existence policyholders paid into the fund \$29,847,966 of which amount \$3,708,594 was returned as divi-

dends, \$500,000 was returned to the State Treasury, and \$15,462,464 was paid out as compensation to workmen and their families. The State fund was not compulsory and its rates were the same as those used by the private companies. However, during 1916-27, the State fund granted 10 per cent reductions from the announced rates. On Jan. 1, 1928, however, the fund officials were advised that it would have to use the same rates as the private companies, but this merely meant that the initial reduction would be converted into a larger dividend.

LEGISLATION. On May 14 the United States Congress enacted a workmen's compensation law for persons employed in private establishments in the *District of Columbia*. This action left only the following States where workers are not protected against industrial accident: Arkansas, Florida, Mississippi, North Carolina, and South Carolina. The District of Columbia's law was modeled on the Federal Longshoremen's Compensation Act (described in the 1927 YEAR BOOK) in that its chief features permitted private insurance companies to write competitive insurance and in that it provided for administration under the U. S. Employees Compensation Commission. Among the States whose legislatures met in 1928, important action for the strengthening of workmen's compensation acts was taken in two. In *New Jersey* amendments were passed raising the \$17 weekly maximum payment to \$20 and increasing the minimum to \$10. Larger benefits were provided for the loss of an arm, hand, thumb, and forefinger. In *New York* the legislature passed an amendment permitting the State fund to extend its province to New York employees coming under the protection of the Federal Longshoremen's Act. Another amendment extended the benefits for compensation to employees working for organizations that were non-profit making. A third amendment provided protection for those injured fatally or otherwise by "direct contact with" a limited number of occupational diseases. Critics did not consider this adequate in the face of the absence of an all-inclusive disease list.

FEDERAL WORKMEN'S COMPENSATION ACT FOR HARBOR WORKERS. The YEAR BOOK for 1927 reported the passage of an act by Congress for the extension of the benefits of workmen's compensation to longshoremen and harbor workers. The act, which was administered by the U. S. Employees' Compensation Commission, met with remarkably little opposition and in the first year of its operation, July 1, 1927, to July 1, 1928, few cases found their way into the courts. The work of the commission was facilitated greatly by the action of two of the most important mari-

longshoreman sued for damages on the ground that the Compensation Act took away his property rights without due process. The Court of Appeals affirmed the lower court's decision that the injured workman's sole remedy was under the Federal law. An amendment to the act was passed by Congress in May authorizing Federal district attorneys to appear as counsel for the commission when it was named as a party in suits involving the law. The *Monthly Labor Review* said of the act in the first year of its operation: "The United States Longshoremen's and Harbor Workers' Compensation Act has been administered during the first year with great foresight and with active coöperation of all parties, with an absence of that spirit that breeds litigation, and with a liberal interpretation acceptable to those concerned."

PHILIPPINE ISLANDS. On June 10 there went into effect the Workmen's Compensation Act that had been passed during the previous year. Its provisions, as analyzed by the *Monthly Labor Review*, are as follows: *Injuries*, all injuries caused by employment, or illness directly caused by employment; *Industries*, all those exercised for gain except agriculture, charitable institutions, and domestic service; *Persons compensated*, all those who receive less than 42 pesos a week and all public employees except those who are elected or who receive more than 800 pesos a year (the peso is worth 50 cents); *Compensation for death*, burial expenses not to exceed 100 pesos, 45 per cent of average weekly wages to dependent widow with additional allowances for children, payments to widow to cease with death or remarriage, payments to children only up to the age of 18, no payment for more than 208 weeks, aggregate compensation not to exceed 3000 pesos; *Disability*, for total disability, compensation not to exceed 3000 pesos in all, for partial disability, the maximum is the same and the maximum weekly allowance is 10 pesos, payments in lump sums are allowed; the employer is not compelled to insure. It will be observed that the maxima are very low, that lump-sum payments are permitted, and that insurance is not compulsory. In these particulars the law is not up to standard.

GREAT BRITAIN. The accompanying table, prepared by the British Home Office, presents the number of accidents that have occurred in the past few years in these industries: mines, quarries, docks, railways, factories, construction work, shipping. In 1925 the total number of persons employed was 7,541,014; in 1926 the figure was 7,001,795. The small number of cases occurring in 1926 is to be attributed to the coal strike.

NUMBER OF COMPENSATED CASES OF INDUSTRIAL ACCIDENTS IN GREAT BRITAIN AND PAYMENTS FOR COMPENSATION, 1919 TO 1926

Year	Number of cases			Payments for compensation		
	Fatal	Nonfatal	Total	Fatal	Nonfatal	Total
1919	3,293	365,176	368,469	£687,477	£3,929,246	£4,616,723
1920	3,531	381,986	385,517	755,517	5,222,352	5,978,009
1921	2,385	283,861	286,246	518,064	4,991,331	5,509,395
1922	2,489	390,428	392,917	546,889	5,948,839	6,495,728
1923	2,657	477,878	480,035	591,164	6,542,932	7,134,096
1924	2,878	437,442	440,320	786,444	5,888,594	6,675,038
1925	3,030	473,055	476,085	864,726	5,778,204	6,642,930
1926	2,345	368,563	370,908	674,611	5,382,310	6,056,921

time States, namely, California and New York, which passed laws for the greater coöperation of State agencies with the Commission. The law's constitutionality was tested in a case before the New York Court of Appeals where an injured

INDUSTRIAL ACCIDENTS. It is important to remember that the passage of workmen's-compensation acts has helped materially in the decrease of dependency. This is brought out clearly in the examination of any table showing the total in-

jured by our industrial society and the amount of compensation necessary to keep alive the families of the injured workers. The following table gives the compensation history of New York State for the two years ending June 30, 1926:

COMPENSATION IN NEW YORK STATE FOR TWO YEARS, ENDING JUNE 30, 1926

Cause	Death or permanent total disability	Permanent partial disability	Temporary disability	Total weeks of disability	Total compensation
Machinery	113	8,717	15,118	591,762	\$ 8,842,691
Hoisting and conveying apparatus	285	1,525	3,201	347,660	3,369,627
Vehicles	508	3,102	12,067	763,107	7,495,851
Explosions, electricity, fire, etc.	268	731	6,841	345,500	3,014,742
Harmful substances	60	222	2,290	90,764	959,979
Falls of persons	534	4,984	26,410	1,089,401	12,919,164
Stepping on or striking against objects ..	33	582	6,751	85,455	1,057,327
Falling objects	188	2,044	9,643	337,665	4,009,609
Handling objects	178	6,844	40,533	627,494	8,779,379
Hand tools	34	2,821	10,800	205,031	3,258,214
Animals	28	229	1,286	52,054	552,919
All other causes	124	1,526	6,819	229,598	2,590,700
Total	2,303	33,327	140,259	4,765,491	\$56,850,202

In order that the reader may obtain an idea of the industrial accidents for which workmen's compensation legislation provides, there is appended here a table showing the kinds of accidents met with in New York State in the fiscal year ending June 30, 1927. Of the total of 98,984 accidents, 1042 ended fatally, 41 were permanent total disability cases, 18,518 were permanent partial disability cases, while the remainder were cases of temporary injuries.

NUMBER OF COMPENSATED ACCIDENTS, COMPENSATION PAID, AND TIME LOST, IN NEW YORK STATE, YEAR ENDING JUNE 30, 1927, BY CAUSE

Cause	Number of cases	Time loss (weeks)	Average weeks lost per case	Compensation paid	Average amount paid per case
Handling objects	27,692	322,648	11.7	\$4,643,260	\$167.68
Falls	18,092	535,411	29.6	6,515,137	360.11
Machinery	18,026	289,001	22.2	4,411,144	338.64
Vehicles	8,897	362,902	40.8	3,809,666	428.20
Hand tools	7,500	107,809	14.4	1,624,835	216.64
Falling objects	6,241	162,795	26.1	1,875,312	300.48
Stepping on or striking against objects ..	4,923	38,975	7.9	521,487	105.93
Explosions, electricity, heat, etc.	3,777	165,775	43.9	1,435,749	380.13
Hoisting and conveying apparatus	2,959	175,899	59.4	1,817,187	614.12
Miscellaneous	2,591	67,929	26.2	794,284	306.55
Harmful substances	1,338	32,816	24.5	358,826	268.18
Indefinite history of accidents	1,257	18,040	14.4	171,952	136.80
Animals	691	18,492	26.8	207,164	299.80
Total	98,984	2,298,492	23.2	\$28,186,003	\$284.75

The above items certainly have called attention to the fact that industrial accidents have not been eliminated despite the fact that industry has been made to pay the bill through the agency of workmen's-compensation legislation. At the annual safety congress of the National Safety Council, held in New York October 4, it was pointed out that industrial accidents were costing the manufacturers themselves five billion dollars annually. Eighty-five per cent of all industrial accidents was preventable if proper safety rules were enforced and 10 per cent was due to improper physical conditions in the plants. See INSURANCE.

WORKS, JOHN DOWNEY. American lawyer, jurist, and legislator, former United States Senator from California, died at Los Angeles, Calif., June 6. He was born in Ohio County, Indiana, Mar. 29, 1847. He received a public-school education and when quite young enlisted in the Union Army in the Civil War, serving eighteen months. He became a practicing lawyer in Indiana in 1868, being at Vevay until 1883, when he removed to California. He had been elected as a

Republican to the Indiana House of Representatives in 1879. His first office in California was that of judge of the Superior Court of San Diego County, 1886-87; from 1888 to 1891 he sat on the bench of the State Supreme Court, and in

1910 he was for a short time president of the City Council of Los Angeles. He was closely identified with the efforts to obtain irrigation for the State, and was also a leader in the clean-up campaign in the State and in the elimination of race-track gambling. He opposed "machine" politics and the Southern Pacific Railway. He had won a reputation as an advocate of social justice and as an independent and progressive Republican when he was elected United States Senator in

1911. As Senator, he often coöperated with the Democrats. He advocated a six-year presidential term, with no reelection. He served only one term in the Senate, 1911-17. He wrote several legal books, besides the following: *What's Wrong With the World?* (1922); *Man's Duty to Man* (1923); *Juridical Reform* (1924).

WORLD AGRICULTURAL CENSUS. See AGRICULTURE.

WORLD COURT. On April 26, the Hon. John Bassett Moore, one of America's leading international lawyers resigned his position as a member of the World Court. Judge Moore held the seat which was considered in League of Nations circles generally to be reserved for the United States. The judges are elected for nine-year terms by the League Council and Assembly together, and Judge Moore's place was filled at the Assembly meeting at Geneva in September, at which time Charles Evans Hughes, a former member of the U. S. Supreme Court and a former Secretary of State of the United States was chosen to succeed him. The vote in the Assembly was: Sir Abdue

Rohin (India) 1; Sir Johannes Wessels (South Africa) 1; Dr. Walter Simons (Germany) 5; Charles Evans Hughes, 41. His vote in the Council of the League was unanimous. Justice Hughes had been first nominated by 26 nations. He will hold the seat for two years, Judge Moore's unexpired term.

The reason assigned for Judge Moore's resignation was that he desired to complete a work in many volumes on international arbitration since the days of the Greeks. This resignation, after seven years of conspicuous service, was viewed not only as a great loss to the Court itself, but as raising wide problems concerning, first, the relationship of the United States to the Court, which again was brought up by Senator Gillett's resolution asking the President to continue negotiations with the other powers concerning America's membership and, second, the Court itself, which by the statute was to be reconstituted in 1930 when the nine-year terms of the original judges were to be completed. The machinery for the election of a successor being set in motion through the drawing up of a list of candidates by nomination of the various national groups of judges at the Hague Court of Arbitral Justice and the final vote was to take place at the Assembly and the Council in September, 1929.

The League Council at Lugano postponed action upon a resolution recommending that a study be made as to whether advisory opinions from the World Court might be requested by a majority vote. Unanimity was required by custom, though not by statute. Apparently, the object of the proposal was to facilitate the entrance of the United States into the Court. The clause in the Senate's fifth reservation to which the other Powers objected provided that advisory opinions should not be asked in any matter in which the United States "has or claims an interest." This had seemed to them like asking a right of veto. This requirement of unanimity would make such a right all the more effective. The requirement of only a majority would nullify American action in this respect.

There were two possible explanations of the action of the Council according to the Philadelphia *Inquirer*. One is that it is opposed to anything which would put the United States in a favored position if it entered the Court. The other is that it considers any change inopportune while diplomatic negotiations with regard to the meaning of the clause are pending.

The effort of United States Senators to bring about the rescinding of the American acceptance of membership in the World Court failed in Congress February 9, by a vote of 59 to 30. The resolution proposed that the United States withdraw its conditional acceptance of the obligation of the Statute of the Permanent Court of International Justice. The British reply on American reservations, received almost simultaneously, used the terms of rejection drawn up at the 1926 conference of states members of the World Court. France, Sweden, Holland, and India have taken similar action.

Professor Anzilotti of Italy was elected President of the World Court for the term 1928-30 succeeding Dr. Huber of Switzerland. The optional clause of the statute of the Permanent Court of International Justice was signed by Greece.

AMERICAN ADHESION TO THE WORLD COURT.
The Senate Committee on Foreign Relations, in

an executive session May 23, voted to defer action until December on the resolution of Senator Gillett, of Massachusetts (see YEAR BOOK, 1927), requesting the President to reopen negotiations looking toward acceptance of the American reservations to acceptance of the protocol of adherence to the International Court of Justice. This action was announced by Senator Borah, of Idaho, chairman of the committee. The vote in favor of deferring action on the resolution was 9 to 8. Republican members, except Senator Gillett and Senator McLean, of Connecticut, voted for postponement. Democratic members, except Senator Pittman, of Nevada, who was absent, and Senator Reed, of Missouri, voted against the motion to defer action. Before the committee agreed to postpone consideration of the resolution, Senator Gillett expressed his willingness to accept an amendment offered by Senator Walsh, of Montana, which would request the President to enter into negotiations with nation members of the League of Nations and of the World Court, to seek to have the Court render a decision as to whether a majority vote or an unanimous vote of the Council of the League is necessary to ask the Court for an advisory opinion. The vote in the Committee on the motion to defer action on the resolution was as follows: Yeas: Republicans (7), Borah, Johnson, Moses, Edge, Capper, Reed, of Pennsylvania, Fess; Democrat (1), Reed, of Missouri; Farmer-Labor (1), Shipstead. Nays: Republicans (2), McLean, Gillett; Democrats (6), Swanson, Robinson, of Arkansas, Walsh, of Montana, Harrison, Bayard, George.

It was explained that Senators Edge and Capper voted to defer action because they wished to see the resolution amended to state that its adoption would not indicate any change in the attitude of the Senate in its insistence upon the fifth reservation at the time it voted for adherence to the World Court. Senator Swanson, ranking minority member of the committee, said after the meeting that the minority, except Senator Reed, of Missouri, had voted against postponement of the resolution because they felt that an expression of the Foreign Relations Committee on the Gillett resolution would be desirable during the present session of Congress. Senator Swanson predicted that, if the Gillett resolution ever reaches a vote in the Senate, it would be adopted.

President Coolidge announced that he intended to resume negotiations in the matter of American adhesion. This intention (on legislation to come before the Short Session) was first expressed at a White House breakfast attended by a number of Republican Senators on November 24. The next day, the press reports of the breakfast generally agreed that Senators present gained the impression that completing the adherence of the United States to the Court was "a matter dear to the President's heart." As the *New York Times* headline put it, he desired to make it the "crowning act" of his administration. The President's initiative, of course, altered the importance of the Gillett resolution which had been scheduled to come up at the first meeting of the Foreign Relations Committee in December.

Pending the result of these negotiations to be undertaken by the Executive, there was naturally no action on the Gillett resolution during the closing weeks of the year. Senator Gillett had asked that it lie in Committee until the result be known. Senator Gillett's own statement of the situation was as follows:

I am delighted at the President's intention to renew negotiations with the other nations to see if some satisfactory basis cannot be agreed upon by which we shall enter the World Court. The sole object of my resolution now pending before the Foreign Relations Committee was to encourage such negotiations and now that he has expressed the desire and purpose to undertake it, I shall let my resolution lie dormant until the result of his action is determined. I presume he recognizes that now that the General Peace Treaty, which has so long engrossed the attention of the State Department, has been generally adopted and the nations have renounced war as an instrument of policy, it is important that a substitute for war shall be provided and that judicial settlement of disputes offers the best hope in that direction. I trust that his efforts will be crowned with success and that his administration will thus have taken two signal steps towards permanent peace among the nations.

Once again the Court showed its usefulness in delivering judgment in the difficult case concerning the admission of children to the German minority schools in Polish Upper Silesia. This case, which had been before the League for some time, involved important questions of minority procedure and its solution should comprise another contribution to the problem of building up a law of jurisdiction for the many racial, religious, and linguistic minorities which must necessarily be found in Europe's variegated racial make-up. This judgment was entered on April 26.

Judgment No. 13, dealing with the merits of the claim for indemnity in the Chorzow case (see previous YEAR BOOK), was handed down on September 13. An Order denouncing the treaty of Nov. 2, 1865, between China and Belgium was published on August 13. Two opinions (Nos. 15 and 16) were delivered during the year. They were with regard to the jurisdiction of the courts of Danzig and the latter interpreting the Greco-Turkish Agreement of Dec. 1, 1926.

WORLD LEAGUE AGAINST ALCOHOLISM. An organization originating in a conference of the Anti-Saloon League of America at Columbus, Ohio, November, 1916, and formally launched in a joint conference of the Canadian Temperance Alliance and the Anti-Saloon League. It met and adopted a constitution in June, 1919, at Washington. The charter members included representatives of sixteen national temperance organizations from twelve countries. The object of the World League is "to attain by the means of education and legislation, the total suppression throughout the world of Alcoholism, which is the poisoning of body, germ-plasm, mind, conduct, and society, produced by the consumption of alcoholic beverages."

The World League is an educational movement, which under its constitution "pledges itself to avoid affiliation with any political party as such, and to maintain an attitude of strict neutrality on all questions of public policy not directly and immediately concerned with the traffic in alcoholic beverages."

The meetings of the League are held triennially, the last one having taken place in August, 1927, at Winona Lake, Indiana. The official League membership in 1927 comprised 56 national temperance organizations from 33 of the leading countries of the world. The work of the League is carried on by executive, legal, publicity, and service departments, with offices at Westerville, Ohio; the research department is located in New York City; the Scientific Temperance Federation in Boston, Mass; the Inter-

collegiate Prohibition Association has its headquarters in the Bliss Building, Washington, D. C. Branch offices are maintained in London, England; Lausanne, Switzerland; Oslo, Norway; and Toronto, Canada. The League has four presidents: Miss Anna A. Gordon, Evanston, Ill., Dr. Robert Herod, Lausanne, Switzerland, the Rt. Hon. Leif Jones, London, England, and Dr. Howard H. Russell, Westerville, Ohio. Dr. Ernest H. Cherrington was general secretary.

WRANGEL, PETER NICHOLAEVITCH. Russian general, died at Brussels, Belgium, April 25. He was born at St. Petersburg (now Leningrad), Aug. 5, 1873, the eldest son of a Baltic nobleman of Swedish descent. He was well educated and was trained as a mining engineer. After serving as a private in the Russian Guards for a year, he went to Siberia in practice of his profession. During the Russo-Japanese War, he was made an officer, and at the close of the war rejoined the Guards. He was an officer in the cavalry when the World War began and distinguished himself in the fighting in East Prussia in August, 1914, winning mention in dispatches and appointment as aide-de-camp of the Emperor. He rose in rank until in 1915 he commanded a Cossack regiment and later a Cossack division. He served in the War until the collapse of Russia. General Wrangel opposed the Bolshevik revolution from its beginning, and, with a volunteer army operating in the Crimea, severely defeated the Soviet forces. He was finally overwhelmed in 1920 by superior forces released for service against him when the Soviets made peace with Poland. He managed to retreat in good order and to transport his men to Turkey, Lemnos, Egypt, Bulgaria, and Jugo-Slavia while the government which he had set up in southern Russia passed away. In 1922 Wrangel had his headquarters in Jugo-Slavia. By 1926 he had given up active opposition to the Soviet régime in Russia, and he accepted employment in Belgium as a mining engineer.

WRECKS. See SAFETY AT SEA.

WRESTLING. Ed. ("Strangler") Lewis gained the undisputed possession of the world's professional wrestling championship in 1928 by winning two out of three falls from Joe Stecher in a match held at St. Louis, Mo. The professional mat game again proved unprofitable, various bouts arranged for New York and other large centres failing to attract much interest.

The Amateur Athletic Union champions for 1928 were: 112 pounds, Gordon Rosenberg, Iowa Falls High School; 123 pounds, Robert Hewitt, University of Michigan; 134 pounds, Allie R. Morrison, University of Illinois; 145 pounds, Clarence Berryman, Oklahoma A. and M. College; 158 pounds, Lloyd O. Appleton, Cornell College, Iowa; 174 pounds, Ralph Hammonds, Texas University; 191 pounds, H. L. Edwards, U. S. Naval Academy; heavyweight, Edward George, University of Michigan. Lehigh University won the Eastern intercollegiate championship, the individual winners being: 115 pounds, Hyman Josephson, Cornell; 125 pounds, Edward Wilson, Penn. State; 135 pounds, Robert Lewis, Lehigh; 145 pounds, Barwell Dodd, Yale; 158 pounds, William Graham, Princeton; 175 pounds, Arthur Lehr, Lehigh; unlimited, Glenn Stafford, Cornell.

WRONG, EDWARD MURRAY, English historian, died February 16. He was born at Toronto, Ont., Apr. 14, 1889, the son of George Mackinnon Wrong, Canadian historian and professor of history at the University of Toronto. The younger Wrong was educated at St. Andrew's College, Toronto, the University of Toronto, and Balliol College, Oxford, winning a first class in history at the last-named institution in 1913. He was made a fellow in modern history of Magdalen College, Oxford, in 1914, the first Canadian to be thus honored. In January, 1915, he won the Beit Prize for colonial history. Ill health prevented his service in the World War. From 1916 to 1919 he was vice principal of the Manchester College of Technology. In 1919 he returned to Oxford as Beit lecturer in colonial history, holding the lectureship until 1924, when he was chosen vice president of Magdalen College. In 1925 he became junior proctor. He published two books, *Charles Buller and Responsible Government* and *History of England, 1688-1815*. English critics declared that Professor Wrong's death cut short what was expected to prove a brilliant career as historian and educator.

WURTTENBERG, vurt'tēm-bērk. A constituent state of the German Republic since November 1918; formerly a kingdom of the German Empire. Area, 7530 square miles; population, according to the census of 1925, 2,580,235. Chief city, Stuttgart, with a population in 1925 of 341,461. The movement of population in 1926 was: Births, 50,419; deaths, 31,323; marriages, 18,351. The chief occupation is agriculture, about 64 per cent of the total area being under cultivation.

The chief agricultural crops with their acreage and production in 1926 were: Wheat, 204,977 acres, 98,211 tons; rye, 71,485 acres, 29,150 tons; barley, 245,752 acres, 122,857 tons; oats, 257,132 acres, 139,010 tons; potatoes, 204,392 acres, 510,540 tons; hay, 1,317,312 acres, 2,617,048 tons; vines, 26,770 acres, 943,118 gallons of wine. The estimated revenue for the year ending Mar. 31, 1928, was 142,200,000 marks; expenditure, 155,600,000 marks. Supreme power is vested in the Landtag, composed of 80 members elected for four years by universal suffrage. This body appoints the state ministry, whose president is styled State President. State President and Minister of Education in 1928, Wilhelm Bazille.

WYLIE, ELLINOR HOYT. American poet and novelist, died suddenly at New York, December 16, at the age of forty-two. Born at Rosemont, Pa., the daughter of Henry Martyn and Anne Hoyt, she attended private schools at Bryn Mawr, Pa., and at Washington, D. C. Having divorced her husband, Horace Wylie, she married William Rose Benét, Oct. 3, 1923. Moving to New York in 1919, she contributed literary reviews to various periodicals, and was, for a time, an associate editor of *Vanity Fair*. Her first book of poems, *Nets to Catch the Wind* (1921), won the Julia Ellsworth Ford Prize, and she received immediate recognition for her imaginative conceptions and precise style, being soon considered, in England and in America, one of the important modern writers. She wrote two other books of verse, *Black Amour* (1923), and *Trivial Breath* (1928). Her novels, *Jennifer Lorn* (1923); *The Venetian Glass Nephew* (1925); *The Orphan Angel* (1927); and *Mr. Hodge and Mr. Hazard* (1928) were also criticized favorably. At the time of her death, Miss Wylie had arranged for

the publication, in the spring of 1929, of another book of poems to be called *Angel and Earthly Creatures*.

WYNN-CARRINGTON, CHARLES ROBERT. See LINCOLNSHIRE, FIRST MARQUIS OF.

WYOMING. POPULATION. According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 194,402. Estimates made as of July 1, 1928, indicated a population of 247,000. The largest city was Casper, which increased from 11,447 in 1920 to 23,288 in 1925. The capital is Cheyenne.

AGRICULTURE. The following table presents the acreage, production, and value of the principal crops in 1927 and 1928:

Crop	Year	Acreage	Prod. bu.	Value
Hay	1928	1,082,000	1,645,000 ^a	\$16,488,000
	1927	1,094,000	1,669,000 ^a	15,021,000
Wheat	1928	243,000	4,098,000	3,388,000
	1927	226,000	4,186,000	3,953,000
Oats	1928	132,000	4,092,000	1,841,000
	1927	120,000	4,320,000	1,814,000
Potatoes	1928	21,000	2,352,000	1,529,000
	1927	17,000	2,329,000	1,630,000
Barley	1928	77,000	2,310,000	1,409,000
	1927	59,000	2,006,000	1,224,000
Corn	1928	167,000	3,006,000	2,254,000
	1927	176,000	3,520,000	2,605,000

^a tons.

MINERAL PRODUCTION. The production of petroleum, the chief item of the State's mineral output, fell off in 1927, particularly in total value. There were produced 21,146,000 barrels of petroleum in 1927, as against 25,776,000 in 1926; in value, \$29,800,000 in 1927, as against \$51,020,000 in 1926. The quantity of coal mined was 6,753,656 net tons in 1927, and 6,512,288 in 1926; the value, \$18,152,000 in 1927 and \$17,827,000 in 1926. The natural gas output was 46,567,000 M cubic feet in 1926 and 45,539,000 M in 1925; in value, \$4,669,000 in 1926 and \$4,149,000 in 1925. Gasoline from natural gas was produced in 1927 to the value of \$2,879,000; in 1926, to \$3,934,000. The total value of the State's mineral products was \$78,988,066 for 1926; for 1925, \$78,754,915.

FINANCE. The State expenditures in the year ended Sept. 30, 1927, as reported by the United States Department of Commerce, were: for maintenance and operation of departments, \$5,406,591 (of which \$2,238,532 was aid to local education; for interest on debt, \$142,360; for permanent improvements, \$2,152,488; total, \$7,701,439 (of which \$2,432,313 was for highways, \$760,226 being for maintenance and \$1,672,087 for construction). Revenues were \$8,823,564. Of these, property and special taxes formed 17.7 per cent; departmental earnings and payments to the State for officials' services, 4.3 per cent; sales of licenses and taxation of gasoline, 16.6 per cent. Assessed property valuation was \$461,685,564; State taxation thereon, \$1,970,843. Net funded State debt was \$1,612,833 on Sept. 30, 1927. Almost the entire outstanding State debt was for highways.

TRANSPORTATION. The total number of miles of railroad line under operation on Jan. 1, 1928, was 1988.14. There were built in 1928, 59.88 miles of additional first track.

EDUCATION. As a move toward the creation of a system for the retirement of teachers with pension, the State Teachers' Association, through a committee, prepared a report on the subject, for submission to the State Legislature when it should convene in 1929. The number of pupils in the public schools made, for the academic year

1928-29, a marked rise over that of the year previous. In 1927-28 the school population of the State (including those between the ages of 6 and 21 years) was placed at 63,841. There were enrolled in the public schools 53,148 pupils. Of these, 42,496 were in the primary schools and 10,644 in the high schools. The expenditure for the year, on public-school education, totaled \$6,128,421.56. Teachers' salaries were approximately as follows: in the rural schools \$700-\$1200; in city elementary schools, \$1125-\$1900; in high schools, \$1350-\$2700.

CHARITIES AND CORRECTIONS. The State Board of Charities and Reform, with which was included the State Board of Pardons, formed in 1928 the agency of the State for the general direction of welfare activities. The Board held authority under the constitution of 1889 and consisted of five ex-officio members, who were the Governor and four other of the chief elective officers of Wyoming. It supervised and controlled all the State's charitable, reformatory and penal institutions, eleven in number, supervised private agencies for the care of children and, as the Board of Pardons, had charge of pardon applications.

The various State institutions and the numbers of their inmates on Sept. 30, 1928, were: State Hospital, Evanston, 402; State Penitentiary, Rawlins, 295; Soldiers' and Sailors' Home, Buffalo, 28; Big Horn Hot Springs State Reserve, Thermopolis; Wyoming General Hospital, Rock Springs; State Training School, Lander, 211; Wyoming Industrial Institute, Worland, 220; Home for Dependent Children, Cheyenne, 190; Saratoga Hot Springs State Reserve, Saratoga; Girl's Industrial Institute, Sheridan, 32; Wyoming Tuberculosis Sanatorium, Basin, 15. The thermal spring reserves, while treated as State institutions, had no regular inmate populations. Blind or deaf wards of the State to the number of twenty-five and five women convicts were boarded in institutions of Colorado, Montana, Nebraska, or Utah.

POLITICAL AND OTHER EVENTS. The State public-service commission granted a certificate to an airway corporation April 5 for commercial flying within the State. The company announced the establishment of routes between Parco and Jackson and between Casper and Sheridan, Cody, Cheyenne, Dubois, and Lander. The site of the engagement of July 29, 1865, between the Connor Expedition and the Arapahoe Indians, near Sheridan, was deeded to the State. A movement was set under way to seek enactment of a State old-age pension, in the next succeeding Legislature, and to do away with the poorhouse system. Construction of a large cement manufactory near Laramie, at an expected cost of \$2,000,000, was undertaken, and a beet factory at Wheatland was projected.

ELECTION. The popular vote of the State in the presidential election of November 6 was: Hoover (Republican), 52,748; Smith (Democratic), 29,299. J. B. Kendrick, Democrat, running for reelection to the United States Senate, was nevertheless elected. V. Carter, Republican, was elected Representative-at-Large.

OFFICERS. Governor, Frank C. Emerson; Secretary of State, A. M. Clark; Treasurer, W. H. Edelman; Auditor, Vincent Carter; Superintendent of Public Instruction, Katharine A. Morton; Attorney-General, W. O. Wilson.

JUDICIARY. Supreme Court: Chief Justice,

Fred. H. Blume; Associate Justices, Ralph Kimball and W. A. Rimer, who filled the unexpired term of C. N. Porter (died Dec. 21, 1927).

WYOMING, BATTLE OF. See CELEBRATIONS.

WYOMING, UNIVERSITY OF. A State institution of higher education at Laramie, founded in 1886. It consists of a college of liberal arts, a college of agriculture, college of engineering, college of education, and a law school. The enrollment for the autumn of 1928 was 1176 classified as follows: Liberal arts, 553; agriculture and home economics, 126; engineering, 149; education, 268; law, 80. The registration for the two summer sessions of six weeks each and the supplementary six weeks' session at Buffalo totaled 1263. The teaching faculty numbered 108 in the autumn term of 1928. The income for 1927-28 was \$971,657 and the productive funds for the same period totaled \$2,074,408. The library contained 70,000 volumes. A new residence hall for men, erected at a cost of \$200,000, was occupied in 1928. President, Arthur Griswold Crane, Ph.D.

X-RAYS. See PHYSICS.

YACHTING. The yachting season of 1928 was made noteworthy by the transatlantic race from New York Harbor to Santander, Spain, with cups given by the King of Spain as the rewards. Twelve yachts, comprising two divisions, sailed from New York on June 30, July 6, and July 7. The competitors were: first division, *Aloha*, bark, owned by Arthur Curtiss James; *Guinivere*, schooner, owned by Edgar Palmer; *Atlantic*, schooner, owned by Gerard B. Lambert; *Elena*, schooner, owned by William B. Bell; *Zodiac*, schooner, owned by R. W. Johnson; *Azara*, schooner, owned by G. F. and F. Baker; *Thistle*, yacht, owned by Robert E. Tod, Second division, *Mohawk*, owned by Dudley F. Wolfe; *Nina*, owned by P. Hammond and E. Root; *Pinta*, owned by W. J. Curtis and L. Rigg; *Santa Maria*, owned by Mauro and Careaga; *Rofa*, owned by William Roos. All the second-division entries were schooners ranging from 50 to 60 feet in length. The length of the first-division fleet varied from 105 feet for the *Thistle* to 218 for the *Aloha*. Never before had such small schooners as made up the second division attempted to cross the Atlantic. Among these little boats, the *Nina* triumphed and then traveled on to Cowes where she captured the Fastnet Cup, a famous British trophy for long-distance racing. The *Pinta* and *Mohawk* each led for a time during the 3000-mile journey and the *Nina's* victory was by a narrow margin. The *Elena* proved the fleetest of the larger craft with the *Atlantic* affording the winner the strongest opposition. The *Elena's* time for 3055 miles was 17 days and the *Nina's*, 24 days. The *Rofa* became dismasted when 800 miles out of New York, but her crew was saved.

In the international six-meter competitions, Clinton H. Crane's United States entry, the *Akaba*, defeated the Norwegian *Figaro V* for the Seawanhaka Cup. The *Figaro V*, however, captured the Scandinavian Gold Cup through defeating Henry B. Plant's *Salcema*. A fleet of American boats received a severe trouncing in races against a Scottish fleet on the Clyde, the weather being too tempestuous for the lighter American craft. In the Star class, *Sparkler II*, owned by Prentice E. Edrington, won the international championship at Newport Harbor, Calif.

The New York Yacht Club cruise attracted the largest number of entries of any year since

the World War. The *Vanitie*, owned by H. P. Whitney, and the *Blackshear*, owned by Frank L. Crocker, captured the two Astor Cups. A technicality cost the *Valiant*, owned by Winthrop W. Aldrich, the King's Cup.

Gar Wood's *Miss America VII* set a new world's record for motor boats at Detroit by averaging 92.838 statute miles an hour in the preliminaries for the Harmsworth Trophy regatta. This boat later captured the trophy. Miss Marion B. Carstairs of England had challenged for the trophy with two boats, but when the contest started her craft sank.

Long-distance outboard racing featured the year's motor-boating competitions, the most important event being the 200-mile race from New York to Boston which was won by C. P. Stevens, Jr., of Albany, N. Y. In an international race in Germany, Miss Helen Hentschel of Whitestone, L. I., captured the Class B championship. See OLYMPIC GAMES.

YALE UNIVERSITY. A non-sectarian institution of higher education at New Haven, Conn., founded in 1701. The university consists of 10 schools, as follows: Undergraduate, Yale College (1701); Sheffield Scientific School (1847); graduate and professional: graduate school (1847); school of medicine (1913); divinity school (1822); school of law (1824); school of fine arts (1866); school of music (1894); school of forestry (1900); school of nursing (1923). Since 1920 the undergraduate freshman year has been under the jurisdiction of a separate dean and faculty. The enrollment for the autumn of 1928 was 5743, including 718 who were not candidates for degrees or certificates. Of those working for degrees or certificates, 649 were in the graduate school; 1630 in Yale College; 669 in the Sheffield Scientific School; 890 in the freshman year; 208 in the school of medicine; 217 in the divinity school; 318 in the school of law; 327 in the school of fine arts; 115 in the school of music; 39 in the school of forestry; and 70 in the school of nursing. There were 45 research fellows working on the various foundations. The registration for the summer session of the school of law was 73.

The faculty of the University numbered 1186, and included 222 of professorial rank, 63 associate professors, 159 assistant professors, 234 instructors, and 508 assistants. The library, including the departmental library, contained 1,902,512 volumes and pamphlets. The total endowment was \$58,024,459 and the income for the year, \$5,960,665. As a result of concerted effort on the part of graduates in 1926-27 the endowment was to be increased by gifts and pledges totaling \$20,993,918.

The completion of the Brady Memorial Laboratory in 1928 increased the laboratory facilities of the school of medicine, as did the completion of Lauder Hall, and Farnam Memorial Building on the grounds of the New Haven Hospital. Construction was begun on the Sterling law buildings, to provide lecture rooms, offices, library accommodations, and dormitory facilities for 238 men, under provisions made by the trustees of the estate of the late John W. Sterling of New York; while Charles W. Bingham Hall, a dormitory, was completed for occupancy; and the first wing of the Gallery of Fine Arts was opened in the autumn of 1928. (See ART MUSEUMS.) The Phipps Polo Field and the Charles E. Coxé Memorial (Yale Field Gymnasium) were com-

pleted during the year; new baseball stands were erected; and the Walter Camp Memorial entrance to Yale Field was dedicated in November.

Among the gifts received during the year were the following: A bequest of \$60,000, or more, under the will of Mrs. Jessie L. Ward, of Brooklyn, N. Y.; \$350,000 from Mr. and Mrs. Philip B. Stewart, of Santa Barbara, Calif.; Albert Cowles of Chicago, and Mr. and Mrs. William H. Cowles of Spokane, to establish the Alfred Cowles Foundation for the study of government, in memory of their father; an addition to the original endowment of \$11,000 for the Alexander Kohut Fellowship for research in Semitics, from the donor, Dr. George Alexander Kohut, of New York, bringing the amount up to \$20,000, under which Dr. Ettaline M. Grice was enabled to carry on her work in compiling a thesaurus of Babylonian and Assyrian cuneiform signs, until her death in 1927, after which the work was undertaken by Prof. Ferris J. Stephens.

Under the direction of Prof. Michael I. Rostovtzeff, Yale University participated in excavations at Doura, on the Euphrates, in co-operation with the French Académie des Inscriptions, and in Transjordan, where, in co-operation with the British School of Archaeology in Jerusalem, the half-buried city of Gerasa was being restored to the view of travelers in Palestine and was yielding material for exhibitions at Yale and for research work by historians and archaeologists. Scholarships at Yale were granted in the autumn of 1928 to 80 members of the student body, representing 20 States, the District of Columbia, England, and China. Exercises, including the dedication of new buildings, were held in the autumn to mark the opening of the Berkeley Divinity School formerly of Middletown, Conn., which is affiliated with Yale University, although it has no formal connection with the Yale Divinity School. President, James Rowland Angell, Ph.D., Litt.D., LL.D.

YAP. A Japanese island of the Caroline group in the Pacific, centre of administration for the western Carolines; an important wireless and cable station. Population, 7752.

YELLOW FEVER. THE AFRICAN OUTBREAK. The situation in respect to this disease was not very satisfactory in 1928; for while it was dormant in the Western Hemisphere it had undergone a recrudescence in a large part of its original stamping ground on the west coast of Africa (see YEAR BOOK for 1927). There were originally two foci, in Senegal on the one hand and Dahomey, Togoland, and the Gold Coast on the other. After the death of Professor Stokes, of the Rockefeller Commission, at Lagos, in Nigeria, in 1927, the direction was taken over by Noguchi himself (see NOGUCHI, H.), who succumbed to the disease at Akkra, Gold Coast, in 1928 and this event was, in turn, succeeded by the demise from the same cause of Prof. Wm. A. Young (see YOUNG, W. A.). In the Fall of 1927, the French Colonial Government took a hand in the crusade against the disease and by December it had been suppressed throughout French West Africa, including Senegal and Nigeria. In April, 1928, a conference of French, British, and Americans was held at Dakar, in Senegal. Some doubt had been cast by certain pathologists on the spirochetic origin of the disease, based partly on important differences between the American and African types of yellow fever; and the un-

timely death of Noguchi deprived him of the opportunity of replying to his critics. He himself, however, admitted the existence of differences which extended to the microorganisms attributed to the two forms.

NEW EPIDEMIC IN BRAZIL. According to a bulletin dated July 17, 1928, quarantine officers in all ports south of Norfolk, Va., were warned against vessels clearing from Brazil where yellow fever had broken out with 87 cases and 29 deaths. Of this number, 79 of the cases and all of the deaths were reported from Rio de Janeiro, and all of the cases were reported from the coast, nothing being known as to conditions in the interior. The disease evidently represented a flare-up from an old focus and not an importation, such as might in theory have come from West Africa. The yellow-fever mosquito is abundant in southern Brazil and it is evident that some species of animal can harbor the germ of the disease in its blood and that under certain circumstances this mosquito can convey it to human beings. There is evidence that species of monkey serve as reservoirs in Africa. It is also possible that human beings themselves immune may serve as reservoirs or carriers of the disease.

NOGUCHI'S SPIROCHETE NOT THE CAUSE OF AFRICAN YELLOW FEVER. The consensus of opinion of numerous students of African Yellow Fever during the recent outbreak of the disease was that it was not due to the organism isolated and cultivated by the late Dr. Noguchi from subjects with American yellow fever and named by him *leptospira icterodes*. Investigators have gone back to the old belief that the disease is due to a filter-passing virus. It is most unfortunate for science that Noguchi was unable to go over the ground and reply to his critics who, not satisfied with their first break with his views, went so far as to insist that Noguchi's organism was identical with the *spirocheta icterohemorrhagica*, long regarded as the cause of epidemic jaundice, a disease which bears some relationship to yellow fever. The problem has now resolved itself into one of animal experimentation. The monkey known as *Macacus rhesus* is peculiarly susceptible to the disease, and the unknown filter-passing virus can be recovered from the blood or blood serum, from the liver, etc., of the infected animal. An emulsion of liver will keep indefinitely by freezing and the disease can be set up in the monkey at will and also counteracted by the use of human convalescent blood and an anti-serum prepared by injecting the virus into animals immune to the disease. Apparently, it has not yet been tested on mankind because for the time being the disease has died out.

YEMEN, IMANATE OF. See ARABIA.

YESHIVA COLLEGE. The first college of liberal arts and science in the United States under Jewish auspices, aims to afford its students a harmonious combination of secular and Jewish studies, a union of the culture and faith of Israel's age-old heritage with the culture and knowledge of the present-day world; for men only. The Rabbi Isaac Elchanan Theological Seminary (the Yeshiva) was chartered in New York, in 1896, and later absorbed the Etz Chaim Talmudic Academy, the oldest Jewish day school in the United States, chartered in 1886; and by amendment to the charter, in 1928, the Yeshiva became known as the Rabbi Isaac Elchanan Theological Seminary and Yeshiva College and was authorized to offer courses leading to the baccalaureate degrees.

The freshman year of the College began its work in the autumn of 1928, with an enrollment as follows: Senior seminary, 142; junior seminary, 235; teachers' institute, 135; college (freshman year) 31. The faculty numbered 31. The income for the year was \$142,000. The library contained 17,000 volumes and a collection of manuscripts. On Dec. 9, 1928, a group of buildings, including the main building, the auditorium, and the dormitory, with accommodations for 1500 students and 200 resident students, was dedicated at Amsterdam Avenue and 186th to 188th Street, New York. The next group to be erected provides for a new library and the Museum of Jewish Art and Archaeology. A building campaign carried on yielded over \$2,700,000 and additions were made to the endowment fund. President of the faculty, Bernard Revel.

YIDDISH. See JEWS.

YORK, EDWARD PALMER. American architect, died at New York, December 30. Born at Wells-ville, N. Y., in 1865, he attended the Cornell architectural school, 1887-89. He was then employed for eight years by McKim, Mead & White, working much of the time directly under Stanford White. He later became a member of the firm York & Sawyer, which designed a number of important New York buildings, notable for their modern geometric lines, including that of the New York Historical Society, the Guaranty Trust Company, and the Fifth Avenue Hospital. Among Mr. York's other work are buildings at Vassar, Smith, and Rutgers, Riggs National Bank, at Washington, D. C., and the Custom House and Courts Building at Honolulu, T. H. His company acted as consulting architects for the Treasury Department at Washington, 1909-13, and Mr. York's designs for the Department of Commerce Building in Washington were accepted a short time before his death. York & Sawyer were also the advisers for the Board of Water Supply of New York City.

YOUNG, THE REV. JOHN B. An American organist and reformer of church music, died at Monroe, N. Y., September 26. He was born in Alsace, Oct. 30, 1854. One year after his ordination, in 1879, he became connected with St. Francis Xavier's in New York City, and almost immediately turned his energy toward reforming the character of the music then in vogue. For the purpose of giving adequate performances of the masterpieces written in a capella style, he personally trained a boys' choir, which soon became famous. Associated with him in this noble work were three of America's greatest organists, B. O. Klein, C. Dethier, and Pietro Yon. Fortunately, Father Young lived to see his labors come to full fruition through the establishment of a worthy standard of church music in both Catholic and Protestant churches in America.

YOUNG, WILLIAM ALEXANDER. English director of medical research in West Africa, died at Accra, West Africa, in June, at the age of thirty-eight. His death was the result of yellow fever contracted in the course of an investigation of that disease that was being carried on by the Medical Research Institution of the Gold Coast, of which he was director. It followed within eight days the death of Dr. Hideyo Noguchi from the same cause; in 1927 another colleague, Dr. Adrian Stokes, also died of the disease. Dr. Young's work was done in close collaboration with that of the Rockefeller Commission in West Africa.

He was educated at Forfar Academy and University College, Dundee, Scotland (St. Andrew's University). He joined the West African Service in May, 1913, and was sent to Sierra Leone. During the World War, he served with the Cameroon Expeditionary Force, and in 1920 joined the staff of the Medical Research Institution in Nigeria. Three years later, he went to the Tsetse Fly Commission in Nigeria, and in 1924 was transferred to the Gold Coast; in the same year he was appointed head of the Medical Research Institution. See YELLOW FEVER.

YOUNG MEN'S CHRISTIAN ASSOCIATION. An educational, social, physical, and spiritual movement for men and boys found in every civilized nation of the world. This organization originated in London in 1844, then spread to the United States in 1851. The records as of June 1, 1928, showed 1,601,957 members throughout the world, 62 per cent of whom was in North America; 7396 employed officers, 73 per cent being in America; and \$242,636,000 net in Association property, of which 80 per cent was in North America. In 1928 the movement in North America involved 1616 local organizations recognized by the convention with 90,736 directors and voluntary leaders, 5475 paid officers, and a paid-up membership of 1,007,119, of whom 271,739 were boys 12 to 17 years of age. Five per cent of this body of workers and members was found in the Canadian associations and the remainder in the associations of the United States. Statistics as of June 1, 1928, showed \$226,877,900 net of property and funds paid in. Of this amount, \$24,853,800 was in endowment funds. The operating expenditures for 1928 were \$59,276,800, or more than \$1,140,000 per week. These expenditures were provided for by members and friends, the latter group contributing \$16,196,200 to the total.

The Y. M. C. A. movement involves several hundred features or lines of service. During the year ending Apr. 30, 1928, 610,402 men and boys were enrolled in its physical training and service activities, and 300,000 men and boys in its educational features, including lectures, discussions, evening schools, and regular college courses, both day and evening classes. There were 79,388 enrolled in regular courses of instruction covering from two to four years in length and of college grade, a number equal to all the male students in all the colleges and universities of the United States having an enrollment of less than 2700 each. In addition, there were numerous activities and organizations and clubs, besides the regular Sunday and devotional services and courses in Bible study, for the development of the spiritual life of the members. During the year, 208,715 students were enrolled in the Bible courses, while the total attendance at religious meetings of the Association amounted to 5,651,500. The work of the Association in the 32 foreign countries to which it had been extended was carried on by 869 local and national secretaries, partially supported by a budget of \$1,986,200 (included in total expenditures above) from the associations in North America.

The Association maintained three colleges in the United States, for the professional training of secretaries and paid officers, at Springfield, Mass., enrollment 531 students; Chicago, Ill., 309 students; and Nashville, Tenn., 110; and nine summer schools, lasting from three to four weeks each, with a total enrollment in 1928 of 1223. In

addition to hundreds of bulletins of various kinds, issued by the State and local associations, there were the following international periodicals for the North American associations: *Association Men*, monthly; *The Intercollegian*, monthly; *The Student World*, quarterly; *Physical Training*, monthly; and *The Association Forum*, quarterly. On Jan. 1, 1925, with the formation of the National Council of Canada and the National Council of the United States to supervise and promote local and State activities, the International Committee became a holding organization for the two councils, retaining, however, an active interest in the foreign work supported by the two councils. The headquarters and officers of these three organizations were as follows: The International Committee, 347 Madison Avenue, New York; James M. Speers, chairman, Dr. John R. Mott, general secretary; The National Council of the United States, 347 Madison Avenue, New York; D. W. Teachout, chairman, Dr. John R. Mott, general secretary; the National Council of Canada, 40 College St., Toronto, Ont., R. F. McWilliams, chairman, H. Balantyne, general secretary. In October, 1928, Fred W. Ramsey of Cleveland, Ohio, was chosen by the National Council to succeed Dr. John R. Mott, in 1929, as general secretary.

YOUNG WOMEN'S CHRISTIAN ASSOCIATION. An organization and movement of which the purpose is to advance the physical, social, intellectual, and spiritual interests of young women, to promote growth in Christian character and service and to be a social force for the extension of the Kingdom of God. Its national organization holds a biennial convention to which all affiliated associations send delegates. The 1928 convention was held in Sacramento, Calif., in April. The national executive organization is known as the National Board of the Young Women's Christian Associations. To it is entrusted the work of the national body during the interim of conventions.

In the United States in 1927, there were 1141 associations, of which 1001 were affiliated with the national organization. In addition to these, however, there were 900 to 1000 branches and centres. (For example, the Y. W. C. A. of the City of New York operated 18 branch centres in Manhattan and the Bronx and yet was counted as a single association in the above figures.) There were also 400 clubs of young girls in unorganized territory registered with the National Girl Reserve Department of the National Board, with an approximate membership of 22,483 girls. The total membership list in affiliated associations according to the 1927 figures was 591,574 girls and women; total expenditures by local associations for yearly current expenses totaled \$25,000,000. The value of real estate property owned by these local associations approximated \$60,000,000. Y. W. C. A. educational classes in 1927 had an enrollment of 340,064 girls, and the enrollment in clubs for recreation, study, and other activities was 273,528. In 309 Y. W. C. A. cafeterias in the United States during the same period, 28,687,948 customers were served. The number of girls and women who obtained positions through Association employment bureaus in the United States was 165,064; and the number of girls assisted in finding rooms, 136,849. The total number of girls and women who were housed in the 243 Association residences throughout the United States attained 594,765.

In the group of 48,849 women who served as board and committee members during the year, assisting in management, raising funds, and aiding professional Y. W. C. A. staffs, the Association had one of the largest bodies of women working as volunteer assistants in any organization. The national organization supervises and aids 37 Y. W. C. A. centres in 12 foreign countries and appropriates annually a large budget for the assistance of these units, in which 106 women, "American women secretaries," as the Y. W. C. A. professional workers are called, were maintained. The national organization receives its support from quota contributions from affiliated associations, the amount received from this source in 1927 being \$942,625. The remainder of the 1927 expenditures, or \$2,346,113.60, was received from gifts or from income from its \$2,571,921.22 endowment. The approximate value of the National Board's property was given as \$4,328,440. The officers of the National Board in 1928 were: Mrs. Robert S. Speer, president; Mrs. John French, chairman of the executive committee; Mrs. John H. Finley, first vice president; Mrs. John D. Rockefeller, Jr., second vice president; Miss Katharine Lambert, secretary; Mrs. Samuel Murtland, treasurer, and Mrs. George W. Davison, assistant treasurer; Miss Helen A. Davis, who was acting general secretary following the death of Miss Mabel Cratty in February 1928, became second associate general secretary late in the year, following the appointment of Miss Anna V. Rice as general secretary of the National Board of the Y. W. C. A., and of Miss Emma Hirth as her associate.

The National Board operates through the three regional offices in Chicago, Ill., Denver, Colo., and San Francisco, Calif., and its headquarters are at 600 Lexington Avenue, New York City, and adjoining is the Y. W. C. A. National School for Professional Study, at 135 East 52nd Street.

YUAN-HUNG, LI. See LI YUAN-HUNG.

YUKON, yoo'kón. A territory of the Dominion of Canada; bounded on the west by Alaska and stretching from British Columbia to the Arctic Ocean; constituted a separate political unit in 1898. Area, 207,076 square miles; population, 4157, according to the census of 1924; estimated in 1925 at 3500. The chief towns are Dawson, the capital, and White Horse. Mining is the principal occupation and the chief minerals are gold, copper, silver, lead, and coal. The output of gold in the year 1926 was valued at \$879,819 and of silver, at \$796,921. The revenue for 1927 was \$228,442 and the expenditure \$216,964. At the head of the government is a gold commissioner and a territorial council of three elected members. Gold Commissioner in 1928, Percy Reid.

ZANZIBAR. A British protectorate consisting of the island of the same name off the coast of Tanganyika in East Africa, together with the Island of Pemba and several other small islands. Area, Zanzibar, 640 square miles; Pemba, 380 square miles; population, according to the census of 1924, 216,790 (Zanzibar, 128,099; Pemba, 88,691). The total number of children attending schools in 1926 was 3407. The prevailing religion is Mohammedanism. Zanzibar, with a population in 1924 of 38,700, is one of the chief ports of Africa. The chief industry is the production of cloves, the two islands of Zanzibar and Pemba yielding the greater part of the world's supply. The exports in 1926 were 158,425 cwt., and clove-

stems, 39,550 cwt. The coconut industry ranks next in importance to cloves; the export of copra amounted to 347,080 cwt. in 1926. The value of imports in 1926 was £1,633,551; exports, £1,585,884; revenue in 1927, £544,083; expenditures in 1927, £642,292; tonnage entered and cleared in 1926, £1,238,892 net tons. The nominal head of the government is the Sultan, but the actual administration is in the hands of a British Resident, who is aided by an advisory council under the presidency of the Sultan. The Sultan's decrees are not binding unless countersigned by the British Resident. Sultan in 1928, Seyyid Khalifa bin Harab; British Resident, A. C. Hollis.

ZINC. The output of primary metallic zinc from domestic ores in the United States in 1928 according to the U. S. Bureau of Mines was about 582,100 tons and that from foreign ores was about 12,400 tons, a total of 549,500 tons, as compared with 576,960 tons from domestic ores and 15,556 tons from foreign ores, a total of 592,516 tons, in 1927. In addition to the output of primary zinc, there was an output of about 52,100 tons of redistilled secondary zinc, as compared with 42,784 tons in 1927, making a total supply of distilled and electrolytic zinc in 1928 of about 646,600 tons, composed of 238,200 tons of high-grade and intermediate, 80,100 tons of select and brass special, and 328,300 tons of prime Western zinc. Of the total output of primary zinc in 1928, 160,000 tons were electrolytic zinc produced in Montana and Idaho, 105,000 tons were made in Pennsylvania, 104,000 tons in Illinois, 103,000 tons in Oklahoma, and the remainder in Arkansas, Indiana, Kansas, Texas, and West Virginia.

The imports of slab zinc in 1928 amounted to only 3 tons. The exports of slab made from domestic and foreign ores amounted to 29,582 tons, including 4325 tons of rolled zinc. The stock of zinc reported at smelters December 31 was about 40,000 tons. The apparent consumption of primary zinc in 1928 was about 578,000 tons, as compared with 516,371 tons in 1927.

The total number of retorts at the 21 zinc smelters that operated during all or a part of the year was about 107,000. Of that number, about 63,400 were reported in operation at the end of November and about the same number was estimated in operation at the end of the year. At the end of 1927, there were 77,388 retorts in operation at these 21 plants.

Figures published by the American Metal Market gave an average quoted price of 6.03 cents a pound for prime Western zinc at St. Louis in 1928, as compared with an average selling price for all grades in 1927 of 6.4 cents. At the opening of the year, the quotation was 5.65 cents a pound and the quotation throughout December was 6.35 cents a pound. The following are the average monthly prices on prime Western zinc at St. Louis, in cents a pound:

January	5.62	July	6.20
February	5.55	August	6.25
March	5.63	September	6.25
April	5.76	October	6.25
May	6.04	November	6.27
June	6.16	December	6.35

ZIONISM. See JEWS.

ZIWET, ALEXANDER. German-American mathematician and educator, died at Ann Arbor, Mich., November 18. He was born at Breslau,

Germany, Feb. 8, 1853, and was graduated from the Polytechnic School at Karlsruhe in 1880. He moved to the United States in the same year, and worked until 1886 on the Government Lake Survey at Detroit, and on the Coast and Geodetic Survey at Washington. He was appointed instructor of mathematics at the University of Michigan in 1888, becoming acting assistant professor in 1890, assistant professor in 1891, junior professor in 1896, and professor in 1905. He retired in 1925, having been successively at the head of both the modern language and the engineering and mathematical departments. Professor Ziwet translated into German the Russian, I. Somoff's, *Theoretische Mechanik*, 2 vols. (Leipzig, 1878-79). He became editor of the *Bulletin of the American Mathematical Society* in 1892, and he wrote the following books: *An Elementary Treatise on Theoretical Mechanics*, part i; *Kinematics*, part ii (1893); *Introduction to Dynamics, Statics*, part iii (1893); and *Kinetics* (1894, revised 1904).

ZONING. See CITY AND REGIONAL PLANNING.

ZOOLOGY. The British Association for the Advancement of Science met in Glasgow, Sept. 6 to 13. As reported in *Nature*, no zoological programme was arranged. The American Society of Zoologists met at New York City, in affiliation with the American Association for the Advancement of Science, December 27 to 29, and the American Society of Naturalists met at the same place on December 29, for the annual symposium on "The Neuromuscular System." The Fourth International Congress of Entomology was held at Cornell University, Ithaca, N. Y., August 12 to 18, with Dr. L. O. Howard as president. The Thirty-second meeting of the German Society of Zoologists was held at Munich, May 29 to 31.

Darwin's cottage at Down, announced earlier (see YEAR BOOK for 1927), as acquired for a national memorial, was to be furnished as nearly as possible as it was when occupied by Darwin, and the library is to contain editions of all of his works. It was to be open to the public, without charge, six days in the week.

EXPERIMENTAL WORK. Huxley (*Am. Nat.* 62, p. 363) found in the results of experiments on echinoderm larvæ, corroboration of his theory that the dedifferentiation of the larval tissue is a stimulus leading to the process of metamorphosis into the adult form. The larval tissues are, so to speak, antagonistic to the adult, and the latter develop slowly in the presence of the former. Larvæ forced to dedifferentiate by the use of $HgCl_2$ metamorphosed much more rapidly than did the controls. It is generally held that secondary sex characters and sex behavior develop under the stimulus of hormones sent out by the growing sex cells. Avel (*Comptes Rendus*, 187, p. 67) found that in the earth worms, *Allobophora*, the clitellum would appear even after complete removal of all sex organs (ovary, testes, seminal vesicle, and seminal receptacles). Castreated annelids would copulate, and in some cases form cocoons in a normal fashion though these latter contained only albumen and no eggs. In this case it is obvious that secondary sex characters are entirely independent of the germ cells. Stotle (*Biol. Zent.* 48, p. 273) investigated the conditions under which hydra changes from the sexual to the asexual generation. He decided that temperature, oxygen content of the water, hydrogen ion content of the water, have no direct influence, though abundance of food is a deter-

mining factor in bringing on the sexual phase. Some effective internal metabolic force, coöperating with oxygen and temperature conditions, produce the change of phase.

Taylor (*Physiolog. Zööl.* 1, p. 1) reported that in the regeneration of a protozoön, *Uronychia*, there is the same absorption and loss of cirri, followed by their reappearance, that occurs during and after ordinary division, thus a dedifferentiation followed by a redifferentiation. He states that this follows on even minor injuries, illustrating the great degree of coördination existing between different parts of the same cell. The author follows Child in maintaining that dedifferentiation is a process of distribution of accumulated products of metabolism through the protoplasm; redifferentiation is a reforming of new materials to take their places and an elimination of the old. This process occurs during the periodic reorganization of protozoa and probably also in the mitotic division of metazoön cells.

As earlier reported (see YEAR BOOK for 1927), some very startling results were obtained in fruit flies by the use of the X-rays. Muller found that rayed flies mutate much more frequently than controls, so that although the mutations might be identical with mutations which have normally appeared in the laboratory, in some cases these mutations appeared 150 times as frequently as they had done in untreated cultures. In addition, other new mutations appeared. At the 1927 meeting of the American Association for the Advancement of Science, Curtis, in the vice presidential address before the section of zoology, called attention to such use of the X-rays as offering a new technic for the experimental analysis of living matter. Experience had shown that X-rays often exert an action upon one part of the cell and have no effect on others, thus showing a definite selective power. This is obviously the end attempted by other methods (action of chemicals, microdissection, etc.), but should, when the technic is properly perfected, be a much more delicate and reliable tool than any of the others. As an illustration, Curtis referred to his own results on regeneration in planarians. Here he found that some species have a much more rapid and complete regenerative power than do others. Microscopical study showed that in the mesenchyme of the planarian are certain peculiar cells which he calls "formative." They show little differentiation and Curtis thought that they were essentially germ cells, carrying the undifferentiated germ plasm. In planarian species which regenerate rapidly, these cells are numerous, in those with feeble regenerative powers, they are few. This led to the conclusion that they are especially concerned in regeneration. Curtis found that, if planarians are treated with X-rays, these cells disintegrate and that planarians thus treated largely lose their power to regenerate. Since none of these treated animals lived very long, the possibility remains that some essential structure other than the formative cells was affected and thus the results so far obtained are not fully conclusive. They are, however, suggestive of the possible importance of this method in experimental zoology.

Hance (*Scientific Monthly*, 27, p. 264) showed that if dark-colored mice are treated with X-rays the hair will come in white, and that this fact affords a method of determining whether the dark color is homo- or hetero-zygous. Dark

being the dominant color, the two conditions are indistinguishable to the eye. If however, the minimal amount of strength of ray that will produce any change is used, the homozygous dark hair is more resistant than the heterozygous.

As stated in earlier YEAR BOOKS, recent research in Zoölogy had developed very largely along experimental lines, Cunningham, well known as an exponent of the Lamarckian theory of evolution, discussed these tendencies in *Modern Biology* and criticizes especially the Mendelians and Biophysicists as dealing entirely with the organism as an engine in motion without any reference to the past or the future of the organism in question. He considers that in so doing, they are ignoring important problems of adaptation, recapitulation, etc. This book of Cunningham's seems to indicate the beginning of a movement back to the older morphological studies which have seemed in recent years to be of such subordinate importance.

In opposition to the pure mechanists, Conklin (*Science*, 68, p. 463) speaks of the tropism theory of all animal reactions as one of several "crude, older theories" and argues for the existence of definite ends as well as definite means in nature. "Certainly from the standpoint of life, the biologist is warranted in assuming that this is a world of teleology as well as of mechanism."

Mutations which appear in the fruit fly under laboratory conditions are, in the great majority of cases, recessive to the normal structure, and there is little evidence that a reversion to the normal ever occurs. In a few cases where this reversion has seemed to happen, it has been explained as due to other causes such as unequal crossing over and not to true changes of the genes. Hanson (*Science* 67, p. 562), working in Muller's laboratory, got results which he thought ruled out the explanation of unequal crossing over and demonstrated that a reversion to the normal may take place under experimental conditions. Male flies carrying, among other mutational characters, the "bar" eye, were subjected to X-rays and it was found that in 1 out of 433 cases this reverted to normal "round." Regarding this reversion as a true mutation, this proportion of mutations is extremely high and the chances that the reversion was caused by anything but the X-ray treatment are very few. Hanson notes that the efficient dosage producing this mutation is one that is just under that producing complete sterility. Hanson and Heys (*Science* 68, p. 115) reported on quite similar results produced in fruit flies treated with radium. These showed that radium will produce lethal mutations in fruit flies, and that the "gamma" rays alone will do the same thing. This is regarded as a step toward the analysis of just what elements in radium and X-rays are responsible for the observed results.

At the 1927 meeting of the American Association for the Advancement of Science, the \$1000 prize annually offered for the most noteworthy paper read at the meetings was awarded to Muller for the work on X-rays which was mentioned above.

EVOLUTION. Agitation against the teaching of evolution in publicly endowed institutions continued throughout the year, though the only definite legislative action was that taken in Arkansas, where at the time of the presidential election on November 6, voters were asked to vote "yes" or "no" in a referendum on the question "Shall

it be unlawful, in educational institutions supported in whole or in part by the State, to teach that man has ascended or descended, from a lower order of animals." The majority vote was in the affirmative. A high official in the public-school system of Arkansas, was later reported in the public press to have said that, because of the nature of the definitions of evolution given in them, this law rules standard dictionaries and encyclopædias out of the schools. Although laws against the teaching of evolution were in force in Tennessee and Mississippi, it was stated that, no attempt had been made, since the Scopes trial in 1925, in Tennessee, at enforcing the law. Chief Justice Greene, of Tennessee, in an address before the American Association for the Advancement of Science, at Nashville, stated that no one knows what the law really means. Of some value to the opposition was the discovery that the supposedly human tooth found in Nebraska and used by Osborn in his argument with Bryan, was really not human, and hence valueless in this connection.

Crampton had carried on a very extensive study of snails belonging to the genus *Partula*, in islands of the western and southern Pacific Ocean, securing data concerning some 400,000 individuals. One of the objects of the research was to get information bearing on the question of the method of evolution in this genus. He concluded (*Science*, 67, p. 615) that structural gradations in *Partula* are so gradual that, beginning with a species, finer and finer subdivisions can be arranged down to the smallest, which he calls the gens, "composed of all individuals that are alike in at least one distinguishable quality." He argued that we cannot understand the origin of species, genera, etc., if we study them only after they have appeared, but must concentrate on the "initial episode when they present themselves as different from their parents." "Therefore, the geneticists alone are working on the fundamental dynamics of organic differentiation," and Crampton's results entirely support the belief of the geneticists that evolution is through the accumulation of variations which owe their origin to some internal force, and are not at all dependent on external agencies. The fixing of the variations in permanent gens, etc., results through natural selection. *Partula* offers absolutely no evidence in favor of orthogenesis.

HEREDITY. (See also under *Experimental Work*.) Davenport (*Sci. Month.* 27, p. 225) reported on the results of a study of race crossing in Jamaica, this being a summary of a more extended article on this subject. Davenport found that in black-white crossings, the best of the brown show some of the highest intellectual qualities, while the worst are worse than the worst of either pure race. A population of the hybrids between black and white would contain some members having a greater musical ability than would any of the pure whites. It would be entirely possible to develop desirable qualities by controlled matings, but this would be impractical in dealing with man. Lotsy and Goddign published in *Genetica* (x, p. 131) observations on race crossing in South Africa where there have been extremely complicated and comprehensive racial crossings. They concluded that hybridization in man often results in extreme diversity but that sometimes stable complexes result. They found no evidence for mutation as the mode of

origin of human races, though new races may result from the segregation of hybrids.

Gray (*Brit. Jour. Exp. Biol.* 6, p. 26) argued that the acquisition of an outer skin which is relatively impermeable to water was essential for the evolution of terrestrial vertebrates. An aquatic amphibian, if exposed to the air, loses water very rapidly, while a terrestrial reptile does not, the difference being that in the latter there is an outer covering through which evaporation takes places with difficulty. Adaptation to a terrestrial life also involves the acquisition of an egg that can be incubated on land. The developing egg needs water which in the aquatic vertebrate is supplied from the surrounding medium. In this reptile and bird, this comes from the albumen of the egg. The mammal condition may be derived from the reptile by supposing that the aqueous solution is poured directly into the embryo instead of being collected around the egg (as albumen).

CeLENTERATES. Setchell (*Science*, 68, p. 119) agreed with earlier writers in crediting the formation of coral reefs more to the algae growing in them than to the corals, thus the term "coral reef" is largely a misnomer. Corals are really passive symbionts in the complex making up the reef. Since algae may grow to very great depths, the assumption made by Darwin that fringing, barrier, and atoll reefs are progressive stages in development due to a sinking of the ocean bottom does not necessarily hold, that assumption being based on the observation that corals have a very limited depth range. Studies on coral reefs should therefore not be based on the behavior of corals but of the calcareous algae which are their chief component. Edmondson (*Bull.* 45, Bernice P. Bishop Museum) reported on the ecology of a Hawaiian coral reef. The corals of this locality vary somewhat in their reaction to temperature but resist lowering better than raising of the temperature. Planulae will stand increased temperature changes better than will the adult animals, this possibly being due to the fact that the planulae are pelagic and swim near the surface of the water. Corals will stop feeding when the temperature gets within a few degrees of its upper or lower limit, and many species will die if deprived of sunlight.

CRUSTACEA. Owing to their habit of attaching to ship's bottoms and thus mechanically obstructing the speed of vessels, barnacles have a considerable economic importance. The larvae are free swimming and anything that would discourage their attachment to the vessel would be of distinct advantage to the shipping industry. Following experimental work on animal tropisms various suggestions have in the past been offered along these lines. Visscher and Luce (*Biol. Bull.* 54, p. 336) reported that certain colors act in a repellent fashion to the young barnacles in the "cypris" stage and that light green is the most decidedly repellent of the colors tested. The conclusion follows that ship's bottoms will be less apt to be attacked by barnacles if they are painted light green. Visscher (*Biol. Bull.* 54, p. 327) reported that the larvae of several species of barnacles which he studied orient themselves with anterior end away from the light. They attach at first, by using both antennae and legs, these organs being at first used for exploring the surroundings before being employed as holdfasts.

INSECTS. It was discovered some years ago

(see YEAR BOOK for 1925) that termites are able to digest cellulose through their symbiosis with flagellate protozoa which live in their intestines. Cleveland (*Biol. Bull.* 54, p. 231) reported on further investigations and showed that in the family *Termitidae* this symbiotic relation is generally absent, occurring in only a few species. This indicates either that these species are losing their protozoa or that they are beginning to acquire them. Cleveland was inclined to accept the former interpretation. Andrews (*Am. Nat.* 62, p. 63) stated that in the vicinity of the nests of *Formica exsectoides*, the common, mound-building ants of the eastern United States, trees are, apparently deliberately, killed by the insects. There is a considerable literature connected with this subject and some authorities have decided that the trees are killed by the ants in order to prevent undesirable shading of the nest since the colonies thrive best in open spaces. Andrews, studying these animals in Maryland, concluded that this is not the reason, since trees will be attacked which would not be in a position to shade the nest. He thinks the habit merely illustrates a general tendency of the insects to attack anything which is near the nest. The mode of attack is by biting combined with the spraying of the wood with formic acid. This habit has economic importance because, in plantations of young trees, it may cause the death of considerable numbers. Rau (*Biol. Bull.* 54, p. 503) reported the finding of drops of nectar in the nest cells of several species of the wasp, *Polistes*. This material was evidently intended as food for the young, though not in a position where the young could reach it unaided. It appears rather to be a convenient storage place where the adult wasp can easily find it when it is necessary to feed the young. Rau thought that the primitive wasps were honey feeders and that the habit of catching insects is a more recent development. Holmquist (*Physiol. Zool.* 1, p. 325) described hibernation in the mound-building ants, *Formica ulkei*. On the approach of winter, they go down deeper into the ground, mostly living at a level where the temperature is constant. Where the water level varies, they go up or down in accordance with it. The respiratory activity of hibernating ants is about one-third of that of the normal, and Holmquist was unable to find any indication of heat production in them. Their water content was lower than that of insects kept in the laboratory. Hibernation seems to be in direct response to lowered temperature and is not in any sense rhythmic. A considerable number of other insects hibernate in the upper part of the nest, when this has been vacated by the ants.

Snodgrass (*Smithsonian Misc. Coll.* 81, p. 3) published a very detailed discussion of the origin and evolution of the insect head and its appendages. He concluded that the arthropods have been derived from creeping, not swimming, animals and their immediate progenitors were annelid-like in structure. The preoral part of the embryo is the prostomium and forms the primitive head to which is later added six somites, of which the fourth, fifth, and sixth at first form a "gnathal" region, while the thorax is differentiated as a locomotor portion of the body. All of the primitive arthropod appendages were (probably) uniramous walking appendages, and the mouth parts have been derived from appendages having this structure. He considers that the biramous append-

age found in the crustacea is a secondary adaptation to a swimming mode of life.

Weyer (*Zeit. f. Wiss. Zool.* 113, p. 345) studied the germ glands in worker ants and found that they were present in all of the ants studied, and were never rudimentary, the chief differences between workers and queens being in the decided changes in the worker ovaries during the course of the life of the individual. In the worker ant, the eggs develop to the time of yolk formation in much the same fashion as in the queen, but later degenerate and are absorbed. The germ glands of *Formica fusca* and *Camponotus ligniperda* workers have undergone a change of function and have become organs of metabolism. It is probable that these changes going on in the germ glands of the workers account for the fact that they have greater vitality than the queens.

Reisinger (*Biol. Zent.* 48, p. 162) described the cataleptic condition assumed by an Indian insect, *Dixippus morosus*, which condition may be induced either by light or by mechanical stimuli, and Reisinger thinks that this has a definite protective function for the animal. If narcotized while in the cataleptic condition, the catalepsy ceases. Shannon (*Science*, 68, p. 461) records a case of abnormal food habits in moths. The observations were made in the Argentine, where moths belonging to four families and eleven species were found feeding on the eye secretions of horses. Shannon suggested that, while the region is moist and it could not be water they were after, the great scarcity of flowers in this locality might have driven the moths to seek their food in this abnormal fashion. Other flower-feeding insects in this locality feed on carrion and fecal matter, which would favor the above explanation. It is possible that the salt in the eye secretion may also be an attraction.

Many insects have mechanisms for producing sounds, and the orthodox explanation has been that these sounds have a definite significance to the insect, their probable use being as sex calls. This interpretation has, however, been disputed, notably by Fabre. An argument in favor of the theory that insects can hear was the observation that numbers of insects will often "chirp" in unison, it being claimed that unless they could hear one another they could not keep up the observed synchronism in the production of sounds. The fact that insects have structures which appear to be adapted for receiving sound vibrations also bears on this problem. Fulton (*Sci. Monthly*, 27, p. 552) experimented on snowy tree crickets in which the (presumably) auditory organ is located in the leg. He found that while uninjured insects would sing in unison, if the leg were cut off, which in the insect is not a sufficient mutilation to cause shock reactions, this synchronism ceases, although the insects continue to make the noise. This seems to indicate that in the absence of auditory sensations, they are unable properly to time their sound production.

MOLLUSCA. Orton (*Nature*, 121, p. 352) stated that the oyster becomes sexually mature as a female early in the summer, and later changes to become male in the same season. At the end of the female phase, the gonoducts become filled with cells. Orton suggested that while some of these cells are phagocytes, cleaning up the passages, others are really new germ cells coming in from other parts of the body, and invading the germinal epithelium. This opens an interesting question as to where these new cells come from, or

where they are located before they come into the gonad.

According to the report for 1927 of the San Francisco Marine Piling Committee, shipworms of the genus *Xylotria* have been a source of loss in San Francisco since 1849 and in 1873 *Limnoria* made its appearance. These two genera are limited to waters having considerable salinity. In 1914 the European genus, *Teredo navalis*, got into this harbor and because of its adaptability to fresher waters, became especially abundant in the upper part of the harbor, where it did much damage. These all may be guarded against by the use of reinforced concrete piling or by creosoting wooden ones.

Grave (*Biol. Bull.* 55, p. 260) reported on an exhaustive study of the natural history of the shipworm, *Teredo navalis*, at Woods Hole, Mass., where it has occurred for many years. The breeding season in this locality extends from about May 10 to October 10 and there is no evidence of a lunar periodicity in any part of the season. The time of development from egg to metamorphosis is approximately five weeks, of which half is spent in the brood pouch in the maternal gills, and half as a free-swimming veliger. From metamorphosis to sexual maturity is six weeks or two months, adult size being reached in one year, the animals dying during the second year. The absolute size of an individual depends entirely on the amount of crowding of the burrows in infested timbers. If lobster pots and small timbers that are infested by the shipworms are taken from the water and allowed to dry in the sun, in from ten days to two weeks, the *Teredos* will all be killed. Since most of the infection occurs in July and August, this is the best time for this treatment.

Jatzenke (*Biol. Zent.* 48, p. 1) reported results of investigations on the biological significance of the mantle fluid of fresh-water clams. This fluid, which was subjected to an exhaustive chemical analysis, proved to be practically identical with the blood of the clam, and its function seems to be to act as a medium between the blood and the outside water. In marine organisms, the blood is isosmotic with the surrounding sea water and in analogous fashion the blood of the fresh-water lamelibranch is surrounded with an isosmotic fluid (mantle fluid) in which constancy of osmotic pressure is maintained by the filtration of excess of fresh water. Oxygen is not absorbed by the liquid of the mantle cavity but by the amoebocytes in it. Dakin (*Proc. Royal. Soc.* 103, p. 355) described the structure of the eyes of the scollop, *Pecten*, and of related genera. He concluded that there is so much diversity in the degree of development of these organs in related genera that it is not possible to explain them as arising through selection. *Spondylus*, which is sedentary, has eyes as well developed as those of *Pecten*, which is free living. It is possible, however, to explain the conditions in *Spondylus* through the fact that it had a free-swimming ancestor.

Nelson (*Biol. Bull.* 55, p. 180) stated that the pelagic larvæ of the mussel, *Mytilus edulis*, which fail to secure attachment at the proper time, are kept afloat considerably longer by the secretion of a gas into the mantle cavity. Through the use of holdfasts secreted on the surface film of the water, or by the use of the foot or tentacles of the siphon on this film, the larvæ may be transported for considerable dis-

tances. This gives this mussel a much wider choice in the selection of a place for fixation than is the case in other mollusks, which are entirely dependent on the conditions in their immediate neighborhood at the end of the larval period, and probably explains why *Mytilus* has such an unusually wide distribution.

REPTILES. An expedition was sent in 1928 by the New York Zoological Society to collect and study the giant tortoises of the Galapagos Islands, whose threatened extinction makes such study important at this time. The expedition was under the direction of Dr. C. H. Townsend, who collected and brought away for colonization elsewhere 180 specimens. These were located at the Botanical Gardens in the Panama Canal Zone; at the San Diego Zoological Society; at the Boyce-Thompson Arboretum in Arizona; in San Antonio and Houston, Texas; in New Orleans; and at the aquarium in Bermuda. The species collected was probably *Testudo guntheri*.

Morrison (*Nature*, 122, p. 684) reported that in young adders (*Vipera berus*) no toxic secretion is formed in the saliva until the third day after birth, but that it then appears with its maximum toxic powers.

BIRDS. Allard (*Am. Nat.* 62, p. 385) discussed the problem of bird migration and noted that the Glacial Epoch theory has held a prominent place in migration theories. As for the notion that when driven south by advancing ice the birds retained a memory of their northern home and returned to it on the recession of the ice, Allard thought that this might have occurred if it had all happened in a single generation, but that the process was so slow that no such social inheritance could have arisen. Calling to mind the demonstrated effect of violet rays on the nutrition of animals, Allard thought that possibly the final solution may lie in further study of the effects of light, especially the longer and shorter day, in stimulating a restlessness. There would still remain the question why the bird follows certain directions in migrating. This is possibly a tropism, but is not yet understood.

MAMMALS. According to Struthers (*Jour. Mammalogy*, 9, p. 300) the life history of the porcupine was very imperfectly known prior to this publication of his observations on the animals in their natural environment in northern

New Hampshire and in confinement in cages at Syracuse University. Mating takes place in November. In captivity and probably also in nature, the female makes the advances and there is little or no competition among the males. The gestation period is 16 weeks and normally only one young is born at a birth. The young at birth is sparingly covered with hair, but the quills appear on the second day and in a week are one-quarter of an inch long. The young can walk at birth and one climbed to the top of its cage on the second day. Nursing lasts for only about a week and the young then begins to feed on the normal diet of apples and bark. In spite of the fact that the size of the litter is so small and that there is only one litter a year, the number of the animals may be very considerable in any one locality. Struthers thought this is because, aside from man, the porcupine has in these localities practically no enemies; because of the nature of its food, it does not compete with any other animals for food; and because it lives to a relatively old age, it has a long period of sexual activity.

McGillivray (*Geog. Mag.* 54, p. 741) observed an individual beaver in northern Michigan which proved especially easy to study and photograph. A part of the beaver's dam was torn out each night and the animal was watched the next day while it made repairs. Larger sticks were first brought in as "studding" for the repair work, and material floated down from up stream to fill in behind this and complete the dam. Finally, clay and mud were dug up just above the dam and used as chinking material to fill the crevices. When obliged to go some distance for logs, the beaver always dug a ditch to the locality in question, though perfectly capable of dragging the logs overland. This was interpreted as a measure of safety, for if surprised by a carnivorous enemy the beaver could escape by water but would be unable to do so on land.

ZOSMA, KING. See ARCHEOLOGY.

ZULULAND, 26°16' S. lat. A portion of the Province of Natal in the Union of South Africa, to which was annexed Dec. 30, 1897. Area, 10,427 square miles; population, in 1911, 219,606. There are extensive sugar plantations, sugar output being in 1924-25 161,250 tons. See SOUTH AFRICA, UNION of, for the statistics on Natal.
